Final Brick Air Toxics Rule Retains 'Health-Based' Emissions Standards

EPA's final air toxics rule setting maximum achievable control technology (MACT) for the brick and clay products manufacturing sector retains controversial proposed "health-based" emissions limits for certain pollutants that the industry has long lobbied for but which environmentalists oppose, setting a potential precedent for other EPA air rules.

EPA Steps Up Passenger Vehicle Tests In Wake Of VW Emissions Scandal

EPA and California officials are stepping up its laboratory and on-road testing of vehicle emission controls in diesel and other passenger cars to search for pollution control "defeat devices" like those Volkwagen (VW) used in its four-cylinder diesel vehicles, devices that are now raising doubts about the fuel economy and greenhouse gas performance of the vehicles.

Ozone Lobbying Ramps Up As EPA Prepares To Issue Stricter Air Standard

Public health advocates, industry groups and others are ramping up lobbying trying to sway EPA on the outcome of its imminent decision on whether to make its ozone national ambient air quality standard (NAAQS) stricter, with the agency widely expected to tighten the existing 75 parts per billion (ppb) limit down to at least 70 ppb.

State Air Officials Seek Prompt Implementation Guide For EPA Ozone Rule

A group representing air regulators from 18 states is urging EPA to promptly issue guidance on how states should implement the agency's pending revision to its ozone national ambient air quality standard (NAAQS), highlighting concerns among the states about a potential stricter standard and new regulatory burdens it could trigger.

CLIMATE:

China rolls out cap and trade, tops U.S. aid pledge

Jean Chemnick, E&E reporter

Published: Friday, September 25, 2015

Six years ago when cap-and-trade legislation was working its way through Congress, its foes warned the emissions scheme would put U.S. industry at a disadvantage because China wouldn't follow suit.

But China has turned the tables, announcing a cap-and-trade plan today for its greenhouse gas emissions while there's nearly no chance for the United States to do the same.

And the world's second-largest economy also said it would provide $3.1 billion in climate finance to poor countries, topping the U.S. pledge of $3 billion over four years.

The announcement of China's climate moves by President Obama and Chinese President Xi Jinping at the White House today follows their joint commitments last year on post-2020 greenhouse gas emissions and is aimed at influencing the United Nations' climate talks in Paris this December. Pope Francis called for a strong agreement in an address today at the United Nations (*see related story*).

"Last year's joint announcement was about setting targets," a senior White House official said. "And this year is about showing the world our countries' conviction to implement policies to reach those targets and to lead the world toward a durable global climate agreement."

For the United States, the agreement reaffirms commitments the Obama administration has already made. U.S. EPA's Clean Power Plan rule for curbing power-sector emissions and Obama's pledge to the United Nations' Green Climate Fund are both highlighted.

But Xi's commitment is grabbing most of the world's attention as he puts China on a path to a sweeping new emissions-trading system beginning in 2017 that will cover the bulk of his nation's economy.

Building on seven regional carbon markets that are already in operation, the Chinese program will cover industries that are not currently regulated for carbon in the United States: iron and steel, chemicals, building materials, and paper manufacturing.

China will also respond to EPA's existing power plant rule with its own steps to curb utility pollution, both through emissions trading and by introducing a "green dispatch" plan that will boost the role of renewable energy in its power grid and require dispatchers to draw first from the most efficient, lowest-emitting fossil fuel power plants, thus accelerating the retirement of older, dirtier units.

Obama and Xi hope to provide the needed boost that will allow the Paris talks to deliver an agreement. Last November's joint announcement by the world's two largest carbon emitters was credited with raising ambition during last year's U.N. talks in Lima, Peru.

The two presidents will also seek to contribute more directly today to the U.N. negotiations by announcing some new areas of agreement on what such an accord should look like.

They agree that the post-2020 emissions reduction targets countries have put forward ahead of Paris that will form the basis of the negotiations are "crucial steps in a longer-range effort to transition to low-carbon economies" and that they should be increased over time.

The leaders also called for the development of midcentury strategies for the transition to low-carbon economies "mindful" of the goal of keeping warming less than 2 degrees Celsius above preindustrial levels. The targets that countries have offered ahead of Paris are expected to fall short of that threshold.

And like last year's U.S.-China accord, today's language will further break down the U.N. process's traditional firewall, which governs the responsibilities of developed and developing nations. This is a goal long sought by U.S. negotiators but opposed in the past by large developing emitters.

China's pledge underscores that effort because historically, only developed countries have been expected to provide financial resources. The pledge will not move through the Green Climate Fund -- which will provide $10 billion by 2020 to help poor countries cope with warming and limit their own emissions.

A White House fact sheet says the $3.1 billion will be made available "through a bilateral fund designed to help developing countries combat climate change."

The grant, which is China's most significant to date, will be "consistent" with the U.S. Green Climate Fund pledge, the fact sheet said. This might mean it will follow the same guidelines laid out for the U.N. fund.

A White House official said it was important that responsibilities under the new accord be based on a country's actual capabilities rather than on what those capabilities were two decades ago when the process began.

If developed countries are required to constrict their emissions but large developing countries like China are not, that would place industries based in the developed world at a competitive disadvantage, the official said.

"There is necessarily a concern by countries all around the world that their partners and their competitors are treated in a way that's fair, and fair one to the other," he said.

If businesses based in the developing world, he said, are covered "in a kid-gloves category where less is expected simply because they are in that category, that's not a prescription for support at a political level in any developed country."

China today also pledged to "strictly control" its support for high-emitting fossil fuels projects, including in other countries. The United States has already severely restricted its support for overseas coal-fired power projects.

The United States and China also agreed to issue rules for heavy-duty vehicles and to take action to curb methane and hydrofluorocarbons, which remain in the atmosphere for a short time but can be far more climate-forcing than carbon dioxide.

POPE FRANCIS:

'Any harm done to the environment ... is harm done to humanity'

Lisa Friedman, E&E reporter

Published: Friday, September 25, 2015

UNITED NATIONS -- Pope Francis brought his global campaign for social justice and climate action to New York today, telling heads of state from around the world that harming the environment is akin to

harming humanity.

Greeted by cheers and chants of "Papa! Papa!" as he entered the General Assembly Hall, the pope made his way slowly to the front of the room and greeted the largest gathering of leaders in the history of the United Nations in his native Spanish with a simple "good morning."

Unlike his speech to Congress yesterday in which the Catholic spiritual leader avoided the words "climate change," even as he challenged U.S. lawmakers to "courageous actions" on behalf of the environment, Pope Francis today explicitly made the case for action (*Greenwire*, Sept. 24).

"We Christians, together with the other monotheistic religions, believe the universe is the fruit of a loving decision by the Creator, who permits man respectfully to use creation for the good of his fellow men and for the glory of the Creator. He is not authorized to abuse it, much less to destroy it," the pope said to loud applause.

Speaking to a packed hall that included German Chancellor Angela Merkel, as well as Sen. Edward Markey (D-Mass.) sitting next to Samantha Power, the U.S. ambassador to the United Nations, the pope called for a "fundamental and effective" international climate agreement in Paris in December.

He also linked the effort to protect the environment directly with alleviating poverty. Referencing his landmark encyclical on the environment, Francis also denounced consumerism and what he called "a culture of waste" that goes hand-in-hand with fueling poverty and destruction of the environment.

"A selfish and boundless thirst for power and material prosperity leads to both the misuse of available natural resources and to the exclusion of the weak and disadvantaged," the pontiff said.

Meanwhile, he argued, the environment's needs must be treated on a par with mankind's.

"It must be stated that a true 'right of the environment' does exist," he said. "Any harm done to the environment, therefore, is harm done to humanity."

Leaders emerging from the General Assembly hall had high praise for the Pope's words on the environment. Rachel Kyte, special envoy for climate change at the World Bank, said she hopes his words will resonate with negotiators charged with hammering out an accord in Paris.

"At the end of the day negotiators are human beings. At the end of the day heads of state are human beings," she said. "Who knows how that gets translated."

Environmentalists also honed in on the pope's message.

"As he addressed the nations of the world today, the pope could not have been more clear about the moral obligation we all have to act on climate immediately, and a key way to do just that is to secure a 'fundamental and effective' agreement in Paris this December," said Michael Brune, executive director of the Sierra Club.

"Pope Francis' emphasis on the fact that the climate crisis and the crisis of biodiversity 'can threaten the very existence of the human species' ought to serve as a wake-up call to politicians around the world who are standing in the way of action," he said.

After his U.N. speech, Francis visited the World Trade Center memorial, where he met families of 9/11 victims and emergency responders and participated in an interfaith prayer service.

AIR POLLUTION:

EPA boosts auto emissions testing after Volkswagen scandal

Sean Reilly, E&E reporter

Published: Friday, September 25, 2015

U.S. EPA officials today said they are ramping up emissions testing across the auto industry, seeking to regain public confidence after last week's revelation that Volkswagen had gotten away with cheating for years.

In a letter sent today to all car manufacturers, the agency said it may require testing on any vehicle under real-world driving conditions with the goal of detecting "defeat devices" similar to what VW has admitted to using on four-cylinder diesel-fueled vehicles from model years 2009 through 2015.

Although improved air quality over the years shows the existing regulatory framework is working, "we must continue to improve and adapt our oversight, and we will," Janet McCabe, EPA's acting air chief, told reporters in a conference call this morning.

The agency is collaborating with the California Air Resources Board and its Canadian counterpart, Environment Canada, to test VW diesel models already on the road for the defeat devices, said Chris Grundler, director of EPA's Office of Transportation and Air Quality.

EPA and California regulators are also working closely with Volkswagen, Grundler said, to come up with "recall solutions" for the 482,000 VW and Audi diesel vehicles covered by the violation notice issued Friday. Affected models include the Jetta, Beetle, Golf, Audi A3 and Passat.

The scandal, which could cost Volkswagen billions of dollars in fines just in the United States, has already forced the resignation of Martin Winterkorn, the CEO of Volkswagen AG, and led the company to ask German prosecutors to open a criminal investigation. Replacing Winterkorn is Matthias Müller, the current chairman of Porsche AG, Volkswagen's board announced today.

It also has raised questions about the adequacy of EPA's testing regimen, given that the cheating was uncovered not by its staff, but by West Virginia University researchers working for the International Council on Clean Transportation, a private nonprofit group.

On today's call, Grundler said EPA had developed the testing technology used by the West Virginia researchers, adding that the agency has focused its real-world testing on heavy-duty diesel trucks that generate far more nitrogen oxide emissions than light-duty cars. The software Volkswagen used to circumvent emissions requirements was buried in 100 million lines of code, he added.

At the Safe Climate Campaign, which has been critical of the existing regimen, Director Dan Becker said the added testing announced today makes sense but is "only a very initial step."

"EPA is going to have to move to bring testing in-house," Becker said in a phone interview. "They are going to have to essentially take the automakers out of the process of doing self-testing, then reporting some of the results -- or false results -- to EPA."

In an email, a spokesman for the Alliance of Automobile Manufacturers, whose members include VW's American arm, would only say the trade group is certain that all carmakers will review the new EPA guidance.

In a statement, a spokeswoman for the Association of Global Automakers, the trade group representing many foreign car manufacturers -- although not Volkswagen -- said "the integrity of the emissions and fuel economy testing certification process is very important to our industry," adding that it will keep working with state and federal regulators to ensure "that the process achieves the objectives of the regulators, manufacturers, and consumers."

APPROPRIATIONS:

House expected to pass 'clean' spending bill, avoid shutdown

Daniel Bush, E&E reporter

Published: Friday, September 25, 2015

House Speaker John Boehner's decision to retire next month should pave the way for Congress to pass a short-term funding bill next week and avoid a government shutdown, House lawmakers said today.

Lawmakers said the Ohio Republican's surprise announcement today clears a path for GOP House leaders to push through a "clean" stopgap spending bill, known as a continuing resolution, or CR, that doesn't include a provision to defund Planned Parenthood.

"I expect we'll pass a clean CR" next week, House Appropriations Chairman Hal Rogers (R-Ky.) told reporters.

House Minority Whip Steny Hoyer (D-Md.) echoed Rogers, saying he expects the spending measure to reach the House floor next week. "I expect that Tuesday [the Senate] will send us a bill, and I expect that bill to be clean," Hoyer said. "I would hope that we can pass that."

The House will likely pass a Senate-backed bill that would keep the government open through mid-December, instead of voting on new legislation, Rogers said.

"The likelihood is it'll be [the Senate's bill]," Rogers said.

Boehner was facing a revolt from the House GOP's conservative flank, which wants to pass a spending bill that would strip Planned Parenthood's federal funding.

But lawmakers on both sides of the aisle said they were optimistic Boehner would bring a clean CR to the floor now that he no longer has to worry about angering his GOP critics.

Averting a government shutdown would allow the country to "move beyond where we are right now, which is incredible uncertainty," New York Rep. Joseph Crowley, a member of the House Democratic leadership team, said in a brief interview.

Still, Crowley said a short-term funding bill wouldn't address a Democratic demand that Congress lift sequester-level spending caps.

"We still have to deal with the issue of sequester," Crowley said.

The Senate is scheduled to vote on its spending bill next week. The House timeline is less clear. Congress must act by Sept. 30 to stop the government from running out of funding.

Reporters Geof Koss and Hannah Northey contributed.

REGULATIONS:

House passes NEPA fast-track review bill

Kevin Bogardus, E&E reporter

Published: Friday, September 25, 2015

The House today passed legislation that would speed up environmental reviews.

H.R. 348, or the "Responsibly and Professionally Invigorating Development (RAPID) Act of 2015," would establish hard deadlines for proposed energy and infrastructure projects that undergo National Environmental Policy Act reviews.

The bill passed 233-170 on a largely partisan vote in the lower chamber. Only seven Democrats ended up voting for the legislation.

The RAPID Act, sponsored by Rep. Tom Marino (R-Pa.), has been part of a package of bills pushed by Republicans that take aim at the Obama administration's regulatory authority. Democrats as well as environmental and public interest groups have blasted the bills as weakening key protections for public health and safety.

Republicans touted the legislation on the House floor today before the House approved it. Rep. Bob Goodlatte (R-Va.), chairman of the House Judiciary Committee, said the RAPID Act would help get construction workers in need of work back on the job.

"It is exactly what our private- and public-sector leaders have called for. It is what millions of American workers yearning for new work and higher wages need," Goodlatte said.

GOP lawmakers also toughened up the legislation's anti-regulatory stance.

Rep. Paul Gosar (R-Ariz.) offered an amendment that would ban agencies from using draft NEPA guidance issued by the White House Council on Environmental Quality. The document has angered Republicans because it calls on agencies to consider climate change as part of their NEPA reviews.

The Arizona lawmaker said his "common-sense" measure would protect jobs by stopping agencies from "being forced to follow job-killing and unlawful draft guidances" that lead to cap-and-trade mandates.

In response, Rep. Debbie Dingell (D-Mich.) read an excerpt from Pope Francis' address to Congress yesterday in which he discussed lawmakers' responsibility to stop the destruction of the environment.

"I take that call by our pope very seriously," Dingell said. "By considering this bill and this amendment, Congress is not playing a constructive role."

Democrats' opposition to Gosar's amendment, however, was not enough to stop it; the provision passed the House on a 223-186 vote.

Several amendments offered by Democrats to change the bill fell flat on the House floor.

One measure, offered by Rep. Scott Peters (D-Calif.), would have struck the bill's language that stops agencies from using the social cost of carbon in their environmental reviews.

"My amendment rejects the false choice between a prosperous economy and a healthy climate. We can and we must have both," Peters said.

Marino opposed the amendment, calling the social cost of carbon rule "junk science."

"Its political function being to make renewable energy look like a bargain at any price and fossil energy look unaffordable no matter how cheap," Marino said.

Peters' amendment failed in a 179-229 vote.

Marino's bill also found success last year. The House passed the legislation in March 2014 (*E&ENews PM*, March 6, 2014).

The RAPID Act, however, will likely not go much further than the House this Congress. Last week, the White House issued a veto threat against the legislation (*E&E Daily*, Sept. 17).

AIR POLLUTION:

Public health groups make late push for tighter ozone limit

Amanda Reilly, E&E reporter

Published: Friday, September 25, 2015

Public health advocates this week made a last-minute plea for a more stringent national ozone standard as U.S. EPA nears an Oct. 1 court-ordered deadline to choose a final new limit for the air pollutant.

In a letter to EPA Administrator Gina McCarthy, the American Thoracic Society and New York University's Marron Institute of Urban Management urged the administration to lower the national standard from its current level of 75 parts per billion to 60 ppb -- the low end of the range recommended by EPA's scientific advisers.

According to the groups, a 60 ppb standard would prevent 6,408 premature deaths annually compared with current ground-level ozone concentrations.

"Administrator McCarthy, the fate of thousands of lives annually rests on your decision," ATS and the NYU institute wrote in the letter dated Wednesday and circulated late yesterday.

Ground-level ozone is a key component of smoggy air that's formed when nitrogen oxides and volatile organic compounds react in the presence of sunlight.

EPA last November proposed to tighten the standard to between 65 and 70 ppb based on a review of public health data but said it would take comment on a level as low as 60 ppb. The agency's final rule is at the White House Office of Management and Budget for interagency review.

According to the letter from the public health advocates, a 70 ppb standard would result in 3,752 more premature deaths a year than a 60 ppb limit.

"The lives of 3,700 Americans are too important for EPA to ignore," ATS and the NYU institute wrote.

The Los Angeles area stands to gain the most from a 60 ppb standard when considering avoided premature deaths, according to the groups. A 60 ppb limit would prevent 619 deaths in the area compared with current ozone concentrations, the groups said.

ATS and the institute told McCarthy they planned to soon release a more detailed report on potential lives saved by a tighter ozone standard. The report is unique from EPA's estimates of the benefits of a tighter standard, they said, because it does not taken into account reductions in ozone caused by other air regulations.

Business and industry groups have waged an aggressive campaign against a tighter standard, warning of potential high compliance costs.

AIR POLLUTION:

Industry, states ask court to scrap MATS rule

Amanda Reilly and Robin Bravender, E&E reporters

Published: Friday, September 25, 2015

Several states and industry groups yesterday asked a federal court to toss out the Obama administration's landmark standards for reducing mercury pollution at coal-fired power plants.

Led by White Stallion Energy Center LLC and the state of Michigan, the parties argued that a Supreme Court decision earlier this year rendered the standards illegal.

In a 5-4 ruling in June, the high court sent the standards back to the U.S. Court of Appeals for the District of Columbia Circuit, finding that EPA should have considered costs when it found that it was "appropriate and necessary" to regulate hazardous emissions from power plants.

"An agency's rule cannot continue to have the force of law, imposing binding obligations on private citizens, when it has been declared unlawful," the industry parties wrote in a motion filed yesterday.

The Obama administration and its allies from states and green groups, meanwhile, urged the appeals court yesterday to keep the rule in place while allowing EPA to address the problems flagged in the Supreme Court's ruling.

EPA issued the Mercury and Air Toxics Standards, or MATS, in December 2011 to require coal-burning power plants to reduce emissions of mercury, lead, arsenic and other hazardous air pollutants. Coal plants are the country's largest emitters of mercury, and EPA said that MATS would prevent 11,000 premature deaths a year and yield up to $90 billion in health benefits.

Although EPA considered costs later in the regulatory process, the agency relied only on a public health analysis when determining that power plants emissions should be regulated in the first place.

In their brief asking the court to completely scrap MATS, industry and the states argued that the Supreme Court had unequivocally ruled that EPA exceeded its authority under the Clean Air Act when it issued the mercury standards.

EPA, they said, "failed to answer the threshold question Congress directed it to consider before regulating the emission of hazardous air pollutants from power plants: Is such regulation worth it -- that is, are the benefits of regulation worth the costs?"

Nearly 20 states -- Texas, Utah, Oklahoma, South Carolina, North Dakota, Ohio, Nebraska, Missouri, Mississippi, Kentucky, Kansas, Indiana, Idaho, Arkansas, Arizona, Alaska and Alabama -- joined Michigan and White Stallion in the request. Iowa Gov. Terry Branstad (R), Oak Grove Management Company LLC, the Gulf Coast Lignite Coalition and the National Mining Association also joined the motion.

To support their request, states and industry noted that EPA mostly relied on co-benefits -- health benefits not directly attributable to reductions in mercury -- to come up with its estimate that the rule would yield billions of dollars in benefits.

The groups argued that removing those co-benefits resulted in a "gross imbalance" between the benefits of the rule and its expected cost of $9.6 billion a year.

"Despite this gross imbalance of costs and benefits, EPA refused to consider costs when making the initial decision whether to regulate," their motion says. "Instead, the agency found regulation was 'appropriate' because power plants' remaining emissions of hazardous air pollutants pose hazards to public health and the environment and because controls are available to address those hazards."

Tri-State Generation and Transmission Association Inc., a small generation company that operates a coal-fired power plant in Colorado, filed a separate motion yesterday asking the court to throw out the rule. Tri-State also asked the court to suspend requirements for power plants that had asked for a one-year extension from the original compliance deadline of April 2015 in the event that MATS is left in place.

A separate group of industry intervenors in the case that includes geothermal power producer Calpine Corp. and Exelon Corp. instead urged the court to leave the rule in place. EPA, the companies said, had already collected "considerable information" about costs and benefits of the rule.

Eliminating the rule, the firms said, would have "disruptive consequences" for the electric power industry given the "substantial" investments companies have made to comply with the rule.

EPA warns vacatur would be dangerous, disruptive

EPA yesterday asked the appeals court to keep the rule in place while it tweaks its rule on an "expedited basis" to address the Supreme Court's "limited holding."

Keeping the mercury rule in place, the administration argued, would "preserve the important public health and environmental benefits achieved by the rule, and avoid regulatory uncertainty and significant complications for other important EPA programs, without significant disruptive consequences for regulated sources."

Although the Supreme Court found that EPA failed to consider costs when the agency determined that it was "appropriate and necessary" to regulate hazardous air emissions from power plants, EPA argued that the existing record for the rule contains extensive documentation about the costs of compliance. Based on the cost data that's already available, the agency believes there is a "serious possibility" that EPA will reaffirm its finding.

EPA also said it intends to wrap up its consideration of costs as close to April 15, 2016, as possible.

The agency also argued that the health and environmental consequences of gutting the rule would be dire, including "extremely dangerous" threats posed by mercury to children and developing fetuses. Vacating the rule would additionally have "significant disruptive consequences" for regulated industries, the administration said.

EPA's state and environmental backers also pressed the court to keep the rule in place while sending it back to the agency for a quick fix.

"Vacating the rule would be profoundly disruptive, creating and exacerbating significant hazards to public health and the environment and disrupting the administration of other vital air and water pollution control programs," EPA's supporters told the appeals court.

That brief was filed by a coalition including Massachusetts, California, Connecticut, Delaware, Illinois, Iowa, Maine, Maryland, Minnesota, New Hampshire, New Mexico, New York, Oregon, Rhode Island, Vermont, Baltimore, Chicago and the District of Columbia. Among the other groups that submitted the brief were the American Lung Association, Environment America, the Environmental Defense Fund, the Natural Resources Defense Council and the Sierra Club.

Judge delays $338M settlement over Quebec oil train accident

Published: Friday, September 25, 2015

A federal bankruptcy judge delayed a $338 million settlement for victims of an oil train derailment in Quebec amid opposition from Canadian Pacific Railway Ltd.

Canadian Pacific won the delay to reach additional time to decide whether to join the settlement or withdraw its opposition.

Bankruptcy trustee Robert Keach said it should not be difficult to secure approval of the settlement by Oct. 5, when the parties are set to meet next.

The settlement was negotiated over the July 6, 2013, oil train derailment in Lac Mégantic, Quebec, which destroyed more than 40 buildings (*EnergyWire*, July 8, 2013).

The Maine-based railroad filed for bankruptcy after the explosion (AP/*Fuel Fix*, Sept. 25). **-- SP**

CALIFORNIA:

Air board likely to greenlight fuel standard

Published: Friday, September 25, 2015

The California Air Resources Board is expected to restore a program to require a 10 percent cut in carbon emissions on transportation fuels over the objection of the oil industry.

The board is set to vote on the program today after it overcame a legal challenge from fuel makers, who argued it would raise gas prices.

The board contends the program would increase fuel prices by a few cents per gallon, adding an extra $5 to $21 in costs for an average driver in 2017.

The regulation, first proposed by former Gov. Arnold Schwarzenegger (R) under a 2007 executive order,

will give "clear direction to the fuel-producing sector that this is the direction of the state," said John Boesel, president and CEO of CALSTART, a transportation group (Judy Lin, Associated Press, Sept. 25). -- **SP**

EMISSIONS:

Viral videos carry heavy carbon footprint

Published: Friday, September 25, 2015

Internet companies are becoming more and more conscious of their carbon footprint as the massive data centers needed to keep them online continue to grow.

Responsible for about 2 percent of greenhouse gas emissions across the globe, data centers emit almost as much carbon dioxide as the aviation industry.

Google has calculated that each query on its site generates 0.2 gram of carbon dioxide, while watching a 10-minute YouTube video generates 1 gram, and using Gmail for a year would produce 1.2 kilograms per person.

Facebook has said its average user's annual footprint is 269 grams of carbon.

When you consider that billions of people use those services, the carbon emissions add up.

"It's an exponential growth in data," said Sophia Flucker, director at Operational Intelligence, a United Kingdom-based consultancy that advises data centers on their energy use.

Flucker said that though the industry is making strides to become more energy efficient, "any efficiency gains are being eaten up by demand."

"It's very much an upward trajectory," she said.

Because of this, environmental groups advocate that tech companies invest in clean energy.

"Energy efficiency is of course very important," said senior IT analyst at Greenpeace Gary Cook. "It's critical. It's also completely insufficient on its own. If you look at the growth in data center demand and our digital world, energy efficiency will slow the [emissions] curve, but the curve is still going to the moon" (Adam Vaughan, London *Guardian*, Sept. 25). -- **AW**

FEDERAL WORKFORCE:

Morale poll results coming soon with 'positive trends'

Kevin Bogardus, E&E reporter

Published: Friday, September 25, 2015

The Office of Personnel Management will soon release highly anticipated poll results that gauge the federal workforce's morale.

The 2015 Federal Employee Viewpoint Survey measures government workers' job satisfaction and commitment in the workplace. The survey, sent to the staff of all federal agencies, has shown plummeting morale across the government in recent years, but the head of OPM is seeing good news in the forthcoming results.

"I am happy to report that we are seeing some positive trends in the numbers this year, although we still have more work to do," said Beth Cobert, acting director of OPM, in a blog post yesterday.

Cobert noted that participation in the FEVS was up to 50 percent this year compared to 47 percent in 2014. In addition, "employee engagement index scores improved at most agencies," according to the OPM chief.

Cobert noted the survey found improving morale at the Department of Housing and Urban Development.

"This past year, HUD increased its engagement score by 5 percentage points. It also increased its global satisfaction score by 6 percentage points. This impressive growth came about as a result of the agency's commitment to increasing internal engagement," Cobert said on the blog.

The OPM head said more good news was coming, which she would share with the public.

"There are many other agency success stories in this year's FEVS results," she said, "and I look forward to sharing more of them soon on the OPM blog."

Recent history has shown, however, that FEVS results are typically less sunny.

Morale across agencies has suffered over the past several years as federal workers have had to deal with budget cuts, pay freezes and a government shutdown in October 2013. For instance, federal employees' global satisfaction was at 59 percent in 2014, about an 8-point drop from 2010 (*Greenwire*, Oct. 24, 2014).

Greenwire's Chemnick talks climate momentum after papal address

Published: Friday, September 25, 2015

As Pope Francis continues his U.S. tour, will his remarks on climate affect the tone of discussions in Congress and the momentum heading into this year's Paris talks? On today's The Cutting Edge, *Greenwire* reporter Jean Chemnick discusses the power of the pope following his historic address. She also talks about the growing momentum surrounding this year's international climate talks in Paris.

VW scandal: German prosecutors probe Winterkorn as Volkswagen emissions-rigging crisis spreads to 2.1 million Audi cars and Skoda models

Prosecutors in Germany have launched a criminal probe into the former VW boss as the scandal stretches to luxury Audi cars and Skoda models

The VW scandal has now extended to Audi cars and Winterkorn is reportedly under investigation Photo: 2015 Getty Images

By Julia Bradshaw

3:18PM BST 28 Sep 2015

Comments

Prosecutors in Germany have opened a criminal investigation into former Volkswagen chief executive Martin Winterkorn in the wake of the emissions-rigging scandal.

The probe is understood to concentrate on accusations of fraud after it was revealed that VW had fitted 'defeat' devices in millions of its diesel cars worldwide to cheat government emissions tests.

The investigation aims to establish who was responsible, according to the statement from prosecutors in Braunschweig, Germany, and will look at Mr Winterkorn's role in the worst crisis to hit VW in its 78-year history.

Winterkorn quit saying he was "not aware of any wrongdoing on my part"

The prosecutors have also received a number of criminal complaints, including one from Volkswagen itself.

Under the German system, anyone can file a criminal complaint with prosecutors, who then must examine the complaint and decide whether there is enough evidence to open a formal investigation and for charges to be brought.

It is essentially the equivalent of a police investigation in the UK.

Prosecutors say it is too early to determine if and when they may try and interview Mr Winterkorn himself.

"This is a very broad case and in other such investigations it has taken many months, sometimes years," a spokesman said.

Mr Winterkorn stepped down as CEO last week and was replaced by former Porsche boss Matthias Mueller after the emissions-rigging scandal wiped billions of pounds off the value of VW and tarnished its previously solid reputation for reliability and quality.

Mr Winterkorn has denied knowing about the pollution-cheating software, and issued a statement at the time of his resignation saying: "I am doing this in the interests of the company even though I am not aware of any wrongdoing on my part."

Some shareholders and analysts are critical about VW's management re-shuffle.

Dr Hans-Christoph Hirt, a director at fund manager Hermes, slammed VW's choice of 'corporate insiders' to take charge of the company, saying the move "raises some real doubts whether the key shareholders have recognised the need for fundamental reform and a real new beginning".

He said: "Following intensive engagement with Volkswagen on corporate governance issues between 2006 and 2009, we have repeatedly raised concerns about aspects of Volkswagen's corporate governance.

"We plan to attend the Extraordinary General Meeting of Volkswagen on November 9 and on behalf of a group of investors will explain our concerns and suggest changes to the company's corporate governance and culture to other shareholders and the management and supervisory boards."

The news came as Audi announced that the device used in parent company Volkswagen's cars to manipulate emissions tests was also fitted in 2.1 million of its own luxury cars.

Of the 2.1 million automobiles, some 1.42 million diesel-powered Audi vehicles are registered in Western Europe, with 577,000 in Germany.

There are almost 13,000 cars containing the cheat software in the United States, a spokesman for Ingolstadt-based Audi said.

The engine in question was built into 1.6-litre and 2-litre turbo diesel models in the A1, A3, A4, A6, TT, Q3 and Q5 ranges.

The cars involved have engines in the "euro 5" emissions category. Those with the newer "euro

6" engines aren't affected by the emissions scandal.

"We're working at full speed to find a technical solution," said Juergen de Graeve, a spokesman for Audi.

"Once we have that solution, we'll write to customers and we'll upgrade the cars so that they're within emissions regulations."

Skoda, which is also part of the VW family, has said that 1.2 million of its cars worldwide contain the pollution manipulation device, according to reports.

Volkswagen shares have fallen by more than 7pc today.

Meanwhile, it has also emerged that VW has suspended the R&D chiefs of its core VW brand, luxury division Audi and sports-car maker Porsche.

The carmaker's supervisory board last Friday agreed to put a number of employees on leave until the details of affair were cleared up.

VW sparked global outrage last week when it admitted that 11 million of its diesel cars are fitted with special gadgets that activate pollution controls during tests but secretly turn them off when the car is on the road.

The deception has wiped billions off the value of the car giant and is set to land the German auto maker with substantial penalties and recall costs as governments and regulators around the world launch investigations - some of the criminal - into the scandal.

The nations carrying out probes include the UK, South Korea, India, Brazil, Australia, France, Italy, South Africa and Norway - whose economic crime unit has opened an investigation.

The US Justice Department has also launched a criminal probe.

VW's new boss Matthias Mueller

Executives at VW have been accused of masterminding the emissions scandal from the company's headquarters in Wolfsburg.

The chain of command of those involved in the rigging deception stretched all the way back from the US to VW's home patch, it has been claimed, with executives in Germany controlling the key aspects of tests which the firm now admits were manipulated.

'Emissions standards matter and they have to be properly policed and delivered'

David Cameron

Testers at a California site evaluated vehicles and results were sent back to Germany before being passed to the US Environmental Protection Agency.

If any car failed to meet emissions targets, a team of engineers from Volkswagen headquarters or Audi's base in Ingolstadt was flown in.

UK Prime Minister David Cameron has condemned Volkswagen over its rigging of emissions tests.

"If companies are breaking the rules and fiddling their figures, that is unacceptable," Mr Cameron said as he flew to New York for a visit to the United Nations. "Emissions standards matter and they have to be properly policed and delivered."

Any move to restrict sales would be "all a matter for the Transport Department," he said.

German authorities have also demanded the carmaker present a timetable for fixing affected

vehicles.

The regulators have asked VW to come up with a plan by October 7 to show when its cars will meet emissions requirements.

The German government has also insisted that it did not know about the rigged diesel emissions tests at VW before the story broke.

"The transport minister found out about the allegations of manipulation the weekend before last," a spokesman said.

"We had no previous knowledge that this system was being used."

Volkswagen has set aside €6.5bn to cover damages including fixes for the vehicles, potential regulatory fines and lawsuits, but the cost of the fallout is expected to be much larger.

The FBI in Detroit is reportedly handling a US criminal investigation of the German company, while 27 state attorney generals have unleashed a joint investigation into the blighted car maker.

Thse 27 states are reportedly going to send subpoenas to the company - these are essentially writs compelling testimony or evidence to be produced or face a penalty.

Private law firms are also lining up to take on VW, with a class action suit already being filed by a Seattle law firm.

The automobile giant already faces at least 60 lawsuits filed in federal courts in the US by consumers alleging the company committed fraud by cheating on emissions tests, which means their cars might not be as efficient as they believed them to be.

Dutch investor group VEB, which represents shareholders, has issued a liability claim against Volkswagen for the losses incurred by investors in the wake of the emissions fraud.

The group said: “The liability in question concerns the incorrect, incomplete and misleading information provided by Volkswagen…this manipulation kept the Volkswagen share price artificially high.

“In doing so Volkswagen acted unlawfully; not only towards car owners but also its own shareholders.”

Meanwhile, European environmental organisation, Transport & Environment, has said it has found some new models of Mercedes, Volkswagens, BMWs and other new cars consume much more petrol than lab tests claim, according to reports from PA.

The organisation said it had found no proof the cars are equipped with the same sort of "defeat

devices" installed on diesel-powered Volkswagens, but called on European Union governments to broaden their probes into the scandal to cover petrol cars as well.

Both the EU and US have announced plans to crack down on the way car emissions are measured.

Currently, manufacturers test emissions in near-perfect lab settings, using smooth tyres unsuitable for roads, engine lubricants so expensive they're beyond the reach of most consumers and even clip off wing mirrors to achieve required emission results.

US regulators and the European Commission have both said they will introduce rules forcing manufacturers to test car emissions under real world road conditions.

The EU is expected to introduce new legislation in early 2106, although French ministers on Thursday called for this to be brought forward to before the end of the year.

New VW boss Matthias Mueller has pledged to win back the trust of customers.

"My most urgent task is to win back trust for the Volkswagen Group by leaving no stone unturned and with maximum transparency, as well as drawing the right conclusions from the current situation," he said on Friday.

Despite the turmoil at VW, the European Central Bank has not suspended the purchase of assets backed by VW loans, under its quantitative easing programme.

Contrary to reports over the weekend, the latest list of eligible collateral purchased by the ECB still includes securities issued by the carmaker.

How the Volkswagen scandal unfolded

2009

Volkswagen starts installing "defeat devices"

The devices bypass tougher anti-pollution standards introduced in 2008. The tougher rules cap legal nitrogen oxide (NOx) emissions.

2013

Abnormalities found in tests

Researchers from the Internationa Council on Clean Transportation and West Virginia University find abnormalities between the NOx emitted by VW vehicles in lab tests and on the road.

May 2014

EPA investigation begins

The Environmental Protection Agency (EPA) begins an investigation into VW. The back and forth between the two lasts more than a year, as VW argues that third-party tests of its cars were flawed.

September 3, 2015

VW admits tricks

VW admits that it has used sophisticated software to trick regulators. Its software monitors steering, engine use and barometric pressure to determine whether the car is being tested for emissions.

September 18, 2015

VW's deception goes public

The EPA makes VW's deception public, leaving the Germany company facing up to $18bn (£12bn) in fines, as well as potential cases from the Department of Justice, FBI and the European Union.

September 23, 2015

VW CEO resigns

In the wake of the scandal, CEO Martin Winterkorn resigns. Since the EPA came out on the previous Friday, VW shares have lost a third of their value, and the comany's reputation has been tarnished.

September 25. 2015

Matthias Mueller named CEO

The head of sister brand Porsche, Matthias Mueller, is named CEO. VW says that 5m cars were affected, down from an initial estimate of 11m

Subject: Attn: David Bloom - VW fines

Hi David,

I know you're busy so I'll keep this as brief as possible. I was thinking about the fines for VW's diesel emissions violations and wondered if it's possible to structure their fines in a way that will benefit all of us.

I think the penalty should be steep, but not in a traditional monetary fine. I would like to see the EPA raise the emission standards on VW ahead of schedule. Meaning, allow VW to agree to manufacturer a high percent of BEVs (Battery Electric Vehicles) by certain target dates or face unsustainable fines.

By 2018, 30% of VW's overall sales in the USA must achieve 90mpg equivalent. If the 30% goal isn't attained in 2018, VW must pay a $5 billion fine per year.

By 2020, 50% of VW's overall sales in the USA must achieve 120mpg equivalent. If the 50% goal isn't attained in 2020 and beyond, VW must pay a $10 billion fine per year.

Obviously these numbers can/should be adjusted. This gives VW the opportunity to atone for their crimes. It provides people of the USA a large selection of competitive BEVs to select from. It removes any compliance car tactics. It would force VW to invest heavily in BEV manufacturing. Ultimately, VW wouldn't be able to meet the EPA mandates without making amazing and affordable BEVs that people will line up to buy.

I believe there's pent up demand for a 250 to 300 mile range affordable Electric Vehicle. Once VW meets these mandates, they'll sell a lot of cars which would force other auto manufacturers to respond in kind. A win win.

I'm sure your staff can structure this more effectively than I've spit balled on a napkin. Anyway, thank you for your time.

Sincerely,

Ex. 6

Subject: FW: How EPA Facilitates Auto Emission Fraud - Final Response

Thanks to you all for helping to pull together information on the PEER press release issues today. This is the desk statement that we came up with and issued to E and E publishing earlier today.

The PEER press release includes many points about EPA's emissions testing processes that are simply wrong. We provide clarifications here:

•□□□□□□□ First, EPA employs a wide range of tools (not just dynamometer testing) that are all critical to the Agency's overall compliance program. These include:

o On-road testing of in-use vehicles using portable emissions measurement systems (PEMS). (Note that EPA deploys PEMS extensively for oversight of heavy duty truck compliance.)

o Manufacturer and EPA testing of in-use vehicles borrowed from consumers or rental fleets using chassis dynamometers and engine dynamometers

o Audits of other industry emissions testing labs

o Selective enforcement audits where vehicles and engines are chosen at random from an assembly line and tested

o Audits of manufacturer emission credit reports

o Real world coast down audits of light-duty and heavy-duty vehicles to confirm GHG and fuel economy label values.

•□□□□□□□ Second, EPA has provided to PEER as requested the vast majority our in-use testing data for heavy duty oversight testing. The **only** data EPA has held back are those that are claimed as confidential business information by the manufacturers themselves. The data the agency has already turned over to PEER includes all of the NOx emission data from the vehicles.

•□□□□□□□ Finally, EPA continually updates its oversight strategies, and adapts when we learn of ways that manufacturers can game the system. That is part of any oversight effort. To enhance our reach we collaborate with California Air Resources Board and Environment Canada

to vigorously oversee this program.

Subject: FW: How EPA Facilitates Auto Emission Fraud

Here is what we sent Mark D at Bloomberg yesterday on this. **Ex. 5**

On August 25, 2015 EPA turned over to PEER the bulk of the information requested under the FOIA including 60 of 66 second-by-second data elements and 291 of 311 summary file data elements. The remaining data elements have been withheld based on a claim by the manufacturers that the submitted data constitutes Confidential Business Information (CBI). EPA's FOIA regulations require that EPA treat CBI claims by data submitters as valid until a formal CBI determination can be made by EPA. Consistent with those regulatory requirements, PEER was informed that it could request that the Agency make a formal CBI determination for the remaining data elements by responding to the initial denial with a FOIA appeal within 14 days. PEER was also informed that absent an appeal, the Agency would assume that PEER did not wish to challenge the manufacturer's CBI claims. We do not believe that PEER has made such a request of the Agency, but if there is one, EPA's Office of General Counsel will make a formal decision regarding the manufacturers' CBI claim for the remaining data elements consistent with EPA regulations, and any remaining data elements that are determined not to be CBI will be promptly released to PEER.

HOW EPA FACILITATES AUTO EMISSION FRAUD
Agency Doubles Down on Outmoded Dynamometers While Eschewing In-Use Data

Washington, DC — In the wake of Volkswagen's emissions cheating scandal, the U.S. Environmental Protection Agency still clings to the questionable testing methods that enabled the fraud, according to Public Employees for Environmental Responsibility (PEER). At the same time, the agency is not using actual on-the-road "in-use" data it collects from diesel vehicles to monitor emissions or efficiency.

EPA emission and fuel economy testing is conducted by putting the vehicle on a dynamometer – essentially a big treadmill. VW engineers used software to control how the engines performed on the dynamometer while actual in-use emissions were up to 40 times higher. The episode vividly illustrates that dynamometer test results can no longer

be assumed to correlate with in-use emissions.

This was a lesson that EPA supposedly learned almost twenty years ago when it discovered that heavy duty diesel engine manufacturers were using the same type of cheating strategy VW employed. In response, EPA forced the heavy duty engine manufacturers to sign a consent decree in 1998 which, among other things, mandated "in-use testing" of vehicles to show compliance. That decree also clearly stipulated that data from that "in-use testing program" were to be made public. Yet –

- Despite the vow to make these data public, EPA has decided that the years' worth of in-use data it has collected will not be released because they contain "Confidential Business Information";
- EPA has invested another $50 million for a heavy duty chassis dynamometer and test cell that it will roll out at a "Showcase" on October 13th; and
- Individual EPA engineers and the agency itself license patents on the engine technologies that EPA is then supposed to regulate.

"All of the claimed public health and economic benefits of emissions and fuel economy standards are based completely upon an unproven assumption – that dynamometer test reflect actual in-use experience," stated PEER Executive Director Jeff Ruch who is pressing EPA through a Freedom of Information Act request to post the in-use heavy duty diesel data as promised in the consent decree. "Independent analysis of in-use data may reveal an even larger disconnect between lab tests and on-the-road performance."

Ironically, just as the VW episode underlines the fact that chassis dynamometer tests no longer can be trusted, EPA is preparing a new showcase test cell. In so doing, EPA managers brushed aside internal objections that further investment in a chassis dynamometer is unjustified, especially since no regulations require it.

"This scandal shows that dynamometer technology is a dinosaur yet EPA keeps pouring money into it," added Ruch, voicing frustration that past complaints from PEER about conflicts of interest within EPA on automotive technology have not been pursued. "The fact that the VW cheating was revealed by outsiders indicates the clubby and closed manner in which this arm of EPA operates."

Perhaps indicating that an internal reappraisal has begun, on Friday September 25th, EPA issued a terse letter to manufacturers that it "may test or require testing on any vehicle at a designated location [under] conditions that may be reasonably expected to be encountered in normal driving operation…" However, this step is a far cry from requiring manufacturers to monitor in-use fleet performance and report that data to EPA. Moreover, EPA stipulates that any new testing is aimed not at increasing regulatory reliance on on-road performance but is instead limited to "the purposes of investigating a potential defeat device."

Chris,

We have not met yet, I'm new over here at the Energy Institute. I was a Powertrain Program Manager at Ford for many years. The thing I don't understand is how the test pattern recognition software ever got through all of the milestone/gateway reviews internally at VW...unless they bypassed their quality system altogether. It must have been in specs, and test procedures, and other documentation. I can't imagine it was something that only five people knew about.

I'm sure I am the millionth person to ask that question and of course I don't expect a reply, but as a car engineer I am curious what comes out in the wash in the days and months ahead. Kind regards, Susan

OnRoadTestCycleMPG-14Sept2015 (2) epa comments Sept 28.docx

Bo, as requested, here are our final comments on the draft paper. We greatly appreciate the chance to review this draft paper, and that the authors made several changes in response to our previous comments. I believe that the paper reads much better than before, and I hope the authors do too.

We are providing a few final comments in the attached file. The two most important comments are single sentences that we suggest adding to the abstract (page 1) and conclusions (p. 30). In both cases, it is important for the reader to understand that EPA "saw this coming" and changed our labeling and rulemaking benefits methodologies several years ago. Absent this context, many readers will assume that EPA was oblivious to the increasing gap that the paper suggests. This important context is extremely timely given the great amount of media attention on the recent Volkswagen violations. If it is not possible to add these sentences to the abstract and conclusions sections, please let me know as soon as possible.

Thanks again to you and the authors.

Hi Lisa,

The authors of the University of Tennessee/Oak Ridge National Laboratory MPG study have reviewed the EPA staff comments you provided on August 21 (see below) and have prepared responses to those comments as well as a revised report based on the comments (see attached). We appreciate the EPA staff taking the time to review the original report and provide detailed comments, as we believe the review comments have improved the report and will make it more useful to consumers.

I would appreciate receiving any final comments on this revised report by **Monday, September 28**. In the meantime, if you have any questions or comments to discuss, please e-mail or call me.

Thanks again!

Subject: EPA comments on UT MPG paper

Bo,

Thanks for sending us the revised August 5 draft.

Attached is a copy of the June 22 draft that you had sent previously, with about 25 comments from OTAQ, all in comment boxes. We worked from the June 22 draft because most of our review was completed prior to receiving the August 5 draft. Based on a quick look at the August 5 draft, it appears that, with the exception of one important section that was modified somewhat, most of the paper is unchanged, so all or nearly all of our comments should still be relevant to the August 5 draft. Our written comments are consistent with the discussion during the conference call on July 22. Specific questions about any of our comments are best directed to Jeff Alson at 734-214-4296 or alson.jeff@epa.gov, who led our review.

Our biggest concerns are:

1) the suggestion that EPA may have overestimated the benefits of the recent GHG/CAFE rulemakings; this suggestion seems to be based on incorrect assumptions of how the benefits analysis was performed, and

2) many examples where the wording is critical of the label and consumer information programs that ORNL, DOE, and EPA have worked so hard to improve over the last 40 years, in ways that we feel are incorrect or misleading.

Most of our comments specifically address these two areas, though there are also a few that flag factual errors as well.

Our concerns are significant and we would respectfully ask that we be allowed to review a revised draft prior to any plans to publish the paper. I would like to stress that we very much are in favor of program assessment and critical analyses that can be used to improve these important consumer information programs, and hope that this paper can be revised in order to contribute to that goal.

Thank you very much for the opportunity to review the draft paper and to submit comments.

How do Motorists' Own Fuel Economy Estimates Compare with Official Government Ratings?: A Statistical Analysis

David L. Greene

Jun Liu
Janet L. Hopson
The University of Tennessee, Knoxville

Xin Wang
Virginia Department of Transportation

Rick Goeltz
Oak Ridge National Laboratory

September 10, 2015

Abstract

U.S. government fuel economy tests are used for two primary purposes: 1) to monitor automobile manufacturers' compliance with fuel economy and greenhouse gas emissions standards and 2) to inform consumers about the fuel economy of passenger cars and light trucks. This study analyzes a unique database of 75,000 fuel economy estimates self-reported by customers of the U.S. government website www.fueleconomy.gov to evaluate the effectiveness of the government's estimates for these two purposes. The analysis shows great variability in individuals' own fuel economy estimates relative to the official government estimates, but much smaller bias relative to the sample average. For consumers, the primary limitation of government fuel economy estimates is their uncertainty for a given individual rather than bias relative to the average individual. The analysis also examines correlations between individuals' fuel economy estimates and specific technologies, vehicle class, driving style, method used to calculate fuel economy, manufacturer, and state. There is some evidence that the shortfall between test cycle fuel economy estimates (used to measure compliance with regulations) and in-use fuel economy estimates (such as those provided by customers of www.fueleconomy.gov) has been increasing since 2005. An increasing shortfall is directionally consistent with changes made by the Environmental Protection Agency to modify its label calculations beginning in 2008 and its rulemaking benefits methodology in 2010 and 2012. If this trend continues, it could affect the benefits realized by fuel economy and greenhouse gas emissions standards. A scientifically designed survey of in-use fuel economy is needed to insure that an unbiased sample is collected and that fuel economy is rigorously and consistently measured for all vehicles. The potential for information technology to reduce the uncertainty in predicting individuals' on-road fuel economy should be explored.

I. Introduction

The window sticker of every new passenger car or light truck sold in the U.S. bears a label with a prominently displayed government fuel economy rating. The intent is to provide consumers with consistent and reliable information they can use when comparing vehicles. Each label also contains the following caveat: "Actual results will vary for many reasons, including driving conditions and how you drive and maintain your vehicle." Differences between consumers' experiences with fuel economy and label values have been a source of discussion and dissatisfaction with the official government ratings since shortly after they were first introduced in 1975 (McNutt et al., 1978).

The U.S. Environmental Protection Agency (EPA) provides two sets of fuel economy estimates ("test cycle" and "label") for every make, model, engine and transmission configuration of passenger car and light truck sold in the U.S.[1] These estimates are important for two main reasons: (1) to enforce the Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emissions regulations for light-duty vehicles (EPA, 2012) the government needs test cycle estimates that are proportional to real world experience and (2) consumers need accurate fuel economy estimates to make informed choices when buying vehicles.
In statistics, the terms accurate, precise and unbiased have specific, mathematical definitions. Accuracy measures the closeness of agreement between repeated

[1] In fact, most vehicle testing is done by the vehicle manufacturers, who certify to the EPA that the tests have been done in accordance with government procedures. The EPA tests 15-20% of vehicles each year to verify compliance (EPA, 2014a).

VW FOIA, EPA 06/20/2017 2017-FFP_027051

measures of a given quantity and its true value. Precision measures the closeness of agreement between repeated measures of a given quantity and the mean of those measures. Bias measures the difference between the mean of a series of measurements or predictions and the true value of a quantity or the true mean of a population. The situation is somewhat different for government fuel economy estimates. A single number (e.g., a car's fuel economy label number) is proposed as a useful estimate of the actual fuel economies of all motorists using the same vehicle[2]. In this case, there is no "true value" but rather a distribution of values for individual drivers. Assuming that the government fuel economy estimate is intended to correspond to the average fuel economy of all drivers of a given vehicle, bias can be defined as the difference between the official estimate and the mean of the population.[3] Because there are not repeated measurements for an actual or even hypothetical true value of fuel economy, how to define accuracy and precision is less clear.[4] In this paper we will quantitatively describe the deviations of individual motorists' estimates from their vehicle's fuel economy rating as *variance*. At the same time, we recognize that from an individual motorist's perspective, the official rating might be perceived as biased or inaccurate.

The government is well aware of the issue of the variance of individual fuel economy results. Every fuel economy label contains the following caveat:

> "Actual results will vary for many reasons, including driving conditions and how you drive and maintain your vehicle."

It is quite possible for fuel economy ratings to be unbiased (reasonably predict the average fuel economy of all motorists) but poor predictors of the experiences of individuals. For the purposes of testing compliance with fuel economy standards, unbiased fuel economy estimates would be sufficient. If the expected fuel economy improvements are realized on average, the expected benefits in petroleum and greenhouse gas (GHG) reductions will be achieved. In fact, all that is necessary for the expected benefits to be realized is that a given percent increase in miles per gallon (MPG) on the test cycle produce the same percentage increase in on-road fuel economy. On the other hand, for the fuel economy label estimates to be of greatest value to consumers' car purchase decisions, they should accurately predict the fuel economy an individual will experience on the road. This is clearly not achievable with a single-number rating for each vehicle. However, modern information

---

[2] Here, a vehicle means a unique vehicle as defined for regulatory purposes, typically a specific configuration of make, model, model year, engine and transmission.

[3] When fuel economy is measured in miles per gallon, the simple average of the fuel economies of a population of drivers will not equal the sum of all miles driven divided by the sum of all gallons consumed. The harmonic mean of the individual fuel economies, weighted by each vehicle's miles traveled will.

[4] A single estimate for a range of values is absolutely precise because its variance is zero. On the other hand, it is inherently inaccurate; the only question being how inaccurate it is.

VW FOIA, EPA 06/20/2017 2017-FFP_027052

technology might possibly enable relatively accurate prediction of individuals' fuel economy.

The test cycle fuel economy estimates used to determine manufacturers' compliance with regulations are based on laboratory testing of vehicles over two (city and highway) driving cycles as required by statute. These drive cycles have been in use since the Corporate Average Fuel Economy (CAFE) standards were enacted in 1975. The label fuel economy estimates provided on the window stickers of new vehicles and used in advertising and the media are based on five drive cycles, adjusted in an attempt to reflect average U.S. on-road experience. The five cycles include the "city" and "highway" cycles used to determine compliance with fuel economy and greenhouse gas emission standards plus additional cycles that reflect, 1) more aggressive driving behavior, 2) the impact of operating under colder ambient conditions and, 3) the impact of air conditioner use.

This study addresses how well the test cycle and label estimates serve their intended purposes though a statistical analysis of approximately 75,000 individual fuel economy estimates voluntarily submitted to the "My MPG" section of the government website www.fueleconomy.gov. The relationship between individuals' own fuel economy estimates (My MPG) and the EPA label estimates is analyzed to determine whether the adjusted EPA estimates are unbiased and to measure the variability of consumers' experiences relative to the label numbers. The relationship between individuals' My MPG estimates and EPA test cycle estimates is examined to shed light on whether the ratio of test cycle to on-road MPG has been changing with succeeding model years. A continually increasing gap would imply that the government's fuel economy standards might not achieve as much reduction in oil use and GHG emissions as intended.[5] The need to monitor on-road fuel economy was recognized by the Environmental Protection Agency (EPA) and the National Highway Traffic Safety Administration (NHTSA) in their fuel economy and greenhouse gas rule for light-duty vehicles.

> "The agencies recognize the potential for future changes in driver behavior or vehicle technology to change the on-road gap to be either larger or smaller." (Federal Register, 2012, p. 62715)

The agencies assumed that a gap of 20%, which is consistent with fuel economy labeling, would continue through 2025, with minor adjustments for fuel energy content (EPA, 2012, pp. 4-1 to 4-7). This 20% gap is an increase over the nominal 15% gap that had been assumed in previous EPA analyses.

The impacts of fuel efficient technologies such as turbo-charging and transmissions with higher gear counts are estimated to see if they perform better or worse on the

[5] The agencies' rulemaking assumes the gap will remain at 20% through 2025, with some minor adjustments for fuel energy content and air conditioner efficiencies (EPA, 2012, pp. 4-2 to 4-7).

VW FOIA, EPA 06/20/2017 2017-FFP_027053

road in comparison to the test cycles. The analysis also attempts to take into account driving conditions that vary from state to state and other factors that might influence on-road fuel economy.

The scope of this study is limited to light-duty vehicles with conventional gasoline (gasoline), gasoline-electric hybrid (hybrid), and diesel powertrains due to the nature of the data available from www.fueleconomy.gov .

II. Previous Research

When the EPA fuel economy estimates were first introduced in 1975, they were not adjusted for real-world driving conditions. Concern about the ability of the test cycle estimates to measure on-road fuel economy motivated assessments by government, industry and consumer groups. In the first year the CAFE Standards took effect (1978), researchers at the U.S. Department of Energy (DOE) published an analysis of over 5,000 fuel economy records for model year 1974 to 1977 vehicles, obtained from a variety of sources (McNutt et al., 1978). Noting that the test cycle estimates were "fairly representative" of the on-road values for the 1974 model year, the researchers observed a trend of increasing shortfall.

> "However, beginning in the 1975 model year and continuing through 1977 (the limits of existing data) the EPA certification values become an increasingly poorer representation of actual on-road fuel economy."

They estimated that the average shortfall had increased from 4% in model year 1974 to about 20% for model year 1977.

In 1980 and 1981, General Motors (GM) conducted surveys of private owners of 1981 model year vehicles and asked them to record odometer readings and fuel purchases at their next four fill-ups (Schneider et al., 1982). From the 38,466 forms mailed out in the 1981 survey, 4,923 (12.8%) usable responses were received. The EPA test cycle combined fuel economy estimate for the vehicles was 25.5 miles per gallon (MPG) while the respondents' average on-road fuel economy was 22.0 MPG, implying a shortfall of almost 14%. The earlier 1980 survey had produced an estimated shortfall of just over 16%. Front-wheel drive vehicles averaged a 6.4% smaller shortfall than rear-wheel drive vehicles, diesels had a 6.5% smaller shortfall than gasoline vehicles, and manual transmissions had 7.2% higher on-road fuel economy than automatic transmissions.

A study by Ford based on data from employees who leased Ford vehicles found that the shortfall for 1978 model year vehicles averaged 20%, but for 1979 and later model year vehicles, the shortfall was relatively stable at about 14% (McKenna and South, 1982). The Ford study also found that the shortfall for winter driving was 10% greater than for summer driving.

VW FOIA, EPA 06/20/2017 2017-FFP_027054

Analyzing a much larger data base of 56,395 vehicles amassed from a variety of sources, McNutt et al. (1982) found large variations in the fuel economy shortfall by model year but no consistent trend over time. They also found important differences between passenger cars and light trucks, rear-wheel drive and front-wheel drive vehicles, and manual and automatic transmissions. Their data showed a strong tendency for the percent shortfall to increase with increasing fuel economy. Overall, they estimated a shortfall of 21% for model year 1981 vehicles. Having quantified variations in the shortfall by technology, vehicle class, model year and make and model, the study was the first to analyze the implications of uncertainties about on-road fuel economy for car buyers:

> "These impacts include the inability of new car buyers to accurately compare different model vehicles and the difficulty in projecting future fuel demand based on the EPA values."

These studies and other evidence led the U.S. EPA to adjust downward the fuel economy estimates reported to the public on window stickers and in advertising (Hellman and Murrell, 1984). A vehicle's fuel economy estimate on the city test cycle was multiplied by 0.90 and its highway cycle estimate was multiplied by 0.78. The effect on a typical vehicles combined[6] fuel economy estimate was approximately a 15% reduction relative to the test cycle numbers. However, the unadjusted test cycle numbers continued to be used to determine compliance with fuel economy standards, as required by statute, and they still are today.

At least one subsequent analysis of on-road fuel economy suggested that the on-road shortfall might have increased since the 1984 study. Mintz et al. (1993) analyzed data from the Energy Information Administration's (EIA) 1985 Residential Transportation Energy Consumption Surveys (RTECS). RTECS collected gasoline purchase and odometer reading diaries from 3,891 households representing 8,401 vehicles. Comparing the on-road estimates to the unadjusted EPA test cycle MPG values, they found a shortfall of 18.7% for passenger cars and 20.1% for light trucks, somewhat larger than Hellman and Murrell's (1984) 15%.

Despite the adjustments to EPA label estimates, the "shortfall" or "gap" between the EPA label estimates of new car fuel economy and what real people achieve in their day-to-day driving continued to be a topic of interest to the public and the media (e.g., O'Dell, 2012). Some media organizations conduct their own tests on public roads in order to compare "real-world" estimates to the EPA's label estimates. *Consumer Reports*, for example, has made such comparisons for years. In a 2005 study, it concluded that fuel economy for conventional gasoline vehicles averaged 9% worse than label estimates, while hybrids were 18% below the label estimates (ConsumerReports.org, 2013). In 2008, the EPA (2006a) made further downward

[6] The combined fuel economy estimate is a weighted harmonic mean of the city and highway estimates, equal to 1/((0.55/city)+(0.45/highway)). The adjusted formula is 1/((0.55/(0.90*city))+(0.45/(0.78*highway))).

VW FOIA, EPA 06/20/2017 2017-FFP_027055

adjustments to label estimates. Consequently, a 2013 *Consumer Reports* study found conventional gasoline vehicles averaged only 2% below the EPA label estimates while hybrids fell short by 10%.

In developing the new 2008 fuel economy label estimates, the EPA analyzed several sources of on-road fuel economy estimates (EPA, 2013, Ch. 2). One was a sample of 8,180 estimates for 4,092 vehicles from users of the My MPG section of the DOE/EPA website www.fueleconomy.gov. For conventional gasoline vehicles, the My MPG data indicated that the label numbers based on the 1984 adjustment procedures were still reasonable estimates of average on-road fuel economy. For conventional gasoline vehicles the average label to on-road shortfall was only 1.4%. However, the shortfall for hybrid vehicles averaged 8.2%. As discussed below, these results closely match those obtained by Greene et al. (2007) in an analysis of a similar sample of the My MPG data.

The EPA, the Coordinating Research Council (CRC), the Department of Transportation (DOT), and the DOE measured the fuel economy of 120 vehicles, including 30 hybrid vehicles, in the Kansas City region (EPA, 2006, Ch. 2). The vehicles were driven by their owners, and data were collected over a 24-hour period by means of portable emissions measurement systems. A zero-intercept regression line predicting on-road fuel economy as a function of the 1984 EPA fuel economy label estimate indicated that conventional gasoline vehicles would average about 0.6% higher fuel economy on the road than the label values suggested. For hybrids, however, an average shortfall of 11% was observed

The problem of insuring a consistent, proportional relationship between fuel economy measured on laboratory tests relative to what drivers will experience in the real world is not limited to the U.S. Large shortfalls between test cycle and on-road fuel economy have also been observed in Europe and China. Two recent studies by the International Council on Clean Transportation (ICCT) found that the on-road to certification test shortfall for vehicles sold in the European Union (EU) has been increasing rapidly (Mock et al., 2014; Mock et al., 2013).

> "All data sets we examined demonstrate the same over-arching trend: the discrepancy between type-approval and real-world CO_2 emissions is increasing. While in 2001 this gap was just 8 percent, it grew to 18 percent by 2008 and then to 38 percent in 2013." (Mock et al., 2014, p. 43)

The ICCT analyses conclude that the increasing gap is most likely due to increasing use of technologies that perform better on the certification ("type approval") test than in the real world, increasing use of flexibilities in the testing procedures, and external factors not accounted for in the test, such as increased use of air conditioning. On the other hand, increased use of strategies to maximize test results are cited by Dings (2013) as the most important factor. Dings attributes approximately half of the gap to permitted techniques for optimizing performance

VW FOIA, EPA 06/20/2017 2017-FFP_027056

on the EU's test procedures that do not correspond to benefits in actual use. He allocates the remaining 50% equally among factors omitted from the test (e.g., air conditioner use), differences between the test cycle and actual driving behavior and conditions, and unknown factors.

Like the data used in this study, the ICCT data came from self-selected samples or business fleets. Potential sources of bias are acknowledged and briefly discussed in the report. However, the ICCT studies assert that model-year trends in the on-road shortfall should be insensitive to the sample design provided that the design does not change across model years. Because of this, the fact that their sample is self-selected should not affect inferences about the increasing on-road shortfall. The ICCT report also points to the fact that the trends are relatively consistent across different data sources.

Also relying on self-reported data obtained from customers of a fuel economy website, Chinese researchers measured the shortfall between official Chinese government estimates and the reported on-road fuel consumption (Huo et al., 2011). For 2009, they found that on-road fuel consumption (gallons per mile) averaged 15.5% above the test cycle numbers. For the 153 makes and models in their data base, the range of increased on-road fuel consumption was from -8% to +60%.

This study uses the My MPG data of www.fueleconomy.gov to analyze the relationships between both test cycle and label fuel economy and what motorists say they achieve in their real world driving. The My MPG data have been analyzed three times before but with fewer samples and model years than are included in this analysis. Greene et al. (2006) regressed reported My MPG numbers against the EPA label estimates using the first 3,221 estimates supplied by customers of www.fueleconomy.gov. The EPA label estimates were based on the 1984 adjustment method since the study predated the 2008 adjustment method. The study found that the adjusted label estimates were nearly unbiased predictors of the average fuel economy of My MPG customers. On the other hand, the EPA label estimates were highly imprecise predictors of any given customer's MPG estimate. This led to the following conclusion.

> "These results imply that what is needed is not less biased adjustment factors for the EPA estimates but rather more precise methods of predicting the fuel economy individual consumers will achieve in their own driving." (p. 99)

Greene et al. (2006) also recomputed EPA label estimates for those customers who provided estimates of their percentages of city and highway driving. Using customer-specific city and highway MPG weightings reduced the mean standard error (MSE) of their model from 3.42 to 2.89, or by about 15%.

Lin and Greene (2011) analyzed 31,227 My MPG records using linear models and ordinary least squares (OLS) regression with robust error estimation. Their goal

VW FOIA, EPA 06/20/2017 2017-FFP_027057

was to develop models that could more accurately predict a given individual's on-road fuel economy using data that could readily be supplied by the motorist. They found that accuracy rather than bias remained the chief limitation of the EPA label estimates, and that the bias of the 2008 adjustment method, relative to the My MPG numbers, was greater than that of the 1984 method. Their best model, however, was able to reduce the mean squared error (MSE) of prediction by only about one third versus the "naïve" prediction that on-road fuel economy equals EPA label fuel economy.

The ICCT's study of EU experience (Mock et al., 2013) includes a brief analysis of an earlier version of the My MPG data set used in this study. They concluded that the gap between U.S. test estimates and the on-road data was relatively steady at about 20% until model year 2003. After 2003, they found that the gap increased, reaching about 35 percent for model year 2012.

III. Data

Data for this study were obtained from the joint DOE/EPA website www.fueleconomy.gov . Since 2005, the website's My MPG section has offered its customers the opportunity to select their vehicles from its database, enter their own fuel economy estimates, compare their estimates with the official EPA label estimates, and share their estimates with other users of the website. The site accepts fuel economy estimates derived by any method, but it provides guidance on how to measure fuel economy and checks data entered for errors and plausibility (Goeltz et al., 2005). For those who want to create fuel purchase diaries, the site provides templates for entering odometer readings (or miles traveled), fuel quantities purchased, price paid, percentage of city and highway driving, and date for any number of refueling events. Consistency checks are made as data are entered, and potential errors are brought to the customer's attention. Alternatively, customers may supply estimates based on their vehicles' dashboard readout, their own calculations, or by simply guessing.[7] The distribution of vehicle records in the My MPG database by type of estimation method is shown in Table 1.

Table 1. Distribution of My MPG Data by Participant's Method of Calculation

[7] In 4,708 cases, estimates made by different methods were provided for the same vehicle. In the case of such repeated observations, each estimate was treated as a distinct observation, resulting in 77,126 total observations for the 72,211 vehicles.

VW FOIA, EPA 06/20/2017 2017-FFP_027058

Method	Frequency	Percent
Vehicle's Computer Display (dash)	11,804	15.3
Miles & Fuel Purchase Diary (miles)	15,086	19.56
Odometer & Fuel Purchase Diary (odom)	15,854	20.56
Calculated by Own Method (math)	32,645	42.33
Guess	779	1.01
Other & Unknown	958	1.24
Total	77,126	

For estimates to be accepted, the customer must respond affirmatively to a return e-mail sent by the site, as a guard against spurious or repetitive entries. In order for customer-supplied estimates to be shown on fueleconomy.gov, they must pass validity tests. For this study, however, all e-mail validated data were accepted. Outlier detection was based on statistical criteria, as described below.

The My MPG data are susceptible to a variety of errors, including simple recording errors or calculation errors by those doing their own calculations. However, the website provides forms with built-in error checking for those entering odometer readings and fuel purchases at each fill up. MPG estimates based on long trips or summer driving tend to overestimate total annual fuel economy, while measurements taken under unfavorable conditions, such as towing or driving in congested traffic or on snowy winter roads, result in underestimates. The variance of the My MPG estimates around either of the EPA estimates is relatively large. On the other hand, the My MPG data may be the best source of information about motorists' beliefs about their vehicles' fuel economies.

Figure 1 shows My MPG data plotted against the EPA combined unadjusted test cycle fuel economy estimates. The unadjusted test cycle estimates are used to determine vehicle manufacturers' compliance with federal fuel economy and greenhouse gas emission regulations. Four different powertrain technologies are shown in different colors. Unfortunately, there is no information about how often owners of flexible fuel vehicles (FFVs) use E85 versus gasoline. In the figures below FFVs are compared to their fuel economies when using gasoline. In Figure 1 the majority of the data points for every powertrain technology fall below the line on which test cycle = reported on-road MPG, reflecting the well-known bias of the test cycle estimates.

VW FOIA, EPA 06/20/2017 2017-FFP_027059

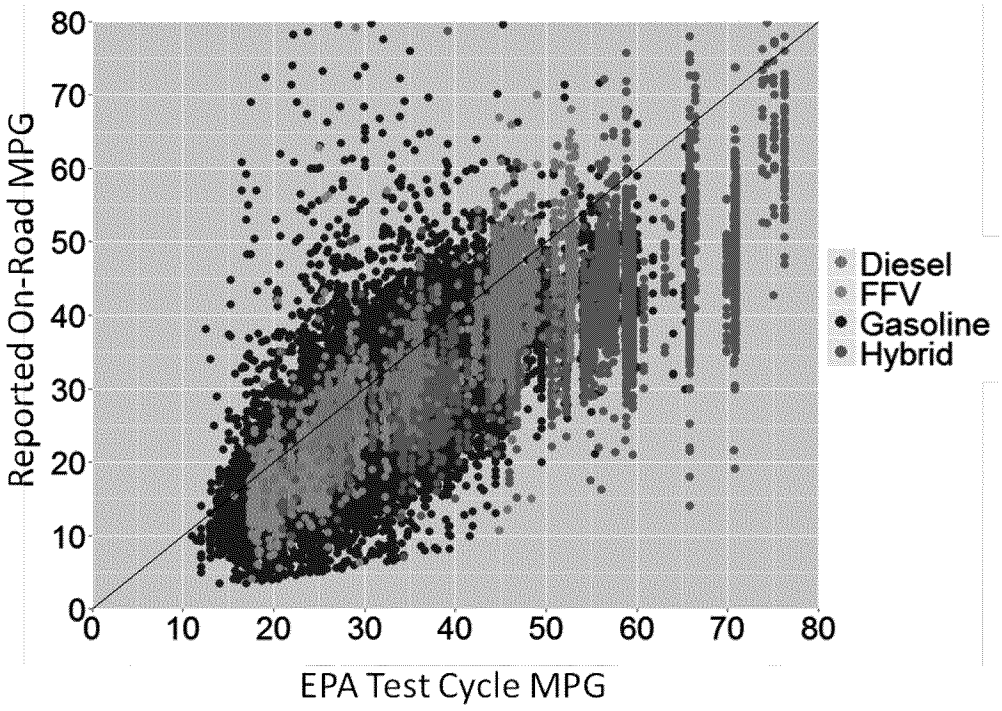

Figure 1. My MPG On-Road Estimates vs. EPA Test Cycle MPG Estimates for All Vehicle Types

Figure 2 shows My MPG data plotted against the current EPA label fuel economy estimate, which has been adjusted to better reflect average on-road fuel economy.[8] The adjusted label estimates are used to inform consumers in advertising and on the government website www.fueleconomy.gov. Bias is less evident in Figure 2, although for gasoline vehicles there appears to be a tendency for the label MPG to overestimate the reported on-road MPG at low MPG values (the majority of observations fall below the line on which both values are equal and hence Label MPG > On-Road MPG) and underestimate MPG at higher MPG values (most observations fall above the line). This tendency does not appear to apply to hybrid vehicles, however. Most estimates exceed the 2008 label MPG: 75% for gasoline vehicles, 93% for diesels and 60% for hybrids.

[8] The 2008 adjustment method has been used for all model years, as implemented by www.fueleconomy.gov.

VW FOIA, EPA 06/20/2017 2017-FFP_027060

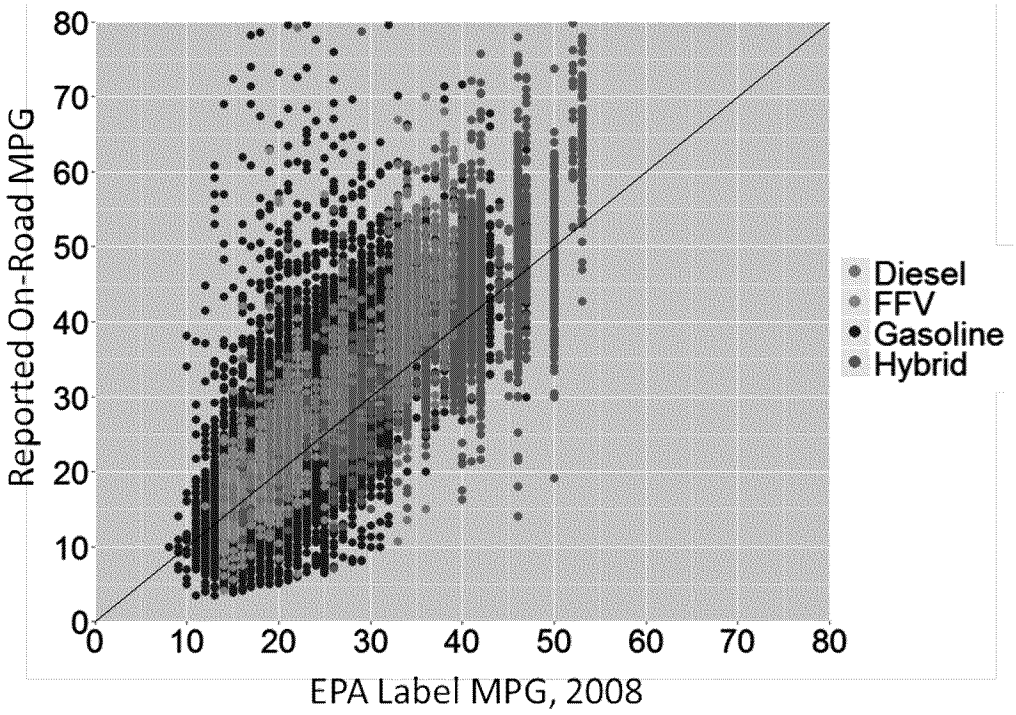

Figure 2. My MPG On-Road Estimates vs. EPA Label MPG Estimates for All Vehicle Types

The My MPG data have strengths and weaknesses. The large number of observations and detailed matches to the owners' vehicles by make, model, engine and transmission make this a unique publicly available source of information. There are observations from every state and for every model year of vehicle from 1984 to 2015. The information supplied by many participants about method of estimation and driving style enables additional inferences. A disadvantage of the My MPG data is that participants are a self-selected sample. While the distribution of the sample can be compared with other known distributions, there remains a potential for bias related to the participants' interest in fuel economy. The methods by which the data are provided by customers of www.fueleconomy.gov have not changed over time so that if there is a bias in the data it is likely to remain consistent over time.

While it is not possible to definitively establish bias or lack thereof, frequency distributions of the respondents give some indication of the representativeness of the sample. The distribution of respondents by type of vehicle is compared with model year sales by vehicle class from 2000 to 2014 (EPA, 2014b) in Table 2. Passenger cars appear to be over-represented in the My MPG sample and all types of light trucks somewhat under-represented.

VW FOIA, EPA 06/20/2017 2017-FFP_027061

Table 2. Distribution of Vehicles by Vehicle Class for 2000-2014 Model Years

New vehicles as a share of production				Shares in My MPG sample	
	Mean	Min	Max		
Car	52.7%	47.7%	60.5%	Car	67.56%
SUV	27.7%	18.9%	35.7%	SUV	17.72%
Pickup	13.4%	10.1%	16.1%	Pickup	10.42%
Minivan/Van	6.2%	3.8%	10.2%	Minivan/Van	4.30%

The My MPG sample also appears to be reasonably geographically representative. A simple correlation of the sample frequencies by state with the 2010 Census state population estimates produced a correlation coefficient of 0.971. The correlation with the Federal Highway Administration's state motor vehicle registration estimates for 2010 was similar, 0.976.[9]

One might suspect that individuals who would monitor their vehicles' fuel economy and submit data to www.fueleconomy.gov would be more likely than the average driver to maximize fuel economy. Although the distribution of driving styles in the general population is not known, the distribution of participants by self-described driving style does not reveal a predominance of eco-drivers. Only 17% of the participants described themselves as more cautious than most drivers and only 2% said they drive to maximize fuel economy (Table 3). Nevertheless, the potential for bias in a self-selected sample remains. As a consequence, the results of this analysis must be interpreted with caution.

Table 3. Distribution of My MPG Participants by Self-Reported Driving Style

Driving Style of Primary Driver	Count	% 1 to 5	% of Total
Drives for maximum gas mileage (1)	602	2.23	0.78
Drives more cautiously than most (2)	4,709	17.43	6.11
Drives with the flow (3)	7,024	25.99	9.11
Drives a little faster than most (4)	9,709	35.93	12.59
Accelerates quickly and passes whenever possible (5)	4,978	18.42	6.45
Not reported	50,104	-	64.96
Total	77,126		

Three measures of fuel economy are used in the analysis below (Table 4). The corresponding distributions (including log-transformed distributions) are shown in Figure 3. The "My MPG" numbers are those reported by individuals throughout the U.S. using www.fueleconomy.gov's My MPG system. MPG numbers adjusted by the EPA for use on vehicle window stickers and for public information are termed "EPA Label" estimates. "EPA Test Cycle" estimates are the unadjusted MPG estimates

[9] Table MV-1, Highway Statistics 2010, accessed on 3/18/2015 at, http://www.fhwa.dot.gov/policyinformation/statistics/2010/mv1.cfm.

VW FOIA, EPA 06/20/2017 2017-FFP_027062

based on the EPA's city and highway cycle dynamometer tests. The test cycle estimates are used to certify manufacturers' compliance with fuel economy standards.

Table 4. Sample* Means of Three Fuel Economy Metrics

Fuel Economy Metric	Sample Mean	Std. Dev.
My MPG User Estimate	26.02	10.02
EPA Test Cycle Estimate	30.56	10.73
EPA Label Estimate	23.08	7.35

*Includes only gasoline, hybrid and diesel powertrains. Outliers deleted if My MPG > 150 or <2, or if more than 5 standard errors above or below regression line of My MPG on EPA Label Estimate. 76,755 observations remained in the sample.

Other variables describe vehicle attributes or represent fixed model year or state effects. The variable "cid" stands for cubic inch displacement but is actually a vehicle's engine size in cubic liters. Zero-one indicator variables include transmission type: "cvt" for continuously variable and "manual" for manual transmission. Transmissions with seven or more gears are designated by the variable "gears7", six or more by "gears6." Other indicator variables represent 4-wheel drive (fourwdr), all-wheel drive (allwdr), and front wheel drive (frontwdr). The categories of driving style are listed in Table 3, with the first five being represented by "style1" to "style5," consecutively. The methods by which participants estimated their fuel economies are represented by the (1,0) variables "dash," "miles," "odom" and "math," as shown in Table 1. The ten largest auto manufacturers are represented by (1,0) variables with the rest combined being the default. Model years 1984 to 2014 and the 50 states plus the District of Columbia are also represented by fixed effects, with 2015 and state not reported used as the default values.

VW FOIA, EPA 06/20/2017 2017-FFP_027063

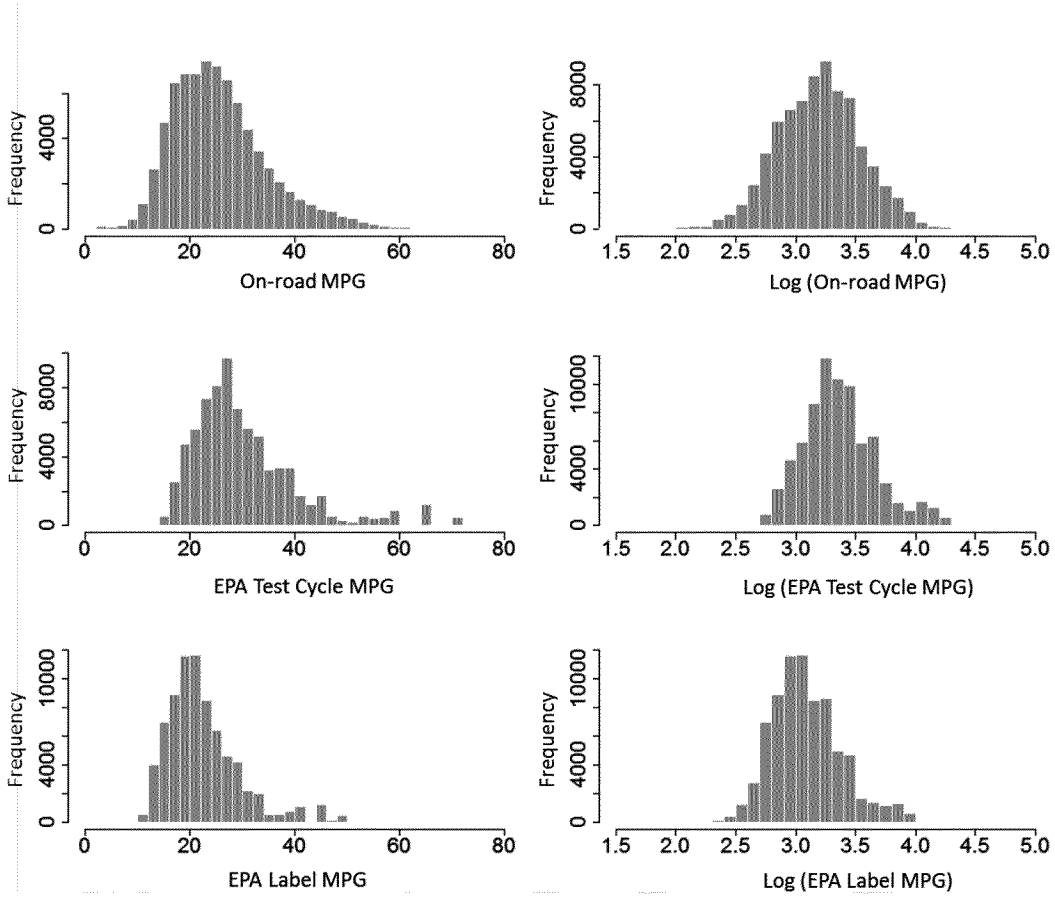

Figure 3 Distribution of My MPG, EPA Test Cycle and EPA Label estimates.

IV. Method

When estimating the relationships between MPG values measured on a dynamometer and those measured on the road, there are three reasons for preferring the log-log functional form. The first is that it treats fuel economy (miles per gallon) and fuel consumption (gallons per mile) symmetrically (log(mpg) = -log(gpm)). Estimated coefficients would have identical values and standard errors but opposite signs. Each coefficient represents the percent change in fuel economy for a 1% change in the respective variable. The second reason is that the effects of many of the factors influencing vehicle fuel consumption are multiplicative rather than additive. For example, the efficiency with which the chemical energy in fuel is converted into mechanical work at a vehicle's wheels is equal to the engine efficiency multiplied by the transmission efficiency, while the energy required to move a vehicle a given distance equals one over the drivetrain efficiency multiplied by the work that must be done to overcome aerodynamic drag, rolling resistance and inertia. The third reason, as will be shown below, is that the residuals from the log-log regression better approximate the more desirable properties of errors in regression models.

VW FOIA, EPA 06/20/2017 2017-FFP_027064

The general estimating equation is therefore,

Equation 1

The coefficient β in the general equation represents the percent change in on-road MPG for a 1% change in test cycle MPG, controlling for the n variables x_{ij}. Alpha (α) is a common constant term, ε_i is a driver/vehicle-specific random error, and i is the index for each vehicle in the My MPG database. When the x_{ij} are (0,1) indicator variables, e^{b_j} is the multiplicative effect of factor j on MPG. For example, if $b_j = -0.05$, then $e^{b_j} = 0.951$, implying that the effect of factor j is to reduce fuel economy by 4.9%.

The unconditional value of β is also of interest as a measure of the average U.S. relationship between on-road and test cycle MPG.

Equation 2

Finally, the linear relationship between on-road MPG and the EPA estimates posted on new vehicles' window stickers and used in advertising is also of interest because it describes the correlation between the information provided to consumers and what consumers experience. Larrick and Soll (2008) found that consumers interpret fuel economy information linearly in terms of miles per gallon rather than in terms of gallons per mile. A linear formulation is therefore used in this regression.

Equation 3

All the regressions in this report were carried out using the STATA® "regress" procedure, with the "robust" correction for heteroskedastic errors.[10] Outliers for

VW FOIA, EPA 06/20/2017 2017-FFP_027065

gasoline and diesel vehicles were identified by first regressing the log of observed MPG on the log of the combined test cycle fuel economy and a constant. The estimated variance of the residuals from the regression was used to detect potential outliers. Upper and lower bounds for outlier detection were increased in integer multiples of the MSE of regression until there was no evident truncation in the graphs of residuals. The mean squared error (MSE) of the regression is relatively large, reflecting the degree of variance evident in Figures 1 and 2. Because the residuals from the regression were skewed towards negative values, the upper boundary was set at +5 standard errors while the lower boundary was set at -6 standard errors from the combined adjusted EPA label MPG estimate. Errors are multiplicative in the logarithmic model, so a lower bound of -6*0.336 allows a fuel economy estimate 87% below the regression line while an upper bound of +5*0.336 sets a limit of 5.4 times the regression line value. These outlier limits rejected only 302 observations (0.45%) from the gasoline vehicle sample. The MSE of the diesel regression is smaller but still large relative to predicted fuel economy. Only 13 hybrid records and five diesel records were deleted as outliers. The outlier detection regression results for gasoline and diesel vehicles are shown in Table 5.

Table 5. Outlier Detection Regressions of My MPG on EPA Test Cycle Combined MPG Estimates

Variable	Estimate	Standard Error	Significance Level	Root MSE	R-squared	No. Obs.
Gasoline Vehicles

Analysis of the residuals from all the regressions reported below using the Stata™ hettest post-estimation tool indicated that they were heteroskedastic (p = 0.000) and skewed towards negative values. Therefore, all regressions reported below were estimated using the Stata™ variance covariance estimation procedure for robust errors.

V. Results

The simple regression model of equation (2) was estimated to determine the average relationship between test cycle and on-road MPG for all model years of

[10] STATA® is a registered trademark of StataCorp LP (2015).

VW FOIA, EPA 06/20/2017 2017-FFP_027066

gasoline, hybrid and diesel vehicles in the sample. Model year indicator variables were then added to the gasoline vehicle regression to explore the possibility of trends in the relationship over time. Next equation (3) was estimated for each of the three types of powertrains to measure the relationship between the information provided to consumers and their own fuel economy estimates. Finally, the more general equation (1) was estimated separately for each powertrain types and then again for only those gasoline vehicles with odometer based estimates.

Test Cycle and On-Road MPG Estimates

Relationships between the logarithms of reported on-road MPG and the EPA test cycle MPG without controlling for other variables were estimated to describe the average "shortfall" for all model years and vehicles implied by the My MPG estimates. Results are summarized in Table 6. Test Cycle MPG is significant at the 0.001 level, although the R^2 values are only 0.56 to 0.68, indicating a large amount of unexplained variance.

Table 6. Log-Log Regression of My MPG Estimates on EPA Test Cycle MPG Estimates (selected variables reported)

Variable	Estimate	Standard Error	Significance Level	Root MSE	R-squared	No. Obs.
Gasoline Vehicles						
Test Cycle MPG	0.9964	0.0034	0.000	0.214	0.56	67,377
Constant	-0.1566	0.0114	0.000

Constant	0.0858	0.0605	0.156			

The coefficient of Test Cycle MPG in the gasoline regression, 0.996, indicates that a 1% increase in fuel economy on the test cycle translated, on average, into almost exactly a 1% increase in fuel economy on the road. The shortfall is determined by both coefficients. For gasoline vehicles, the estimated shortfall from EPA test cycle estimates to My MPG on-road fuel economy estimates is approximately -15%. This is virtually identical to the approximately 15% reduction specified by the EPA's 1984 adjustment procedure (Hellman and Murrell, 1984), but somewhat less than the 19% to 20% shortfalls found by Mintz et al. (1993). It is also less than the approximately 20% average adjustment stipulated by the 2008 rule (EPA, 2006).

VW FOIA, EPA 06/20/2017 2017-FFP_027067

The hybrid results imply a shortfall of about 22% at an EPA test cycle MPG of 25, increasing to 27% at an EPA test cycle MPG of 60. For diesels, the shortfall is only about 7% at an EPA test cycle MPG of 25 and grows to 10% for a vehicle with an EPA test cycle MPG of 50. Both hybrids and diesels have MSE smaller than the gasoline vehicles. Still, even for diesels, a 2*MSE band would be approximately -23% to +30% of the predicted value.

Shortfalls for each drivetrain technology are shown in Figure 4 as a function of EPA test cycle MPG. The estimates are based on the regression results shown in Table 6 and represent the average relationship between test cycle and on-road MPG over the 1984-2015 model years. No model year effects or other variables were included in the regression. The estimated shortfalls for diesel and hybrid vehicles grow with increasing MPG, but the estimated shortfall for gasoline vehicles remains nearly constant at about 15% as MPG increases. Mathematically, this conclusion follows from the fact that the estimated coefficient of the logarithm of gasoline test cycle MPG is approximately 1.0 (0.9964). Early studies, in which carbureted gasoline engines predominated, indicated increasing shortfall with increasing MPG (e.g., McNutt et al., 1982).

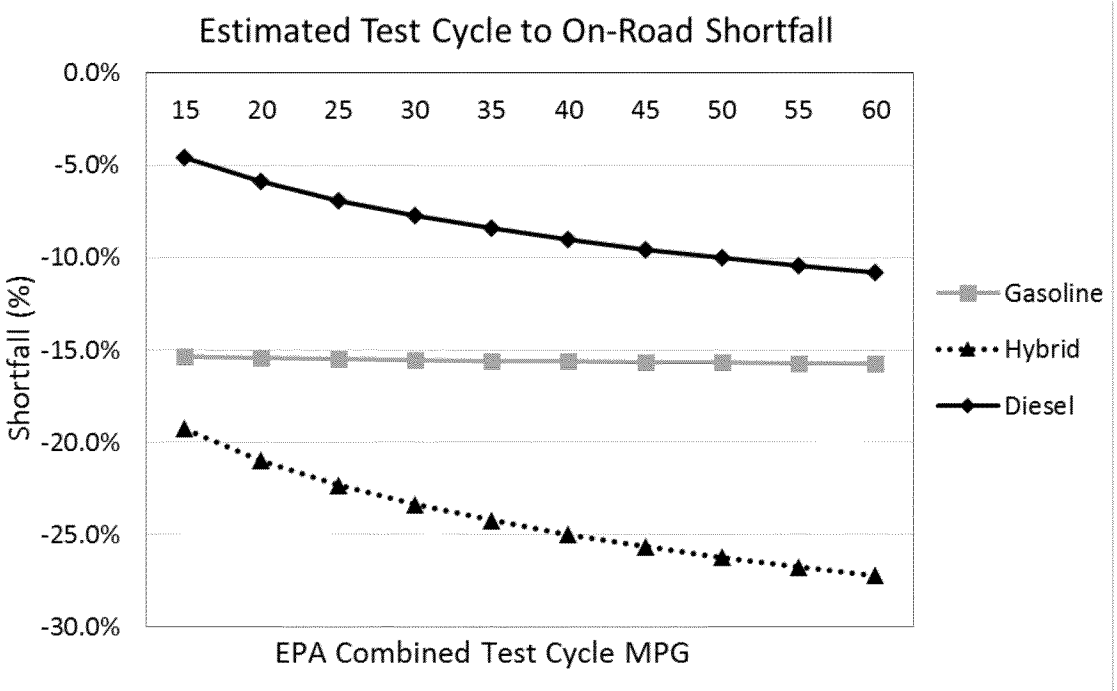

Figure 4. Estimated Shortfall as a Percentage of EPA Test Cycle MPG.

The My MPG data for gasoline vehicles indicates that the shortfall between on-road fuel economy and EPA test cycle estimates may have increased in recent years. A simple model was estimated that regressed the logarithm of My MPG versus the logarithm of EPA test cycle MPG, including model years 1984 to 2014 as indicator (0,1) variables. No other explanatory variables are included. An F-test indicated

VW FOIA, EPA 06/20/2017 2017-FFP_027068

that the addition of the indicator variables was statistically significant at the 0.0001 level. The shortfall, Δ, is estimated as the ratio of the on-road MPG predicted by the model to the average test cycle MPG for light-duty vehicles reported by the EPA (2015, table 9.1) in the respective model year, minus 1. The MPG predicted by the model is the test cycle MPG raised to the power 1.042 (the coefficient of the log of test cycle MPG), multiplied by $e^{C+\delta_y}$, where C is the estimated constant term of the regression and δ_y is the estimated model year coefficient. Because the coefficient of the log of test cycle MPG is greater than 1.0, the shortfall is gradually reduced as MPG increases. The regression coefficients and related statistics can be found in the appendix.

The estimated fuel economy shortfalls for conventional gasoline vehicles by model year are shown as percent differences from the test cycle MPG in Figure 5. Upper and lower bounds based on the 95% confidence intervals of the model year coefficients are also shown. The estimated additional shortfall is very close to 15% from 1987 to at least 2006 and perhaps 2009. In 2010 it dips close to 20%, declines to over 25% in 2013 and then rebounds to about 22% in 2014 and 2015. Although the shortfall appears to have increased abruptly in recent years it may be stabilizing close to the 20% shortfall used by the EPA and NHTSA to estimate future benefits of the fuel economy and GHG emissions standards. As noted above, studies carried out in the 1970s and 1980s estimated that the shortfall increased from 1974 to 1977 and then stabilized in the vicinity of 15% to 20%. The U.S. trend is much less extreme than comparable shortfall estimates for vehicles sold in the EU, described above (Mock et al., 2014).

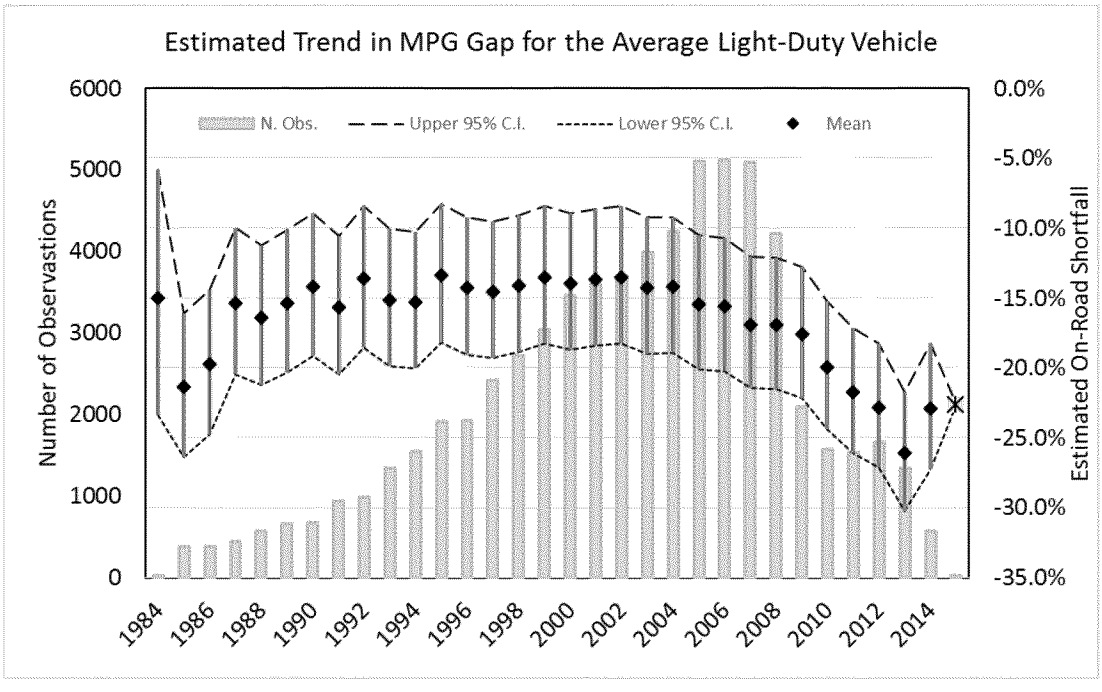

Figure 5. Estimated Fuel Economy Shortfall for Model Years 1984 to 2015.

VW FOIA, EPA 06/20/2017 2017-FFP_027069

Almost forty years ago, an apparent increase in shortfall followed the oil price shocks and gasoline shortages of 1973-74 and the adoption of the first fuel economy regulations in 1975. Similarly, the price of gasoline increased from about $2/gallon in 2004 to $3/gallon in 2008 and, after remaining nearly constant since 1985, the CAFE standards for light trucks were increased in 2005 and those for passenger cars in 2011. The timing of the increase in shortfall suggests the possibility that as standards are tightened (or gasoline prices increase) manufacturers increasingly design vehicles to perform well on the test cycle (and achieve higher label MPG), in the process increasing the gap between test cycle and on-road fuel economy. Blending of ethanol with gasoline approximately tripled between 2005 and 2011, at which point most gasoline contained approximately 10% ethanol by volume (EIA, 2015). Because ethanol has only 2/3 of the energy content of gasoline, this could increase the on-road shortfall by about 2%. The fuel economy estimates of recent model year vehicles would be based on fuel with approximately 10% ethanol while those of older model years would be more likely to be based on fuel with a lower ethanol content. Whether increasing gasoline prices or increasing fuel economy standards or ethanol use, or something else, caused the on-road gap to increase is an important topic for further investigation. Even more important is whether the gap will remain stable in the future, so that an increase in test cycle fuel economy continues to provide an equivalent percentage increase in on-road fuel economy. The apparent trend should be closely watched to insure that the gap does not increase further. Light-duty vehicle fuel economy on the test cycle increased from 24.0 MPG in 2004 to 30.6 in 2014, about 28% (EPA, 2014b). If the shortfall increased by about 7 percentage points over the same period, about one fourth of the test cycle fuel economy gain over that period may have been lost to increased shortfall.

Label and On-Road MPG Estimates

To estimate the potential bias and variance of individual estimates around the label numbers, linear regressions of the My MPG values on only the combined adjusted (2008) EPA label values and a constant were estimated. These regressions describe the correlation between the information provided to consumers and their reported on-road MPG (Table 7).

Table 7. Linear Regressions of My MPG Estimates on EPA Combined Adjusted Label MPG Estimates (selected variables reported)

Variable	Estimate	Standard Error	Significance Level	Root MSE	R-squared	No. Obs.
Gasoline Vehicles						
Label MPG	1.1521	0.0042	0.000	5.097	0.56	67,377
Constant	-0.4568	0.0879	0.000			
Hybrid Vehicles						
Label MPG	1.0757	0.0128	0.000	6.607	0.60	5,031
Constant	-1.5189	0.4888	0.002			

VW FOIA, EPA 06/20/2017 2017-FFP_027070

Diesel Vehicles						
Label MPG	1.2519	0.0188	0.000	5.709	0.60	2,262
Constant	-0.5601	0.5787	0.333			

In the gasoline vehicle regression, the coefficient of EPA label MPG implies that the on-road MPG of My MPG participants averages about 13% better than the EPA label rating at 20 MPG and increasing to 14% better at 50 MPG. The hybrid regression results imply a smaller bias, ranging from +2.5% at 30 MPG to +5% at 60 MPG. Because the constant term is not statistically significant, for practical purposes it would be reasonable for hybrid buyers to assume that average on-road MPG will equal the EPA label MPG. However, that is true only with respect to the national average MPG. An individual's experience is likely to differ greatly from the national average, as indicated by the MSE of more than 6 MPG. Diesels average +22% above the label values at 20 MPG, increasing to 24% at 50 MPG.

The fact that the fuel economy achieved by individuals will differ from the label estimate has long been recognized. Indeed, a statement to that effect is printed on every fuel economy label. The My MPG data indicate that the differences are relatively large. For a conventional gasoline vehicle with a label fuel economy of 25 MPG, the regression results indicate that a confidence bound of +/- 2*(root mean squared error) is +/- 40% of the label value. If a 25 MPG vehicle travels 10,000 miles per year and gasoline costs $2.50/gallon, the consumer can be 95% certain that its fuel costs will be somewhere between $600 and $1,400. Uncertainty of this magnitude can seriously hinder a consumer's ability to make informed choices about fuel economy (Greene, 2011; Greene et al., 2013).[11]

Factors Correlated with On-Road MPG

The following sections describe the results of an expanded regression analysis, including additional variables describing vehicle technologies and driver attributes, as shown in equation 1. As in equation 1, all the expanded models regress the My MPG estimates against the test cycle MPG estimates and other variables. Key results are highlighted in the following sections. Full listings of coefficient estimates and related model statistics for the regressions are provided in an appendix to the report.

Gasoline Internal Combustion Engine Vehicles

This section describes the results of the expanded regression on the subset of vehicles with conventional gasoline engines. Because test cycle fuel economy is one

[11] An important, unanswered question is whether car buyers assume a high degree of correlation among fuel economy estimates for cars they are considering buying. This may depend on whether deviations from label fuel economy ratings are strongly correlated for vehicles owned by the same household. This issue is not analyzed in this report. Further analysis of the odometer and miles data are planned and may shed some light on this question.

VW FOIA, EPA 06/20/2017 2017-FFP_027071

of the explanatory variables, the coefficients of the technology and driver variables do not measure their total impact on fuel economy but instead measure impacts on on-road fuel economy relative to the test cycle. A positive coefficient indicates that a technology increases on-road fuel economy relative to the typical on-road vs. test cycle relationship. A negative coefficient indicates on-road performance that is below average. For example, a technology that increased fuel economy by 5% on the test cycle but only 4% on the road would have a coefficient of about -0.01. The coefficient of -0.01 represents a 1 percentage point increase in the average shortfall, say from 15% to 16%.

When additional variables are included, the coefficient of test cycle fuel economy has a mean value of 0.74, with a 95% confidence interval of 0.72 to 0.76, indicating that a 1% increase in test cycle fuel economy corresponds to a 0.74% increase in on-road fuel economy, all else being equal. Other factors are not equal, however, and they have a substantial influence on on-road fuel economy. Vehicles with larger displacement engines do slightly worse on the road: a doubling of engine size reduces on-road performance by about 2.6% relative to the test cycle.[12] Vehicles with continuously variable transmissions (CVT) appear to get about the same miles per gallon on the road relative to their test values as vehicles with conventional transmissions. Manual transmissions do about 6.9% better than automatics in real world driving. Turbocharged engines are estimated to add about 1.7% to the on-road shortfall in comparison to naturally aspirated engines. The shortfall for turbocharged pickups is about 6% larger, a result that is consistent with a recent study by AAA (2015) also based on the My MPG data. However there were a relatively small number (67) of turbocharged pickup trucks in the dataset. On the other hand, the 542 turbocharged SUVs in the dataset do not show a statistically significant increase in their on-road shortfall, suggesting that the pickup effect may be a result of differences in usage (e.g., towing and hauling). Vehicles with higher gear counts appear to have a somewhat reduced shortfall but this result has a significance level of only 0.094. Four-wheel drive performs about 1.8% worse on the road while front wheel drive does about 1.3% better. With the exception of manual transmissions, none of the technology impacts are greater than 3%, indicating that the test cycle results are not strongly biased relative to on-road performance by these technologies.

Driving style matters. The estimated coefficients are relative to the style of the majority of observations which do not include a description of driving style.[13] If the observations without an indication of driving style have driving styles similar to

[12] All the results reported in this section have a level of statistical significance of 0.05 or better, except where noted otherwise. Detailed results may be found in the appendix.
[13] The option to specify driving style was added in 2007 after the My MPG system had been in effect for several years. Thus, early participants did not have the opportunity to indicate their driving style.

VW FOIA, EPA 06/20/2017 2017-FFP_027072

those that do, the driving style coefficients can be interpreted as differences from the typical driver. Drivers who described themselves as driving "for maximum fuel economy" or "more cautiously than most" reduced their on-road short-fall by about 12% in comparison to those who chose "accelerate quickly and pass whenever possible" and by 8-10% relative to the average driver. The benefit of the more cautious driving styles closely matches other estimates of what an average driver can achieve by "eco-driving" (Greene, 1986; Kurani et al., 2013; IEA, 2005; Kurani et al., 2005).

There are a few statistically significant effects associated with manufacturers, but they combine the unobserved effects of driver behavior and environment with the design and manufacture of the vehicles. In general, manufacturer effects are small. The estimated coefficients range from 2.7% to 5.1% decreases in on-road performance for Ford, Chrysler, Nissan and Hyundai vehicles to zero effects for GM, Honda, Toyota and Volkswagen, to 0.7% to 1.5% increases for BMW and Daimler. Again, it is not possible to attribute these effects to a vehicle's design and manufacture since they include unknown effects of behavior and environment.

Vehicle class effects (measured relative to compact cars) tend to be larger, with light trucks having greater shortfalls than passenger cars. The coefficients of minivans, SUVs, pickups, vans, and special purpose vehicles imply increased shortfalls of 6.4% to 11.5%, in comparison to compact passenger cars. Once again, the estimated effects cannot distinguish effects due to the way the vehicles are used (e.g., towing, hauling or off-road operation) from how they are designed.

In the expanded regression model the only model year effects significant at the 0.5 level are associated with the oldest two model years (1985, 1986) and model year 2013. Nonetheless, an F-test indicated that the model year effects, taken as a whole, are statistically significant at the 0.0001 level. The estimated effects for the oldest vehicles may reflect differences in usage patterns (e.g., shorter trips) and mechanical performance due to the age of the vehicles as much as model year specific effects. In general, the data do not indicate a deterioration of on-road fuel economy performance with age over the typical 15-year lifespan of a light-duty vehicle (Figure 6). Although most year effects are not individually statistically significant, the pattern of the model year coefficients is similar to that in Figure 5 which suggests the possibility of an increasing shortfall in the more recent model years when fuel economy standards have been increasing (Figure 6). Because these coefficients are generally not close to being statistically significant, conclusions cannot be drawn about their meaning. Considered together with the model year effects described above, this result suggests that the apparent increase in shortfall shown in Figure 5 can be statistically explained in part by the additional technology, vehicle class, and other variables included in the expanded regression model.

VW FOIA, EPA 06/20/2017 2017-FFP_027073

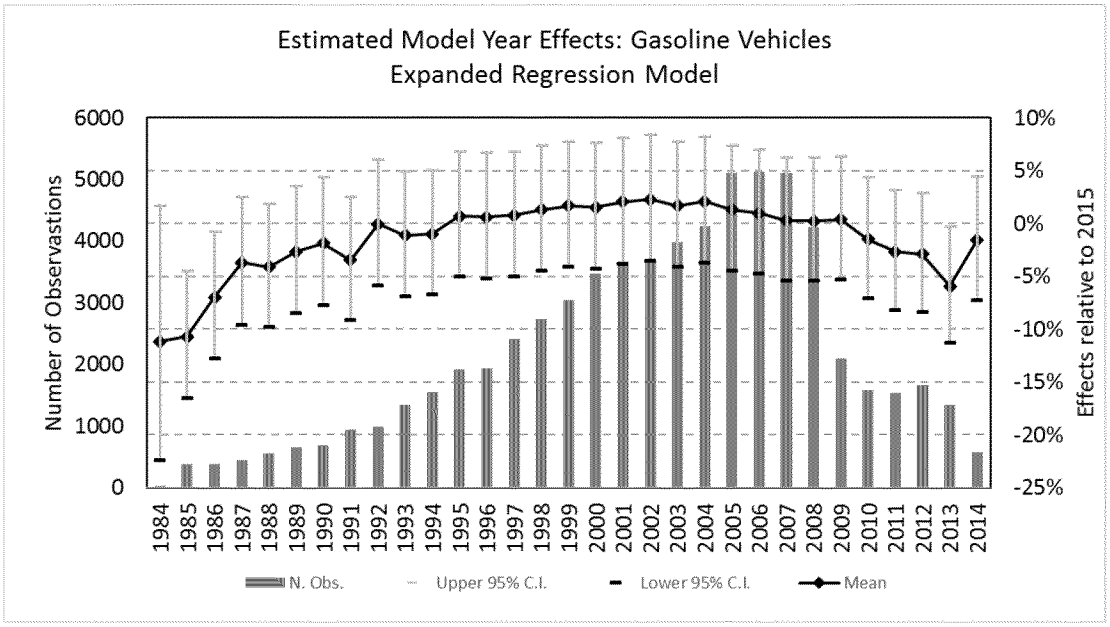

Figure 6. On-road Fuel Economy Performance Compared with Vehicles of 2015 Model Year

All but ten state effects are statistically significant at the 0.05 level. A positive state effect indicates that the shortfall in that state is less than the default shortfall. The default is no state specified, and nearly all states with statistically significant effects have effects that are greater than zero (CA, DC and HI are exceptions). The state effects represent a combination of impacts on fuel economy that vary geographically, including temperature, traffic congestion, speed and trip length. Because some factors reduce the on-road shortfall (e.g., longer trip lengths, mild temperatures) while others increase it (e.g., congested driving conditions, cold weather) it is difficult to discern consistent patterns in the state effects (Figure 7).

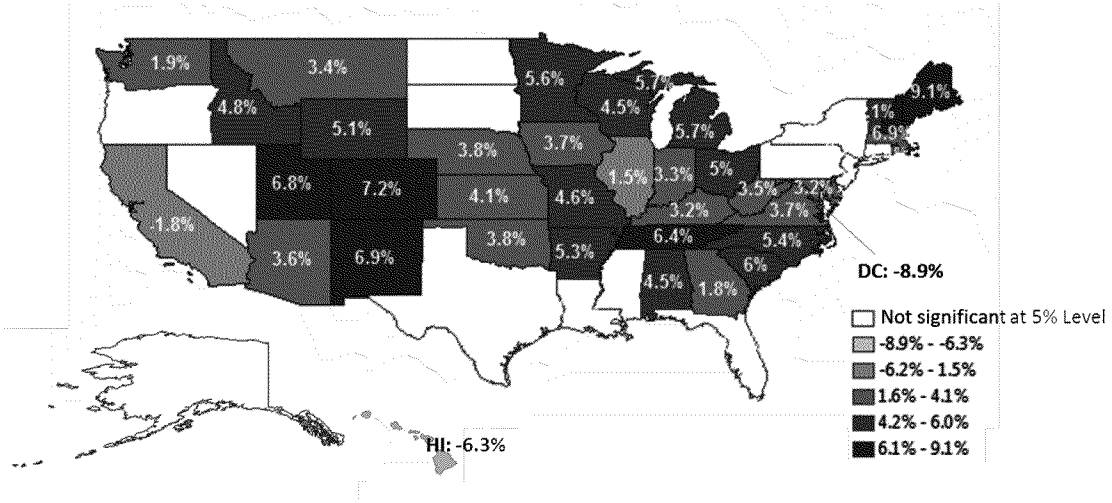

Figure 7. Estimated State Effects: Gasoline Regression Model

The impact of method of estimation is interesting in part because, like the effect of driving style, it is indirectly related to the issue of self-selection bias. Differences among estimation methods could reveal tendencies for those reporting MPG numbers to "self-enhance" in order to appear achieve better than expected fuel economy. Four methods of estimation were represented in the model:

1. Dash: MPG estimate obtained from a vehicle's dashboard display.
2. Miles: MPG estimated by dividing miles between fill-ups by gallons purchased. Participant supplies miles between fill-ups but not odometer readings.
3. Odometer: MPG estimated by fueleconomy.gov by subtracting the odometer reading at the current fill up from the reading at the previous fill up and dividing by gallons purchased at the current fill up. Most records consist of multiple fill ups and MPG is calculated as the sum of miles divided by the sum of gallons.
4. Math: MPG calculated by customer using own, unspecified method.

In the regression the default method is "did not answer", "other" or "guess". About 2.4% of the sample is in this category

Because of the error checking provided by www.fueleconomy.gov during the entry of odometer data, and because of the additional error checking performed for this study, the odometer and miles methods are believed to be the most reliable methods. In theory, the miles-based diary method should produce results similar to the odometer method, since both should be based on the same data: fuel purchases and miles traveled between fuel purchases. This seems to be the case. The estimated effects of the miles and odometer methods are close to each other, relative to the other methods. The "Odometer" method effect is statistically different from zero (at 2.1%), i.e., from the default category, although the "Miles" method effect is not. The effect of using a dashboard estimate is approximately 6.7% higher fuel economy than the default, while the "Math" method produces about 5.6% higher estimates.

VW FOIA, EPA 06/20/2017 2017-FFP_027075

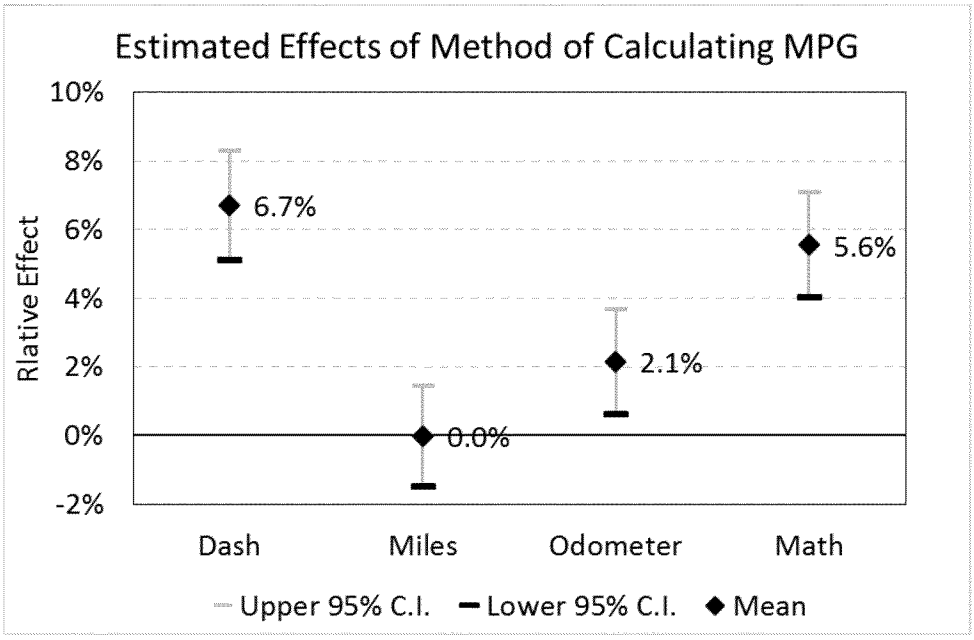

Figure 8. Estimated Effects of Method of Calculating MPG

Even after taking all the above factors into account, the unexplained variance in the My MPG estimates for conventional gasoline vehicles is substantial. A two MSE confidence interval would be +49% to -33% of the predicted value. For a vehicle with a predicted fuel economy of 25 MPG, the two MSE interval would be 17 to 37 MPG.

Following the discussion of results for hybrids and diesels, we report estimates based only on the odometer sample of conventional gasoline vehicles (12,268 records) for comparison with the full sample. A more detailed analysis of the odometer and miles-based data is planned for future study.

Hybrids

The usable sample of hybrid vehicles for the expanded regression is much smaller, 4,807 records, but it includes all years in which hybrids were sold in the U.S. from 1999 to 2015. The coefficient of test cycle MPG is smaller for hybrids than for gasoline vehicles: 0.67 vs. 0.74. The effect of (internal combustion) engine displacement is greater for hybrids: for every 10% increase in displacement fuel economy decreases by an average of 4.6%. The coefficient of CVT, is positive at 2.9%. The effect of a manual transmission is surprisingly large, a 13 percentage point reduction in the test cycle to on-road MPG shortfall; however, the early Honda Insights predominate in this group. Turbocharged hybrids are estimated to have a 20 percentage point greater shortfall but few hybrids are turbocharged. The effect of six or more gears is not significant. Four wheel or all-wheel drive vehicles have a 2.5 percentage point larger shortfall.

VW FOIA, EPA 06/20/2017 2017-FFP_027076

The effect of driving style is similar to that for gasoline vehicles. This may be surprising since many believe that hybrid vehicles are more sensitive to driving style than conventional gasoline vehicles. Like the drivers of conventional gasoline vehicles, those who drive "more cautiously than most" or "for maximum fuel economy" get 10% to 12% better fuel economy than those who "accelerate quickly and pass whenever possible".

Relative to compacts (the default vehicle class), two-seater (mostly Honda Insights) do about 11% better on the road. SUVs are estimated to have about 9.7% larger shortfalls and large cars 7.4% larger shortfalls. Most manufacturer effects are not statistically significant. Most of the model year and state fixed effects are not statistically significant, in part reflecting the smaller sample size.

With respect to the methods of estimating MPG for hybrids, none of the method effects are statistically significantly different from zero.

Diesel

The diesel sample for the expanded regression is even smaller than the hybrid sample, totaling 2,116 usable records. As a consequence there are many fewer statistically significant variables. The coefficient of test cycle MPG is only 0.62, indicating that on-road fuel economy increases more slowly with test cycle fuel economy than for gasoline vehicles, other things being equal. Vehicles with manual transmissions have a smaller shortfall by 5.4 percentage points, but none of the other technology coefficient estimates are statistically significant. The effect of driving style on diesel fuel economy is smaller than that for gasoline vehicles with the most efficient two styles getting 6% to 7% better on-road fuel economy than the most inefficient. For diesels, the effect of the odometer method is also not significantly different from the miles method. Those basing their estimates on dashboard readouts report about 10% higher fuel economy relative to their test cycle numbers than those using the odometer method. Among vehicle classes, pickups and vans are estimated to have significantly greater shortfalls: -17% and -38%, respectively. Again, usage patterns are likely an important reason for the increased shortfall. Only one manufacturer effect is significant at the 0.05 level. None of the model year effects was statistically significant at the 0.01 level.

Odometer Sample for Gasoline Vehicles

The expanded model was re-estimated on the subsample of gasoline vehicles using the odometer record (12,268 usable records). The coefficient of test cycle MPG was slightly smaller 0.68 vs. 0.74. The estimated coefficients of most other technology variables were similar, although fewer were statistically significant. Four of the five driving style coefficient estimates were significant (relative to no answer). Again, the self-described fuel economy maximizing and more cautious groups did about 9% to 10% better than the most aggressive drivers. Most vehicle class effects were

VW FOIA, EPA 06/20/2017 2017-FFP_027077

significant and, again, passenger cars had somewhat smaller shortfalls than light trucks.

The odometer data show a trend of increasing shortfall in model years that is very similar to the full gasoline vehicle sample (Figure 9). Like the full gasoline sample estimates, the effects are relative to 2015. In general, the individual model year effects are not statistically significant but the combination of all model year effects is statistically significant at the 0.003 level. Individually, only the effect for 1998 appears to be statistically significant. When compared with the statistically significant model year effects illustrated in Figure 5, this result and that for the full gasoline sample indicate that the variables included in the expanded regression model explain much of the increase in on-road shortfall since 2004 or 2005.

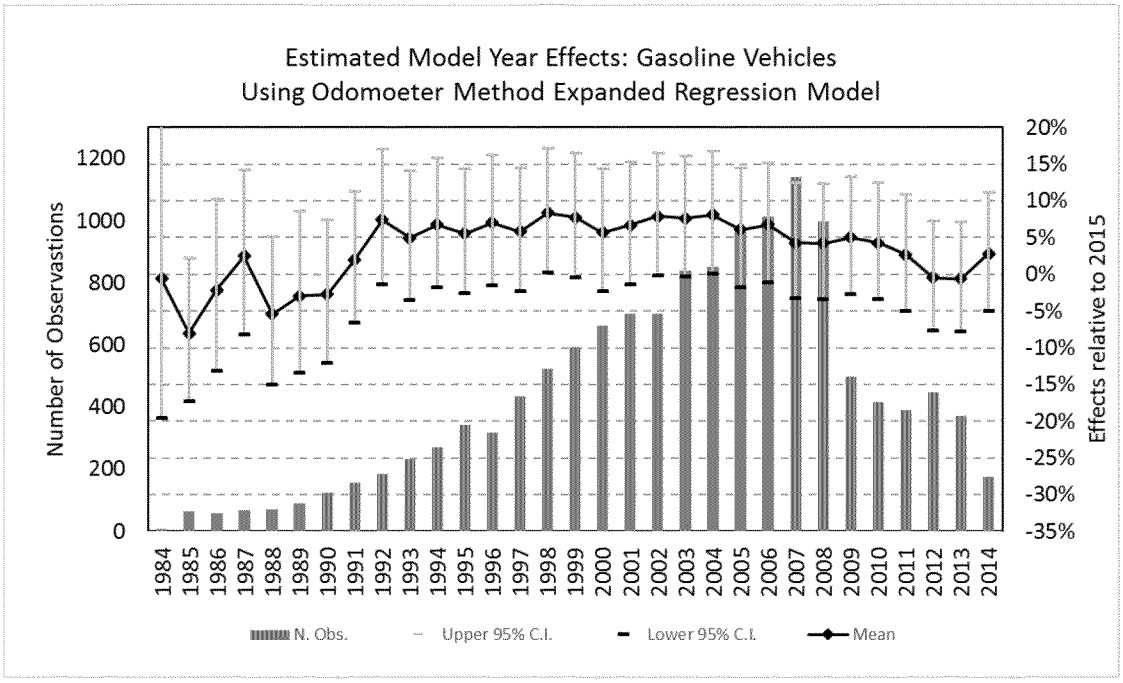

Figure 9. Estimated Fuel Economy Shortfall, Odometer Records: 1984-2014.

VI. Conclusions

Perhaps the most important conclusion that can be confidently drawn from the My MPG data is that the variance of the fuel economy estimates reported by individuals is very large relative to the EPA MPG estimates for their vehicles. This conclusion is almost certainly valid whether the My MPG dataset is biased by self-selection or whether some individuals' estimates are inflated by self-enhancing behavior. A very large fraction of the variation in individual estimates could not be accounted for by the vehicle and driver variables included in our full regression models. As Greene et al. (2007) and Lin and Greene (2011) observed, it appears that the EPA MPG estimates are not strongly biased in comparison to the average fuel economy of all drivers, but that the estimates of individual drivers vary widely around the label

VW FOIA, EPA 06/20/2017 2017-FFP_027078

estimates. This is to be expected given the variations in driving behavior, traffic conditions and other factors. Nonetheless, it reduces the value of fuel economy information in car buying decisions and could an important explanation for why car buyers appear to undervalue fuel economy in car buying decisions (Sallee, 2013; Greene et al., 2013).

Modern information technology may offer a way to develop individualized fuel economy estimates. The information available from a modern vehicle's computer control system could be combined with existing information technology to generate individualized driving cycles. Driving cycles for individual motorists could be used with vehicle simulation models, calibrated to individual vehicles, to develop personal fuel economy estimates for both new and used vehicles. While it is not clear how much estimation errors could be reduced, we believe this is an important area for future research that has the potential to enhance the value of fuel economy information to consumers.

The simple gasoline, hybrid, and diesel regression models indicate that, on average, a 1% increase in test cycle fuel economy has translated into very nearly a 1% improvement in on-road MPG. This is important because it indicates that relative improvements on the test cycle have produced equal relative improvements in on-road MPG. However, simple regressions including fixed effects for recent model years suggest that the test cycle vs. on-road gap has been growing in those years in which fuel economy standards have been increasing. Taken at face value, these results suggest that roughly one-fourth of the gain on the test cycle may have been lost to an increased gap. The impact of these results on rulemaking benefits is less clear given that EPA raised its assumed gap from 15% to 20% for the GHG/CAFE rules. There would be no loss in rulemaking benefits unless the gap were consistently larger than the assumed 20% value. On the other hand, model year effects estimated using the expanded model, whether based on the full gasoline vehicle sample or just those using the odometer method, do not show such a large increase in the shortfall. This suggests that the technology, vehicle class and other variables included in the expanded model explain most of the increased shortfall. Given the limitations of the sample design, the evidence for an increasing gap in the U.S. is not definitive and will have to be resolved by future research.

Driving style affects real-world fuel economy. Those who describe themselves as driving cautiously or attempting to maximize their fuel economy get about 10% more miles per gallon than average or aggressive drivers.

Turbo-charged engines appear to achieve slightly lower fuel economy in the real world than would be predicted based on their test cycle numbers. The same applies to 4-wheel drive vehicles and those with larger engines. The increases in the shortfall are small, however. In general, the on-road shortfalls for light trucks are greater than those for passenger cars. How much of this is due to how the vehicles are driven versus design and technological factors is not known.

VW FOIA, EPA 06/20/2017 2017-FFP_027079

Although the data analyzed in this report are based on a self-selected sample, there are reasons to believe that the inferences drawn from it may be reliable. First, the distribution of vehicle types in the sample is generally similar to that of the vehicle fleet as a whole. Second, the vast majority of drivers do not describe themselves as driving to maximize fuel economy or even as driving more cautiously than most. Third, the statistical inferences based only on the data from drivers using the most rigorous odometer method are not generally different from those using other methods. Fourth, the estimates of the MPG shortfall, technology effects and driving style effects are generally consistent with the existing literature.

Nevertheless, the importance of fuel economy numbers for the enforcement of CAFE and GHG emissions standards and for informing car buyers' decisions, together with the unresolved issues raised by this analysis, point to the need for further research. The authors plan to carry out a more detailed analysis of the odometer data to investigate how fuel economy varies over time, how errors relate to the length of the odometer diary record, and possible correlations among vehicles owned by the same household. Unfortunately, even this more detailed analysis will be limited by the sample design.

Ultimately, a new scientifically designed survey of in-use fuel economy is needed to insure that an unbiased sample is collected and that fuel economy is rigorously and consistently measured for all vehicles. In 2011 Transport Canada launched a Canadian Vehicle Use Study to measure the on-road fuel economy of Canadian vehicles by means of automated data loggers connected to each vehicle's computer system (Transport Canada, 2015). With lessons learned from the Canadian experience, the U.S. may be able to develop efficient and scientifically rigorous methods for measuring the relationship between test cycle fuel economy and consumers' experience in real world driving.

Subject: Notice of Violation Letter

Ms. Kaul,

I called you earlier today and left you a voice message.

I see you were listed as the POC in the Notice of Violation Letter issued to Volkswagen on the defeat devices installed in their 2009 through 2015 diesel light duty vehicles.

Have you had any conversations with CBP regarding this issue? I know you must be very busy, but if you have a few minutes, I would like to talk to you about this.

Best Regards – Jerry

Subject: EPA comment on Bernstein report from today that says $7.4 bln would be worst case for VW fines

Hi Julia and Julia,

Wondering if EPA has any comment on this Bernstein report that says the maximum EPA penalty VW would have to pay would be only $7.4 billion.

This is because the law says it would apply to only the first 10 cars?

Thanks, Tim

Executive summary

Emissions testing in the laboratory forms an essential part of the European type approval procedure for light-duty vehicles. The approach yields reproducible and comparable emissions data and provides clear design criteria for vehicles that have to comply with applicable emission limits. Although emission limits have become increasingly stringent in the past decade, road transport remains the most important source of urban air pollution in Europe with respect to NO_X (nitrogen oxides) and CO (carbon monoxide). Several studies have indicated that in particular on-road NO_X emissions of light-duty diesel vehicles might substantially exceed emission levels as identified during emissions testing in the laboratory. Still, a comprehensive analysis of on-road emissions of light-duty diesel and gasoline vehicles is unavailable to date.

This report addresses the existing knowledge gaps by using Portable Emission Measurement Systems (PEMS) to analyze the on-road emissions of 12 light-duty diesel and gasoline vehicles that comply with Euro 3-5 emission limits and comprise small and midsize passenger cars, two transporters, and a minivan. The selected vehicles where tested on four test routes, representing rural, urban, uphill/downhill, and motorway driving.

The PEMS results indicate that average NO_X emissions of diesel vehicles (0.93 ± 0.39 g/km), including Euro 5 diesel vehicles (0.62 ± 0.19 g/km), substantially exceed respective Euro 3-5 emission limits. The observed deviations range from a factor of 2-4 for average NO_X emissions over entire test routes up to a factor of 14 for average NO_X emissions of individual averaging windows. By comparison, on-road NO_X emissions of gasoline vehicles as well as CO and THC (total hydrocarbon) emissions of both diesel and gasoline vehicles generally stay within Euro 3-5 emission limits. The share of NO_2 (nitrogen dioxide) in the total NO_X emissions reaches 60% for diesel vehicles but is substantially lower for gasoline vehicles (0-30%). The tested light-duty diesel and gasoline vehicles emit during on-road testing on average 189 ± 51 g CO_2/km (grams carbon dioxide per kilometre) and 162 ± 29 g CO_2/km, respectively, thereby exceeding the CO_2 emissions as specified during laboratory testing by on average 21 ± 9%. The magnitude of on-road emissions varies depending on vehicle type, operation mode, route characteristics, and ambient conditions. Cold-start emissions of both diesel and gasoline vehicles span over a wide value range; NO_X emissions exceed Euro 3-5 emission limits by a factor 2-14, CO emissions often exceed emission limits, and THC emissions are both below and above Euro 3-5 emission limits.

The PEMS equipment is reliable and provides accurate emission measurements. PEMS are able to verify the proper operation of emission control technologies under a wide variety of normal operating conditions and suitable for testing emissions of novel fuel/engine/after-treatment/powertrain technologies (e.g., parallel/serial (plug-in) hybrid vehicles. PEMS analyses, including the presented results, may also be useful for updating current transport emission models and inventories. The PEMS procedure for light-duty vehicles is, however, relatively new and requires further refinement before being applied at large scale. Future PEMS applications may particularly focus on polluting driving modes such as cold start at very low temperatures and driving at very high speed as it occurs on the German Autobahn.

The findings of this report indicate that the current laboratory emissions testing fails to capture the wide range of potential on-road emissions. A promising remedy for this problem may be attained by supplementing laboratory emissions testing with complementary test procedures such as PEMS on-road emissions testing. This report provides a first step into that direction, thereby contributing to a more comprehensive EU policy that assures compliance of light-duty vehicles with emission limits under normal conditions of use.

1 Introduction

Emissions testing in the laboratory forms an essential part of the type approval procedure for light-duty vehicles within the European Union. Emissions testing follows a predefined procedure that consists of a specified driving cycle as well as prescribed test conditions at which vehicles are tested on a chassis dynamometer (EC, 2007a,2008). This approach yields verifiable and comparable data on emissions and fuel consumption and provides clear design criteria for light-duty vehicles, which have to comply with currently applicable emission limits.

Although emission limits have become increasingly stringent in the past decade, road transport remains the most important source of NO_X (nitrogen oxides) and CO (carbon monoxide) emissions by 2008, contributing 41% and 34%, respectively to the total emissions of these pollutants within the European Union (EEA, 2010). In particular, urban air pollution continues to persist at high levels, with 16% and 26% of EU's urban population being exposed to higher NO_2 (nitrogen dioxide) and PM_{10} (particulate matter of 10 micrometers or less) concentrations than specified by applicable air quality standards (EEA, 2009). Persisting air quality problems have triggered several policy responses that are targeted at emissions of light-duty vehicles:

(i) The introduction of more stringent emission limits for light-duty vehicles with Euro 5b in 2011 and Euro 6 in 2014 (EC, 2007a,2008).

(ii) The replacement of the currently applied New European Driving Cycle (NEDC) by a world-wide harmonized driving cycle in 2014 (EC, 2009a).

(iii) Potentially, the implementation of supplementary measures for verifying vehicles' emissions outside of the emissions testing with a single standardized driving cycle in 2014.

Particular concerns arise because emissions testing with the NEDC under laboratory conditions might not represent the actual on-road emissions of light-duty vehicles with sufficient accuracy. Several studies have indicated that specifically on-road NO_X emissions of light-duty diesel vehicles might substantially exceed Euro 2-4 emission limits (Pelkmans and Debal, 2006; Hausberger and Blassnegger, 2006; Vojtisek-Lom, 2009). Yet, comprehensive analysis of on-road emissions of light-duty diesel and gasoline vehicles that comply with Euro 3-5 is still unavailable.

This report addresses the existing knowledge gaps by using Portable Emission Measurement Systems (PEMS) to analyze the on-road emissions of 12 light-duty diesel and gasoline vehicles. The selected vehicles include small and midsize passenger cars as well as transporters and a minivan. The analysis contributes further to a knowledge base on real-world driving patterns within the European Union.

The results might assist the design of a road map for developing a suitable on-road emissions test procedure that could supplement the world-wide harmonized driving cycle in the European type approval of Euro 6 vehicles by 2014 (EC, 2007a). The report thereby contributes to a comprehensive EU environmental and industrial policy that assures compliance of light-duty vehicles with emission limits under normal conditions of use.

VW FOIA, EPA 06/20/2017 2017-FFP_027127

This report continues by presenting principal background information on the European emissions legislation as well as on laboratory emissions testing and PEMS (Section 2). Afterwards, Section 3 presents the research methodology and Section 4 provides the results of the PEMS analyses. The report finishes with a discussion (Section 5) and conclusions (Section 6).

VW FOIA, EPA 06/20/2017 2017-FFP_027128

2 Background

This section sets the stage for the later analyses by presenting information on (i) the status of emission legislation within the European Union with respect to light-duty vehicles, (ii) the official procedure to test emissions of light-duty vehicles, and (iii) the current developments in the on-road emissions testing with PEMS.

2.1 The current status of European light-duty vehicle emissions legislation

Emissions testing as part of the type approval procedure for light-duty vehicles is regulated within the European Union by the Co-decision regulation No. 715/2007 of 20 June 2007 (EC, 2007a) and the Comitology regulation No. 692/2008 of 18 July 2008 (EC, 2008). These regulations refer to vehicles of:

(i) categories M1 and M2 - passenger vehicles comprising no more than eight seats in addition to the driver's seat and having a maximum mass not exceeding 5 tonnes

(ii) categories N1 and N2 - vehicles used for the carriage of goods and having a maximum mass not exceeding 12 tonnes

Vehicles of these categories currently have to comply, with the exception of a few vehicle types used for special purposes, with Euro 5 emission limits of the following pollutants (Table 1):

(i) total hydro carbons (THC)

(ii) non-methane hydro carbons (NMHC)

(iii) nitrogen oxides (NO_X)

(iv) carbon monoxide (CO)

(v) particulate matter (PM) in the case of diesel engines and gasoline direct injection engines

The European emission legislation includes additional provisions, such as requirements for low temperature emission tests at -7°C for gasoline vehicles, which have to comply with limits of 15 g/km for CO and 1.8 g/km for HC, measured over the urban part of the NEDC (EC, 2001). Carbon dioxide emissions are currently unrestricted at the level of individual vehicles. The European Commission, however, defines a target for the fleet-average CO_2 emissions of new passenger cars of 130 g CO_2/km for a reverence car mass of 1372 kg (EC, 2009a).

VW FOIA, EPA 06/20/2017 2017-FFP_027129

Table 1: Currently applicable Euro 5 emission limits for light-duty vehicles of category M1 (EC, 2007a)

Pollutant	Emission limits for vehicles with spark ignition engines in mg/km	Emission limits for vehicles with compression ignition engines in mg/km
THC	100	-
NMHC	68	-
NO_X	60	180
$HC+NO_X$	-	230
CO	1000	500
PM	5.0/4.5[1]	5.0/4.5[1]

- not regulated

[1] The emission limit of 5.0 mg/km refers to Euro 5a, which is relevant for category M1 vehicles since September 2009. The emission limit of 4.5 mg/km refers to Euro 5b, which will be relevant for category M1 vehicles from January 2011 onwards.

In view of the introduction of more stringent Euro 6 emission limits in 2014, Regulation 715/2007 (EC, 2007a) contains provisions that should assure compliance of vehicles with applicable emission limits during both type approval and on-road driving under normal conditions of use[1]:

(i) Recital (15) requests the Commission to investigate the use of PEMS and so-called *not-to-exceed* regulatory concepts in the context of the revision of the NEDC.

(ii) Article 4(2) requires that manufacturer ensure an effective limitation of emissions pursuant to this Regulation, throughout the normal life of the vehicles under normal conditions of use.

(iii) Article 5(2) in conjunction with the definition in Article 3(10) prohibits the use of defeat devices under conditions that are likely to occur during normal vehicle operation, if these conditions are not substantially included in the test procedures for verifying emissions[2].

(iv) Article 14(3) requires the European Commission to keep reviewing procedures, tests, and requirements used to measure emissions. If reviews identify that provisions are no longer adequate or, in particular, do not reflect on-road emissions from real-world driving, the provisions should be adapted accordingly through the Comitology procedure.

The compliance of light-duty vehicles with applicable emission limits is verified by emissions testing on the chassis dynamometer in the laboratory. The next section describes in greater detail the key characteristics of the driving cycle, i.e., the NEDC that is currently used for standard laboratory emission tests within the European Union.

[1] Normal conditions of use might also include particularly polluting driving pattern such as driving at very high speeds, as it is frequently observed on the German autobahn, engine cold start at very low temperatures, or idling in congested traffic that may cause a cool down of after-treatment devices.

[2] Defeat devices are elements of design that sensor certain ambient and vehicle parameters for the purpose of influencing the operation of any part of the emission control systems, resulting in a reduced effectiveness of emission control technologies.

VW FOIA, EPA 06/20/2017 2017-FFP_027130

2.2 The test procedure for light-duty vehicle emissions within the EU

Emissions testing as part of the type-approval process for light-duty vehicles has to balance two criteria:

(i) quantifying as far as possible vehicle emissions under real-world driving conditions
(ii) assuring reproducibility and comparability of emission measurements

The testing of emissions and fuel consumption of light-duty vehicles takes place in the laboratory on chassis dynamometers. The details of the test procedure are described by Directive 98/69/EC (EC, 1998) and its further amendments.

Before the emissions test, vehicles have to soak for at least 6 hours at a test temperature of 20-30°C. Emissions are then measured while vehicles follow the speed profile of the New European Driving Cycle (NEDC). The entire NEDC consists of four repeated ECE-15 driving cycles of 195s duration each and one extra-urban driving cycle (EUDC) of 400s duration (Figure 1).

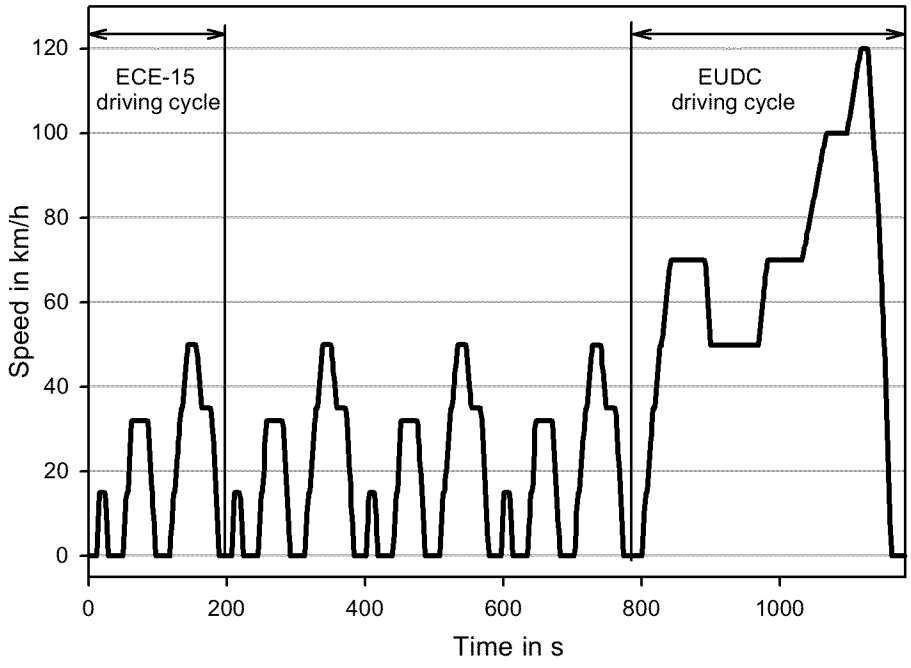

Figure 1: Speed profile of the New European Driving Cycle (NEDC)

The four ECE-15 cycles represent urban driving conditions that are characterized by low vehicle speed, low engine load, and low exhaust gas temperature. By contrast, the EUDC in the second part of the NEDC accounts for extra-urban and high speed driving modes up to a maximum speed of 120 km/h. The entire NEDC covers a distance of 11,007 m in a time period of 1180 s and at an average speed of 34 km/h. An initial idling period has been eliminated in the NEDC, thus emissions sampling begins with the start of the engine. Emissions are typically sampled with a Constant Volume Sampler (CVS) and expressed as averages over the entire test cycle in grams per kilometre [g/km] for each of the regulated pollutants (see Table 1).

The main characteristics of the NEDC in comparison to other certification cycles, i.e., the US FTP-75 driving cycle and the Japanese JTC cycle as well as the ARTEMIS urban driving cycle are provided in Table 2. The NEDC was developed to assure comparability and reproducibility of vehicle emissions that have been tested at standard conditions. Such an approach to emissions testing

VW FOIA, EPA 06/20/2017 2017-FFP_027131

comes inevitable with limitations regarding the ability to reproduce actual on-road emissions. Criticism of the NEDC refers in particular to its smooth acceleration profile (André and Pronello, 1997) that requires only a very narrow range of possible engine operation points (Kageson, 1998).

Table 2: Comparison the key characteristics of selected driving cycles

	NEDC	ECE-15	US FTP-75	JTC 10-15 mode
Region	EU	EU	USA	Japan
Trip duration [s]	1180	780	1874	660
Trip distance [km]	11.007	4.052	17.77	4.16
Average speed [km/h]	33.6	18.7	34.1	22.7
Maximum speed [km/h]	120	50	91	70
Share [%]				
- Idling	24	30	19	32
- low speed >0≤50 km/h	55	70	60	49
- medium speed >50-90 km/h	14	0	19	19
- high speed >90 km/h	7	0	2	0

Table 2 (continued): Comparison the key characteristics of selected driving cycles

	ARTEMIS urban	ARTEMIS rural	ARTEMIS motorway[1]
Region	EU	EU	EU
Trip duration [s]	920	1081	1067
Trip distance [km]	4.47	17.27	28.74 (29.55)
Average speed [km/h]	17.5	57.5	97.0 (99.7)
Maximum speed [km/h]	58	112	132 (150)
Share [%]			
- Idling	29	3	2 (2)
- low speed >0≤50 km/h	69	31	15 (15)
- medium speed >50-90 km/h	2	59	13 (13)
- high speed >90 km/h	0	7	70 (70)

[1] Values in parentheses indicate the 150 km/h specification of the ARTEMIS motorway driving cycle.

The NEDC only insufficiently represents on-road driving pattern that are characterized by low speed and high torque operation, steep and dynamic transient velocities, and driving at very high-speed. It is hence likely that vehicles comply with applicable emission limits during NEDC testing although they might show substantially higher pollutant emission levels alongside with elevated fuel consumption and CO_2 emissions on the road (André, 1996; Hausberger and Blassnegger, 2006; Pelkmans and Debal, 2006; Tzirakis et al., 2006). These limitations have been acknowledged by the European Commission and triggered the current research activities around the implementation of Euro 6 by 2014, including the development of (i) a more representative and internationally harmonized driving cycle as well as (ii) a supplemental off-cycle emissions test procedure for assessing the on-road emissions of light-duty vehicles for type approval (EC, 2009c).

VW FOIA, EPA 06/20/2017 2017-FFP_027132

2.3 Current developments in on-road emissions testing with PEMS

On-road emissions testing with PEMS has been so far mainly developed to evaluate the in-service conformity of EURO V and EURO VI engines of heavy-duty vehicles (EUR, 2006a,b,c; Bonnel and Kubelt, 2010). Emissions testing of heavy-duty vehicles as part of the type approval procedure is specified by Regulation (EC) No. 595/2009 of the European Parliament and of the Council (EC, 2009b). This regulation defines rules for the in-service conformity of vehicles and the durability of emission control devices. In particular, EC (2009b) suggests (i) considering the application of portable emission measurement systems (PEMS) for verifying the in-service conformity of heavy-duty vehicles and (ii) introducing supplemental procedures to control on-road (so-called *off-cycle*) emissions.

Verifying the in-service conformity of heavy-duty vehicles typically requires to remove the engine from the vehicle and to test its emissions in dedicated engine test cells. Such an approach is, however, very impractical and expensive. Therefore, it has been proposed to develop a protocol for in-service conformity checking of heavy-duty vehicles based on PEMS. The European Commission (DG ENTR in co-operation with DG JRC) launched in January 2004 a co-operative research programme to study PEMS applications for heavy-duty vehicles within the European Union. The experimental activities started in August 2004 and resulted in a successful application of PEMS to heavy-duty vehicles (Bonnel and Kubelt, 2010). Following the success of the EU-PEMS project, the European Commission announced the intention to launch a manufacturer-run pilot programme at the 97th Motor Vehicle Emissions Group (MVEG) Meeting on 1 December 2005. The main purpose of the programme was to evaluate the PEMS-based technical and administrative procedures for a larger range of technologies and in statistically more significant numbers. The PEMS pilot programme was started in autumn 2006; the outcome of the programme is expected to provide further insight on the potentials to introduce in-service conformity provisions based on PEMS in the European type-approval legislation for heavy-duty vehicles.

Based on their successful application to heavy-duty vehicles, PEMS might potentially also be applicable to light-duty vehicles as supplemental measure to ensure that vehicle emissions are appropriately controlled outside standardized laboratory conditions (EC, 2007a. The JRC initiated a first PEMS test campaign to obtain insights into the suitability of PEMS for emissions testing of Euro 3-4 light-duty vehicles in 2007 based on an Administrative Arrangement with DG ENTR (EC, 2007c). The PEMS testing of Euro 5 vehicles in 2009 and 2010 was then commissioned by the recent Administrative Arrangement No. SI2.552273 between the JRC and DG ENTR (EC, 2009c). The aim of this Administrative Arrangement was in particular to obtain on-road emission values for a range of Euro 5 vehicles and thereby supporting the development of suitable off-cycle emission test procedures that might supplement the standard laboratory emission test of Euro 6 vehicles from 2014 onward. The results of both test campaigns are documented in the present report, which continues in the next section by explaining in greater detail the methodology used for the PEMS test campaign of light-duty vehicles.

VW FOIA, EPA 06/20/2017 2017-FFP_027133

3 Methodology

The methodology section contains four parts: the first part provides an overview of test vehicles; the second part presents the routes used for PEMS testing; the third part explains PEMS equipment and test protocol; the fourth part explains data processing and data analysis.

3.1 Test vehicles

The analysis presented in this report includes passenger cars, i.e., vehicles of category M1, for which the currently applicable emission limits are provided in Table 1. The PEMS test fleet consists of 12 light-duty vehicles, comprising 5 gasoline vehicles, 1 gasoline-hybrid vehicle, and 6 diesel vehicles. Nine vehicles represent small and compact passenger cars, one vehicle is a minivan, and two vehicles represent small transporters. All test vehicles belong to category M1 of the European type approval classification (EC, 2007b), are sold on the European market, and passed type approval based on Euro 3-5 emission limits (Table 3). The second phase of the PEMS test campaign in the years 2009 and 2010 focused in particular on Euro 5 vehicles with the aim of complementing the data generated for Euro 3 and Euro 4 vehicles during the first project phase between 2007 and 2008.

3.2 PEMS test routes

The PEMS test campaign started with the testing of Vehicles A and C on local routes, including trips from Ispra to Milan as well as in down-town Milan. Based on the results of these tests, four defined routes were developed (Table 4, Figure 2), which later served as standard test routes for all subsequent PEMS tests of Vehicles B and D-L. The characteristics of these four test routes reflect as far as possible the diversity of normal on-road driving in Europe and include:

(i) Route 1: Ispra-Milan-Ispra; representing a mix of rural and motorway driving
(ii) Route 2: Ispra-Varese-Ispra; representing a mix of rural and urban driving
(iii) Route 3: Ispra-Sacro Monte-Ispra; representing a mix of rural and severe uphill-downhill driving with an elevation difference of around 800 m
(iv) Route 4: Motorway; representing high-speed driving at speeds of up to 130 km/h

Figures 3 and 4 provide an overview of altitude profiles and the typical speed distributions of the four test routes.

VW FOIA, EPA 06/20/2017 2017-FFP_027135

Table 3: Specifications of test vehicles

Vehicle	Vehicle category	Model year	Mileage at test start [km]	Fuel	Engine capacity [ccm]	Maximum engine power [kW]	Mass of CO_2 emitted during standard NEDC testing [g/km] / [cumulative kg]	Emission treatment technology	Applicable emission limit
A	N1 (small transporter)	2007	20,743	diesel	1997	69	182 / 2.00	oxidation catalyst, no DPF	Euro 3, Class II

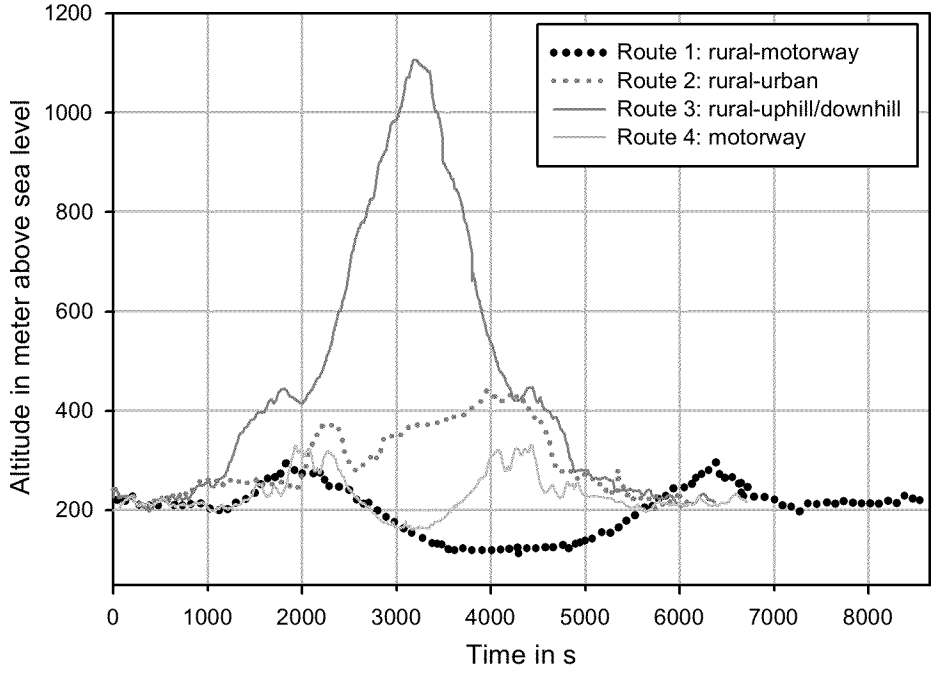

Figure 3: Altitude profiles of PEMS test routes; NEDC testing, by comparison, does not include any altitude changes

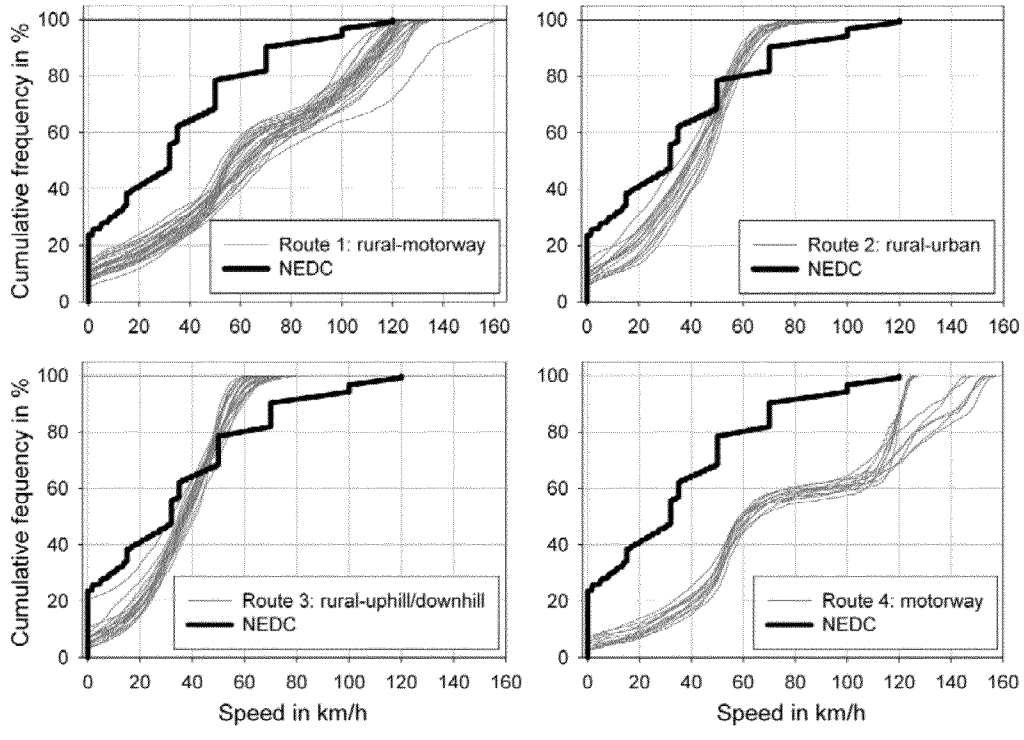

Figure 4: Typical speed distributions of PEMS test routes in comparison to the NEDC

The four test routes represent different on-road driving pattern, which can also be characterized by plotting the relative positive acceleration (RPA) as function of vehicle speed. The RPA is calculated as the integral of the product of instantaneous speed and instantaneous positive acceleration over a defined section of the test route, a so-called sub-trip, such as:

VW FOIA, EPA 06/20/2017 2017-FFP_027138

$$RPA = \frac{\int_0^{t_j} (v_i \times a_i) dt}{x_j}$$ (*Equation 1*)

where: t_j = time
x_j = distance of sub-trip *j*
v_i = speed during each increment *i*
a_i = instantaneous positive acceleration during each increment *i* contained in the sub-trip *j*

A sub-trip is defined here as any part of the test route, in which the vehicle speed is at least 2 km/h for a period of at least 5 seconds. Individual sup-trips are separated from each other by periods of idling or very slow motion in congested traffic. The length and number of sub-trips contained in a PEMS test depends on the route characteristics and the traffic situation and might show substantial variability both between and within individual test routes. Thus, sub-trips may differ substantially in their length. The maximum achievable RPA is directly related the vehicle power. Additional factors affecting the magnitude and distribution of RPA values such as: (i) the drivers' behaviour and driving style, (ii) climatic and ambient conditions, as well as (iii) traffic and road conditions. The distribution of RPA values allows comparing the characteristics of different routes and may be used as criterion to standardize on-road PEMS emissions testing.

The RPA values of the individual PEMS test routes show distinct pattern that differ from the ones of the NEDC (Figure 5). In particular Routes 1 and 4 include a larger share of high-speed driving than the NEDC. Vehicle testing on the four test routes covers furthermore a substantially larger range of the RPA-speed spectrum than does the conventional NEDC testing. Low RPA values in the range of 0.1-0.4 m/s^2 at velocities of 0-50 km/h represent the majority of driving conditions on our four PEMS test routes. Still extreme conditions exist such as RPA values above 1 m/s^2 at low speeds or relatively low RPA at high speeds in the range of 120-130 km/h occur; these driving conditions are not covered by the NEDC.

Overall, Route 1 with a mix of rural and motorway driving seem to capture best the potentially large variability of on-road driving conditions. Still, driving on identical routes can lead to considerable variability in the RPA-speed trace depending on vehicle type as well as road and traffic conditions. The overview in Figure 5 clearly indicates the shortcomings of the NEDC: it completely excludes driving at low velocities and medium too high acceleration (RPA >0.2 m/s2) as well as at high velocities and low acceleration. The ongoing development of a world-wide harmonized driving cycle addresses parts these shortcomings; the new driving cycle well be implemented in the European Union by 2014 with the introduction of Euro 6 emission limits.

VW FOIA, EPA 06/20/2017 2017-FFP_027139

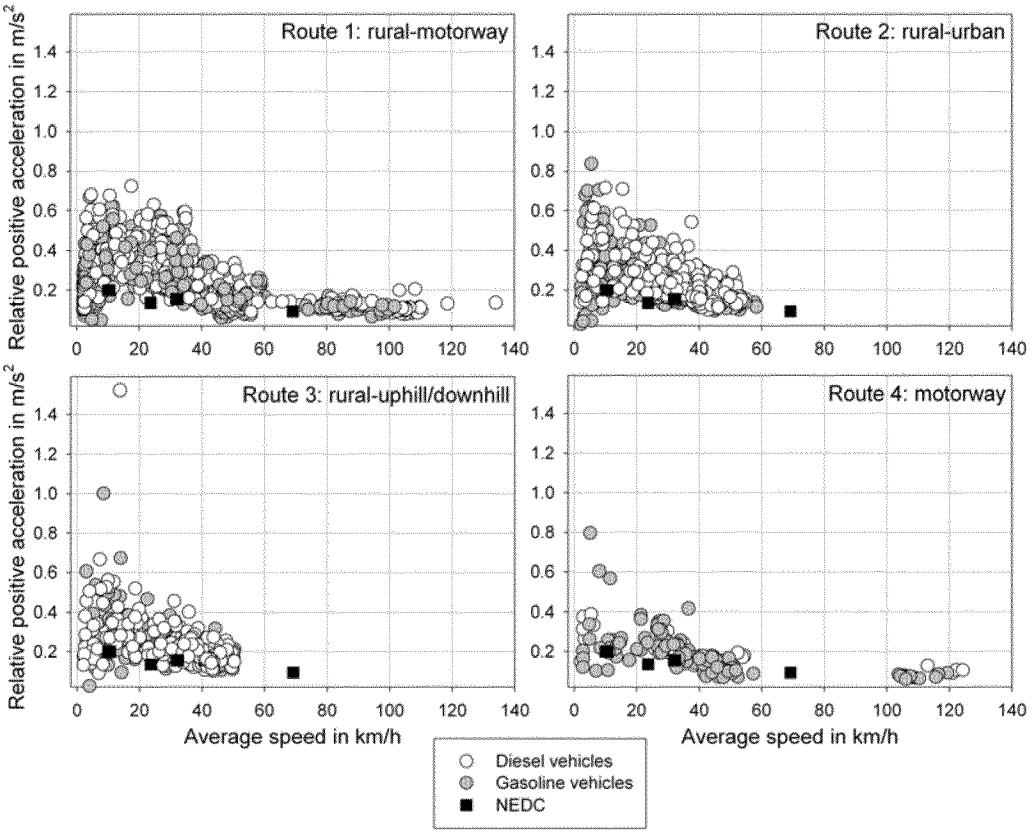

Figure 5: The relative positive acceleration of sub-trips composing the four PEMS test routes and the NEDC

Regardless, also the driving on the four PEMS test routs has one particular limitation: It is not able to reproduce driving at very high speeds (i.e., >140 km/h) as it frequently occurs on the German Autobahn. This limitation is relevant because Germany presents the largest vehicle market in Europe and operates an Autobahn network of more than 12,000 km, which accounts for one third of all vehicle-kilometres driven in Germany. Large parts of the Autobahn are free of a speed limit. In 1995, the average vehicle speed on the Autobahn was 134 km/h (Pander, 2007) and thereby higher than the speed limit enforced in all other European countries[3].

3.3 PEMS equipment and test protocol

For the emissions testing of light-duty vehicles, a Semtech-DS PEMS from Sensors Inc. was used. This equipment is commercially available and consists of a tail-pipe attachment, heated exhaust lines, a Pitot tube for measuring the exhaust mass flow and temperature, exhaust gas analyzers, a data logger to the vehicle network, a GPS, sensors for ambient temperature and humidity, and exhaust pipelines (Figure 6). The mass of the PEMS systems including an external battery for power supply amounts to 80 kg and is thereby equivalent to the mass of a passenger. PEMS accounts at maximum for 9% of the mass of tested vehicles. Although the mass of the PEMS equipment might not substantially affect the test results, it may introduce a bias into the emission measurements. This bias may, however, allow reproducing on-road emissions of with more than one person in the vehicle.

VW FOIA, EPA 06/20/2017 2017-FFP_027140

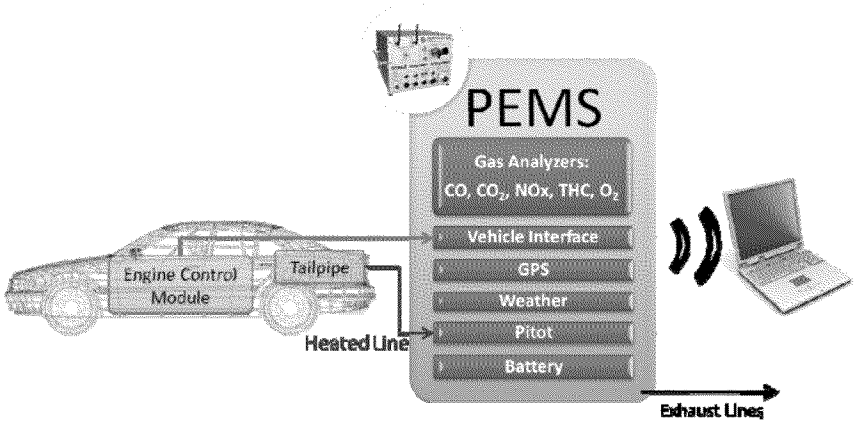

Figure 6: Schematic overview of PEMS and auxiliary components (courtesy Sensors Inc.)

PEMS measures the exhaust gas concentrations of the regulated pollutants THC, CO, and NO_X, as well as of CO_2 and NO emissions, the exhaust mass flow and the exhaust temperature. The complete set of parameters measured with PEMS during on-road emission tests, as well as the corresponding measurement technique, is provided in Table 5. Total hydrocarbon emissions are measured by a heat flame ionization detector (HFID); CO and CO_2 emissions are measured by a non-dispersive infrared (NDIR) analyzer; NO and NO_2 emissions are measured by a non-dispersive ultraviolet (NDUV) analyzer; the total NO_X emissions are then calculated from the NO and NO_2 data. Particulate matter (PM) is excluded from this analysis.

Table 5: Overview of parameters measured with PEMS

Category	Parameter	Measurement technique
Exhaust gas pollutants	THC	HFID
	CO	NDIR analyzer
	CO_2	NDIR analyzer
	NO and NO_2	NDUV analyzer
	Exhaust flow rate	EFM
	Exhaust temperature	EFM temperature sensor
Vehicle characteristics	Vehicle speed	GPS
	Vehicle position and altitude	GPS
	Acceleration	GPS
	Distance travelled	GPS
Ambient conditions	Elevation	GPS
	Ambient humidity	Humidity sensor
	Ambient temperature	Temperature sensor
	Ambient pressure	Pressure sensor

[3] Italy and Poland present exceptions: The speed limit on three-lane (six lanes in two directions) highways in Italy may be 150 km/h if indicated. The speed limit on highways in Poland will be 140 km/h from 2011 onward.

VW FOIA, EPA 06/20/2017 2017-FFP_027141

To measure the exhaust mass flow and exhaust temperature, the Semtech-DS uses an exhaust mass flow meter (EFM) equipped with differential pressure devices and thermocouples. The EFM has an accuracy of at least ± 3.0% at a resolution of 0.003 m^3/min and an exhaust temperature range from ambient to 550 ºC. The random error of PEMS measurements typically accounts for 2-3% of the measured value. The accuracy of PEMS has been verified against laboratory equipment by Rubino et al. (2007a). The verification tests were conducted on a 48 inches chassis dynamometer (MAHA; maximum power 150 kW; maximum velocity 200 km/h; inertia of 454-4500 kg) over the NEDC driving cycle. A Horiba MEXA-7400HTR-LE was used as reference for measuring NO_X, CO, HC, and CO_2 emissions. The NO_X emissions were measured using a chemiluminescence analyser (CLA; the total hydrocarbons emissions were measured by a heated flame ionization detector (HFID), CO and CO_2 were determined by NDIR analyzers. The CVS flow rate was set at 6 m^3/min. The gaseous emissions were measured during the emission tests according to the current European type-approval protocol. Good agreement was found between the emissions as measured with PEMS and the reference test cell analyzers (Horiba) as shown in Figure 7 (see also EPA, 2008; Rubino et al., 2007a,b). The deviations between both PEMS and laboratory equipment are negligible with respect to the findings of this report.

The test protocol of the Semtech-DS PEMS for measuring on-road emissions of light-duty vehicles was adapted in two points from the one developed for heavy-duty vehicles (EUR, 2006c):

(i) The emissions were measured directly from cold start, including cranking.

(ii) The vehicle conditioning (e.g., the vehicle temperature) was monitored before, during, and after the test.

The main components of the Semtech-DS PEMS (i.e., pumps, electronic equipment, and analysers) were installed in the cabin of the vehicle, which avoids contamination, excessive vibrations, and heating of the equipment. The exhaust mass flow meters were attached to the vehicle's tailpipe; GPS and weather station were installed outside of the vehicle (Figure 8). The power for the analytical equipment was supplied by an external battery. This reduces the interference of PEMS with the engine operation and allows PEMS testing for up to 2.5 hours; the battery, nevertheless, introduces additional weight to the PEMS equipment. PEMS has been proven to yield reliable emission measurements in previous test campaigns for heavy-duty and light-duty vehicles (EUR, 2006a,b; Rubino et al., 2007a; Bonnel and Kubelt, 2010).

3.4 Data collection and analysis

3.4.1 Complementary data supply and emission tests

In addition to PEMS testing, the emissions of Vehicles A, D, and G-L were determined based on NEDC testing in the laboratory. All laboratory tests were conducted on a 48 inches (118 cm) chassis dynamometer produced by MAHA. A Horiba MEXA-7400HTR-LE was used as standard laboratory equipment for measuring THC, CO, HC, NO_X, and CO_2 emissions (see also Section 3.3). The vehicles that were tested based on the NEDC generally complied in the laboratory with the applicable emission limits.

For Vehicles B, C, E, and F no such NEDC tests were performed because in the early phase of the PEMS test campaign attention was predominantly paid on the reliability and completeness of PEMS measurements, rather than on establishing on-road emission values of light-duty vehicles in comparison to laboratory tests. The PEMS tests of the various vehicles were complemented as far as possible by vehicle data such as engine fuel rate [g/s], engine speed [rpm], or engine torque [Nm] obtained from the Engine Control Unit (ECU) via a data logger.

VW FOIA, EPA 06/20/2017 2017-FFP_027144

3.4.2 Data analysis

During the actual PEMS testing, each vehicle started from the JRC in Ispra (Italy) and returned to the JRC for technical checks, calibration, and data download. PEMS measures emissions with a time resolution of one second. Recorded emissions data were uploaded together with data from the PEMS's GPS system into EMROAD©, which is an Excel® tool developed by the JRC for analyzing and evaluating PEMS data (Kubelt and Bonnel, 2007). PEMS records uniformly NO_X emissions, which are uncorrected for ambient humidity and intake air temperature. This approach is justified by the aim of this project, i.e., to report on-road emissions as they occur under real-world driving conditions.

EMROAD© calculates first average emissions for the entire test route, expressed as grams per kilometre. EMROAD© also presents emissions in alternative metrics, e.g., as function of time or emitted CO_2 mass. These metrics will, however, not be discussed in detail because emission limits for light-duty vehicles are uniformly defined by EU legislation as distance-specific values in grams per kilometre (EC, 2007a).

To enable a more detailed analysis of emissions, EMROAD© allows calculating emission averages for individual averaging windows that represent sub-trips of a test route. This method is generally referred to as the averaging window method and represents an established methodology that will be used for the official emissions testing and characterization of Euro VI heavy-duty vehicles (EC, 2010). The method reduces fluctuations in the second-by-second emissions data and enables a more detailed understanding of emission variability in comparison to route averages. The principle approach is as follows: Pollutant emissions are averaged over intervals of a predefined duration. These intervals are referred to here as *averaging windows*. The duration of an averaging window is determined in the case of heavy-duty vehicles by a predefined quantity of work the vehicle's engine has performed until a certain point. This reference metrics is chosen because emission limits for heavy-duty vehicles are defined as work-specific quantities. In the case of heavy-duty vehicles both work-based averaging windows and applicable emission limits are therefore directly linked to an actual engine parameter (Kubelt and Bonnel, 2007; Bonnel and Kubelt, 2010; EC, 2010). In the case of light-duty vehicles emission limits are defined as distance-specific values (see Table 1). In line with the definition of emission limits (EC, 2007a), we chose in this report the distance travelled by the vehicle [km] as reference parameter to determine the length of an averaging window[4]. To make reference to the NEDC laboratory testing, the duration of a window is determined precisely as the distance travelled until the vehicle has emitted a cumulative mass of CO_2 that is equivalent to the CO_2 mass emitted during NEDC testing (see Table 3, column 8 from the left; Figures 9 and 10). This approach assures comparability of the distance-specific averaging window emissions with the Euro 3-5 emission limits. It is important to note that the CO_2 mass emitted presents a constant but the distance travelled by the vehicle may vary depending on the actual driving conditions. The averaging windows move at time increments equal to the data sampling period, i.e., one second. The distance *d* travelled during any averaging window is determined by:

$s = s_2 - s_1$, when (*Equation 2*)

$$m_{CO_2}(d_2 - \Delta s) - m_{CO_2}(s_1) < m_{CO_2,ref} \leq m_{CO_2}(s_2) - m_{CO_2}(s_1) \quad \text{(Equation 3)}$$

[4] The duration of averaging windows is generally longer than the one of sub-trips (see Section 3.2). On exception presents motorway driving, which typically is not interrupted by vehicle stops. Under such conditions, sub-trips might be extremely long, thus exceeding the length of an averaging window by several factors.

where: $m_{CO_2,ref}$ = total reference CO_2 mass [kg] determined during the NEDC test

$m_{CO_2}(s_1)$; $m_{CO_2}(s_2)$ = total CO_2 mass [kg] emitted until distance s_1 and s_2

Δs = distance travelled during the time increment of the sampling period of one second (Figure 10)

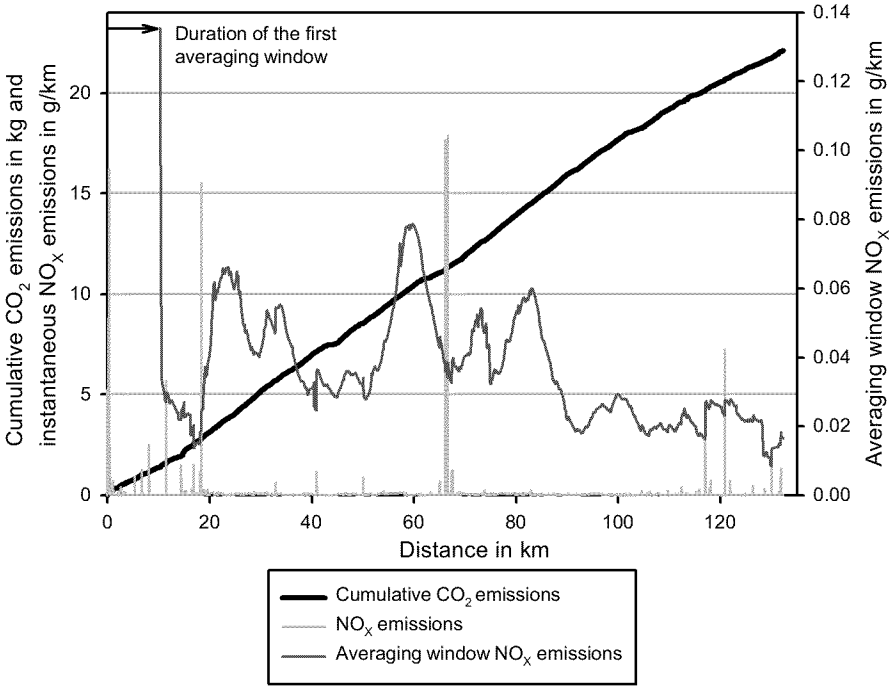

Figure 9: Example of the averaging window method for NO_X emissions; the first average is calculated once the vehicle has travelled a distance at which it has emitted a cumulative mass of CO_2 equivalent to the cumulative CO_2 mass emitted during a standard NEDC test; all consecutive windows move in increments of the sampling period, i.e., one second assuring that the cumulative CO_2 emissions match the reference CO_2 mass

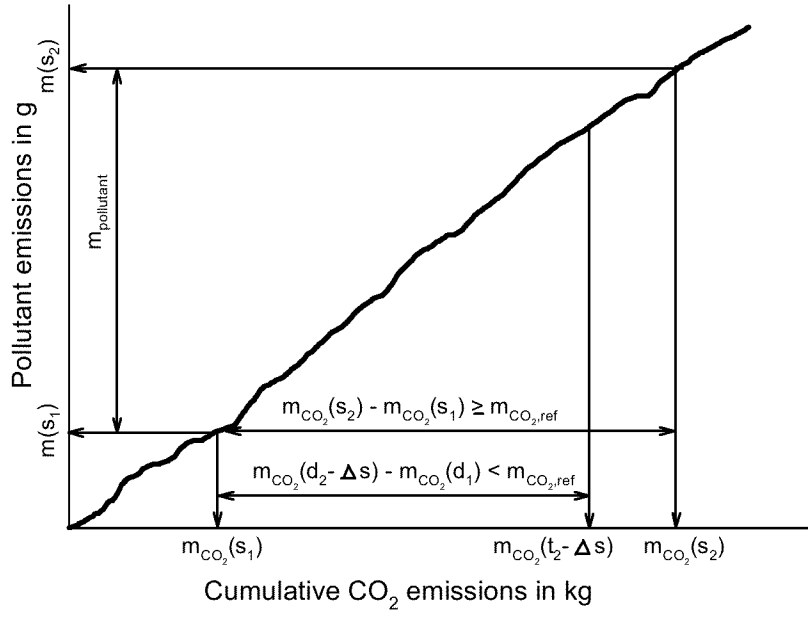

Figure 10: Schematic overview of the procedure to determine the duration of an averaging window with the CO_2 mass-based method

The CO_2 mass is calculated per window by integrating, i.e., adding the instantaneous CO_2 emissions measured with PEMS. In order to obtain a sufficient amount of data that can be used for analysis, a vehicle should emit during PEMS on-road testing at least a cumulative CO_2 mass that is equal to the cumulative CO_2 mass emitted during NEDC testing. For example, the first averaging window for Vehicle A (see Table 3) ends at a distance at which the vehicle has emitted cumulative CO_2 emissions of 2.00 kg; likewise, the averaging window for vehicle B (see Table 3) covers a distance equivalent to the cumulative CO_2 emissions of 1.86 kg. The averaging window method generally takes all measurements into account, thereby smoothing emissions data and reducing the interference of measurement spikes.

The applied averaging window method implies a peculiarity that deserves attention: The averaging window method gives unequal weight to emissions data because individual data points have different probabilities of belonging to a certain window. In particular emissions data obtained in the middle of a test procedure might be part of multiple windows where as emissions data in the beginning or at the end of an emissions test might be part of only one or a few averaging windows. This shortcoming is relevant for cold start emissions that are contained only in a few averaging windows, thus being underrepresented in the sample of averaging window emissions. We consider this problem minor with respect to the general findings of this report, in particular because cold-start emissions are specifically addressed in a separate section.

In line with Euro 3-5 emission limits, this report presents emissions uniformly in grams of per kilometre [g/km]. The presented uncertainty intervals for the route-specific average emissions indicate the maximum emissions measured over an entire test route. This approach is justified because for future emissions legislation it may be most relevant to obtain insight into the maximum level of emissions that might occur during on-road driving rather than into the overall variability of on-road emissions.

Next to presenting distance-specific emissions, also dimensionless deviation ratios (DR) are calculated. Deviation ratios present an indicator for the deviation between actual on-road emissions and the Euro 3-5 emission limits. The deviation ratio for each individual averaging window and each individual pollutant is defined as:

$$DR = \frac{DR_I}{DR_C} \qquad \text{(Equation 4)}$$

where DR_I = in-use deviation ratio
DR_C = certification deviation ratio

Both parameters are defined as:

$$DR_I = \frac{m}{s(t_2) - s(t_1)} \qquad \text{(Equation 5)}$$

$$DR_C = \frac{m_L}{s_{NEDC}} \qquad \text{(Equation 6)}$$

VW FOIA, EPA 06/20/2017 2017-FFP_027147

where: m = the mass of the respective pollutant emitted during one averaging window [g/window]

$s(t_2)$-$s(t_1)$ = the actual distance travelled by the vehicle during each individual averaging window [km/window]

m_L = the mass of the respective pollutant emitted during one NEDC driving cycle according to the Euro 3-5 emission limits [g]

s_{NEDC} = the reference distance of the NEDC driving cycle, i.e., 11.007 km

The reference pollutant mass of m_L differs depending on the applicable emission limit. The deviation ratios are calculated by using the travel distance as reference because emission limits for light-duty vehicles are defined as distance-specific values. The deviation ratios therefore differ from the so-called conformity factors that are used to characterize on-road emissions of heavy-duty vehicles by using engine work as reference quantity. The differences between both indicators and potential impacts on our results are discussed in Section 5.1.

To analyze the emission performance of vehicles under cold-start conditions, emissions during the first 300 seconds of each PEMS test were analyzed separately. During the cold start period, the various test routes differ in their characteristics only marginally from each other. Therefore, individual test routes were not differentiated. Instead average and maximum cold start emissions were calculated by combining the cold start sections of all test routes. The report continues with presenting the results of the on-road emissions testing with PEMS.

VW FOIA, EPA 06/20/2017 2017-FFP_027148

4 Results

This section presents the results of the PEMS test campaign for 12 gasoline and diesel vehicles that comply with Euro 3-5 emission limits. Special attention is paid to on-road emissions of Euro 5 vehicles because these vehicles are the most modern among the test vehicles and have to comply during NEDC testing with the currently enforced emission limits. This section continues by presenting on-road emissions for each vehicle as averages over the entire test routes (Section 4.1). Based on these results, Section 4.2 focuses in greater detail on NO_X emissions of Euro 5 vehicles, addressing in particular:

(i) the on-road emissions of Euro 5 vehicles in comparison to Euro 5 emission limits
(ii) on-road emissions of Euro 5 vehicles in comparison to Euro 3 and Euro 4 vehicles

Section 4.3 presents cold start emissions, i.e., emissions occurring during the first 300 seconds of the PEMS tests.

4.1 Average on-road emissions of light-duty vehicles

This section presents average emissions of NO_X, THC, CO, and CO_2 for the various light-duty vehicles and test routes. The average emissions are presented for each pollutant with two metrics as (i) distance-specific emissions [g/km] and (ii) dimensionless deviation ratios. The variability of emissions is indicated by error bars that present the maximum emissions measured for a vehicle on the various test routes. The PEMS results on NO_X emissions in Figures 11 and 12 show that:

(i) On-road NO_X emissions of gasoline vehicles generally stay within Euro 3-5 emission limits whereas NO_X emissions of diesel vehicles substantially exceed Euro 3-5 emission limits up to a factor of 2-4 if averaged over entire test routes.
(ii) On-road NO_X emissions show a relatively small decline from Euro 3 to Euro 5 diesel vehicles. This decline is substantially smaller than the stringency of Euro 3 to Euro 5 emission limits would suggest.
(iii) PEMS results suggest that there is no decline in the on-road NO_X emissions of Euro 3 towards Euro 5 gasoline vehicles.
(iv) On-road NO_X emissions are highest during extreme uphill-downhill driving and during driving on the Motorway at high velocities. This finding might be explained by insufficient exhaust gas recirculation at high engine loads during uphill and high-speed driving as well as decreased catalyst efficiency at cold start or during cool-down while down-hill driving and idling.
(v) The error intervals indicate substantial variability in the on-road NO_X emissions even if vehicles are driven on identical routes and thus under supposedly similar load pattern and driving conditions. This finding indicates the relatively high variability of on-road vehicle operating conditions.
(vi) Several diesel vehicles fail to meet the Euro 3-5 emission limits when tested with the NEDC; this finding might be partially attributed to deviations in chassis dynamometer settings and vehicle characteristics from type approval conditions.

VW FOIA, EPA 06/20/2017 2017-FFP_027149

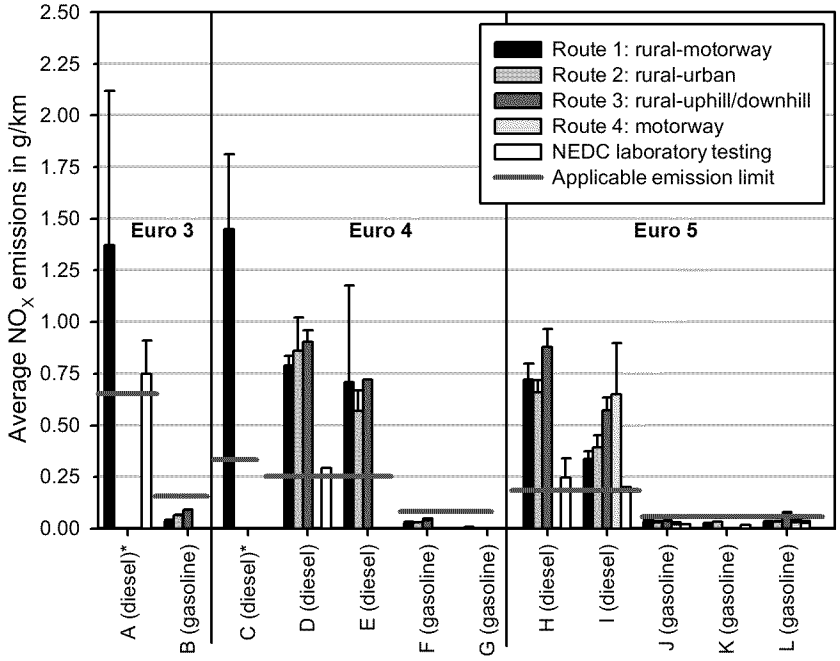

Figure 11: Average NO_X emissions on the PEMS test routes and during NEDC testing in the laboratory; uncertainty intervals indicate the maximum average emissions for each test and vehicle; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

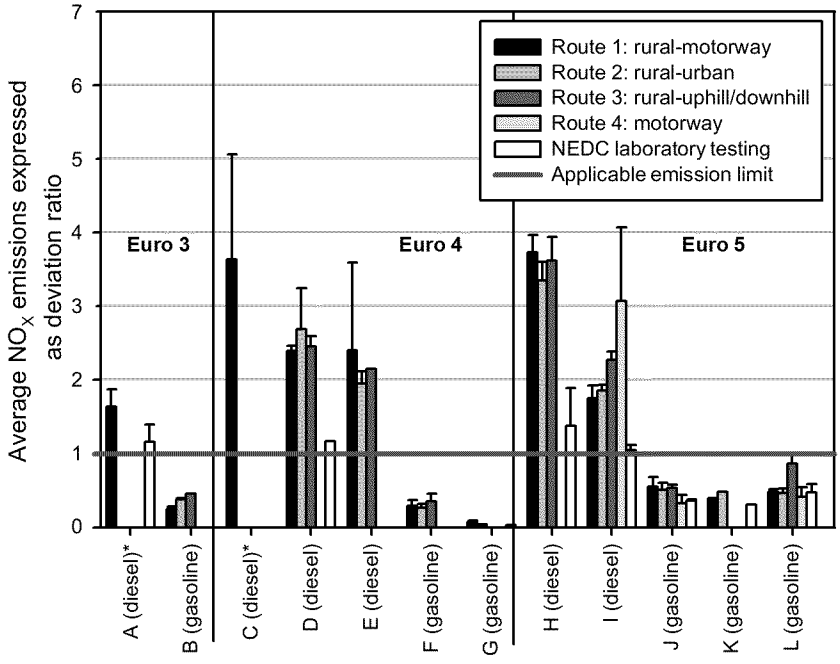

Figure 12: Average NO_X emissions on the PEMS test routes and during NEDC testing in the laboratory expressed as deviation ratio; uncertainty intervals indicate the maximum average emissions for each test route and vehicle; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

In summary, the PEMS results indicate that the increasing stringency of Euro 3 to Euro 5 emission limits did not lead to a substantial decline in the off-cycle on-road NO_X emissions of light-duty diesel vehicles. On-road NO_X emissions of current Euro 5 light-duty diesel vehicles might exceed

VW FOIA, EPA 06/20/2017 2017-FFP_027150

emission limits by up to a factor of four, depending on driving conditions. These results confirm earlier findings by Pelkmans and Debal (2006) and Vojtisek-Lom et al. (2009), who reported that NO_X emissions during off-cycle and on-road driving of five light-duty diesel vehicles substantially exceeded both Euro 3-4 emission limits. Overall, the results indicate that the standardized NEDC testing is clearly limited in capturing the diversity of emissions as they occur during on-road driving and may not fulfil the requirements defined by Regulation 715/2007 EC (2007a).

Of the total NO_X emissions, NO_2 is of particular interest because of its direct adverse environmental and health effects. The PEMS measurements indicate that:

(i) NO_2 emissions of gasoline vehicles are negligible in comparison to the emissions of diesel vehicles (Figures 13 and 14).

(ii) The share of NO_2 in the total NO_X emissions is substantially higher for diesel than for gasoline vehicles.

(iii) NO_2 might reach a share of up to 60% in the total NO_X emissions of diesel vehicles; the results do not allow drawing conclusions on whether this share increased from Euro 3 to Euro 5 vehicles.

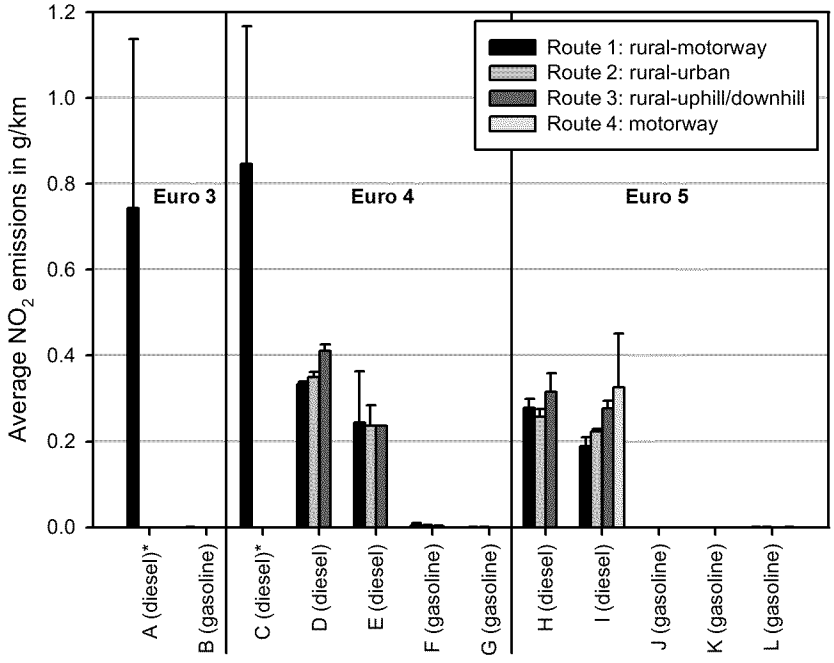

Figure 13: Average NO_2 emissions on the PEMS test routes; uncertainty intervals indicate the maximum average emissions for each test and vehicle; NO_2 was not measured during NEDC testing; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

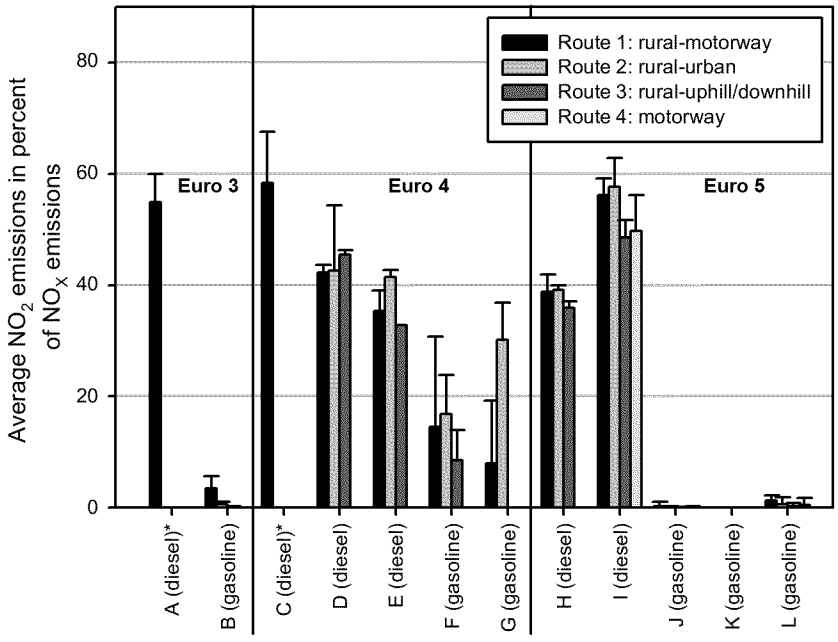

Figure 14: Average NO_2 emissions on the PEMS test routes expressed as percentage of average NO_X emissions; uncertainty intervals indicate the maximum average emissions for each test and vehicle; NO_2 was not measured during NEDC testing; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

In contrast to the on-road NO_X emissions, both on-road CO and THC emissions generally stay below Euro 3-5 emission limits. Figures 15 and 16 indicate that:

(i) On-road CO emissions of both diesel and gasoline vehicles generally stay below Euro 3-5 emission limits.

(ii) The results do not allow identifying a trend towards lower CO emissions from Euro 3 to Euro 5 diesel and gasoline vehicles.

(iii) The Euro 5 gasoline vehicle L shows exceptionally high emissions during extreme uphill-downhill as well as high-speed driving. The high CO emissions are associated with elevated THC emissions (see below) and high catalyst temperatures of up to 400 °C. The insufficient oxidation of carbon monoxide during uphill and high-speed driving points to insufficient catalytic conversion and requires further analyses.

VW FOIA, EPA 06/20/2017 2017-FFP_027152

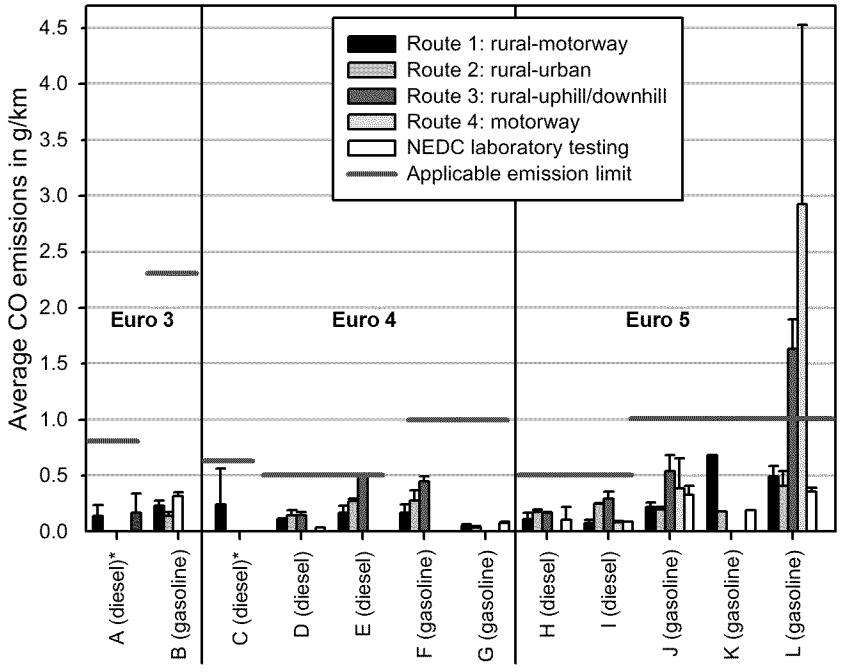

Figure 15: Average CO emissions on the PEMS test routes and during NEDC testing in the laboratory; uncertainty intervals indicate the maximum average emissions for each test route and vehicle; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

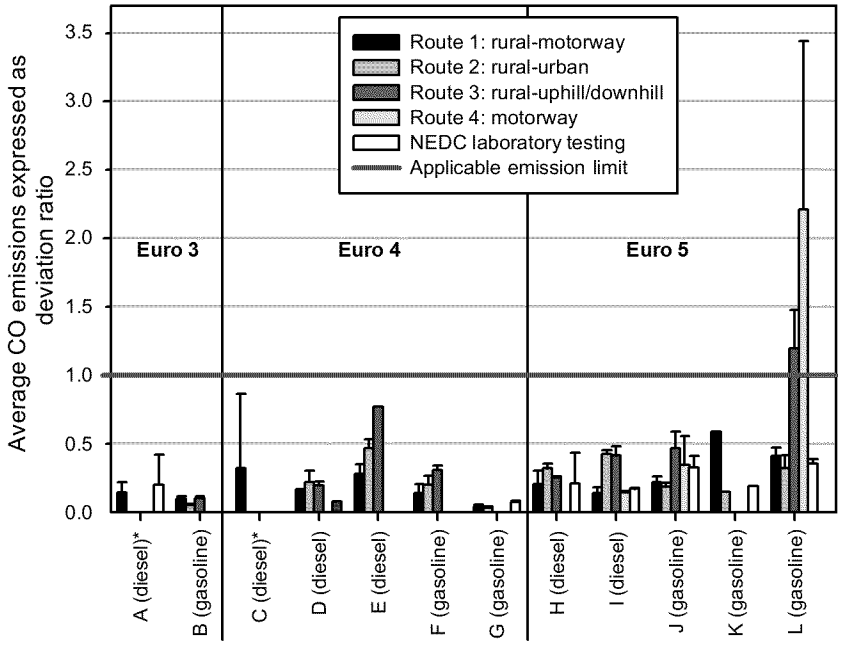

Figure 16: Average CO emissions on the PEMS test routes and during NEDC testing in the laboratory expressed as deviation ratio; uncertainty intervals indicate the maximum emissions for each test route and vehicle; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

The THC emissions of all diesel and gasoline vehicles remain below Euro 3-5 emission limits during the PEMS test campaign. The results can be summarized as follows (Figures 17 and 18):

(i) THC emissions of diesel and gasoline vehicles remain far below Euro 3-5 emission limits.

(ii) THC emissions generally increase from Euro 3 to Euro 5 gasoline vehicles both in absolute terms and as percentage of Euro 3-5 emission limits.

(iii) THC emissions of diesel and gasoline vehicles are generally higher during NEDC testing than they are on the road.

(iv) The Euro 5 gasoline Vehicle L shows higher THC emissions than all other test vehicles; the elevated emissions are associated with catalyst temperatures of up to 400 ^{O}C, suggesting low catalytic conversion rates.

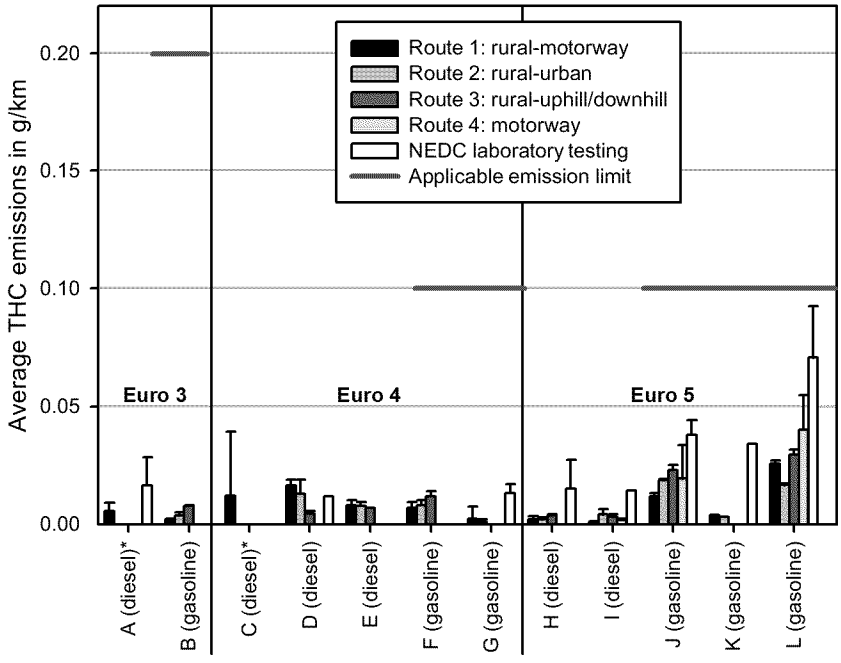

Figure 17: Average THC emissions on the PEMS test routes and during NEDC testing in the laboratory; uncertainty intervals indicate the maximum average emissions for each test route and vehicle; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

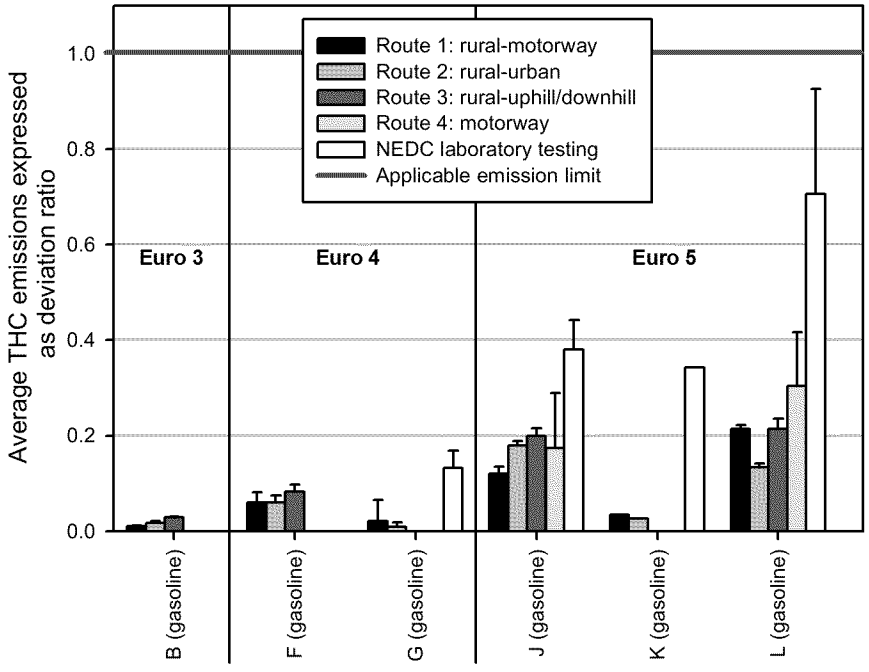

Figure 18: Average THC emissions on the PEMS test routes and during NEDC testing in the laboratory expressed as deviation ratio; uncertainty intervals indicate the maximum average emissions for each test route and vehicle

The PEMS measurements indicated so far that on-road NO_X emissions of diesel vehicles substantially exceed substantially Euro 3-5 emission limits, whereas on-road CO and THC emissions generally remain below the limits. Next to regulated pollutants, on-road CO_2 emissions are of particular interest to policy makers. To reduce greenhouse gas emissions from transport, the European commission sets a target of 130 g CO_2/km for new passenger cars of a reference mass of 1372 kg (EC, 2009a). For reasons of simplicity, we uniformly use here 130 g CO_2/km as benchmark for all test vehicles, thereby disregarding the specific mass of vehicles. The PEMS measurements indicate that (Figures 19-21):

(i) The average on-road CO_2 emissions of all vehicles tested on the four PEMS test routes amount to 176 ± 42 g/km. Diesel vehicles emit on average 189 ± 51 g/km, whereas gasoline vehicles emit 162 ± 29 g/km CO_2. Thus, on-road emissions substantially exceed the European Commissions fleet-average emissions target of 130 g/km (EC, 2009a).

(ii) The on-road CO_2 emissions of test vehicles exceed the emissions as specified during NEDC type approval by on average 21 ± 9%. Diesel vehicles show a deviation of 24 ± 8% and gasoline vehicles of 18 ± 10%. Still, these deviations might increase if vehicles are driven at extremely high speeds, e.g., as it frequently occurs on the German Autobahn.

(iii) The average CO_2 emissions during NEDC laboratory tests exceed the emission values as specified during NEDC type approval by 15 ± 10%. This deviation might be explained by differences regarding vehicle preparation (e.g., brand, dimension, air pressure of tyres, level of battery charge) as well as specific settings of the chassis dynamometer.

The report presented so far on-road emissions as averages over entire test routes. The next section analyzes in greater detail the on-road NO_X emissions of Euro 5 vehicles by making use of the averaging window calculations.

4.2 On-road NO_X emissions of Euro 5 light-duty vehicles

4.2.1 On-road NO_X emissions of Euro 5 vehicles versus Euro 5 emission limits

The results of the previous section indicate that on-road NO_X emissions of Euro 5 diesel vehicles may substantially exceed the Euro 5 emission limit. This section analyzes now in greater detail the NO_X emissions of Euro 5 vehicles with the averaging window method (see Section 3.4.2 for methodological details). The analysis shows that for almost any driving conditions the two tested Euro 5 diesel vehicles emit more NO_X than specified by the Euro 5 limit of 0.18 g/km (Figures 22-25). The key findings are:

(i) The average NO_X emissions of all averaging windows exceed the Euro 5 emission limit in the case of Vehicle H; the average NO_X emissions of at least 80% of the averaging windows exceed the Euro 5 emission limit in the case of Vehicle I, depending on the route driven.

(ii) Uphill/downhill driving on Route 3 is associated with particularly high NO_X emissions; the average NO_X emissions of all averaging windows for Vehicles H and I exceed the Euro 5 emission limit on this test route; roughly 20% of the averaging window emissions exceed the Euro 5 limit by more than 8 times. This finding points to fuel consumption, i.e., engine load as critical parameter determining the NO_X emissions of diesel vehicles.

(iii) The distribution of the averaging window NO_X emissions shows considerable variability, which is higher between different test routes than between individual tests on identical test routes.

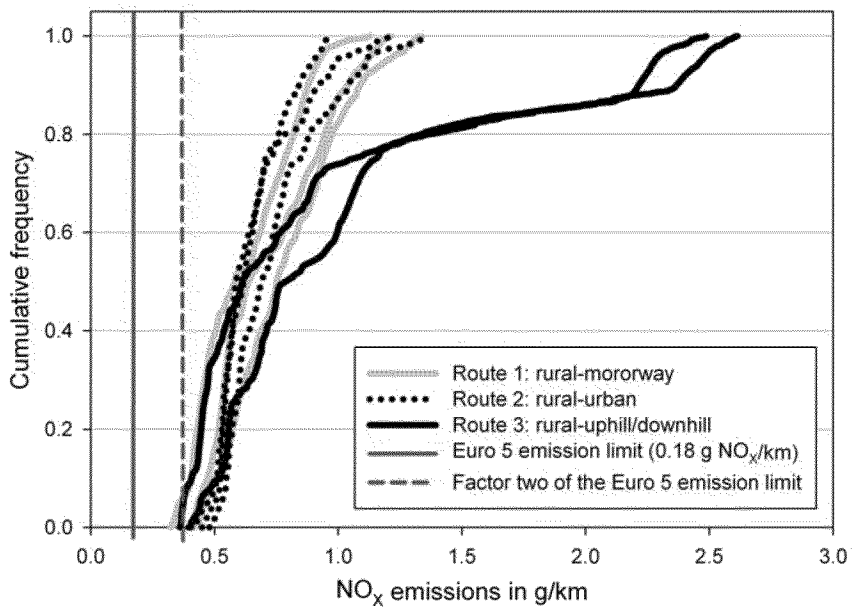

Figure 22: Averaging window NO_X emissions of EURO 5 diesel Vehicle H

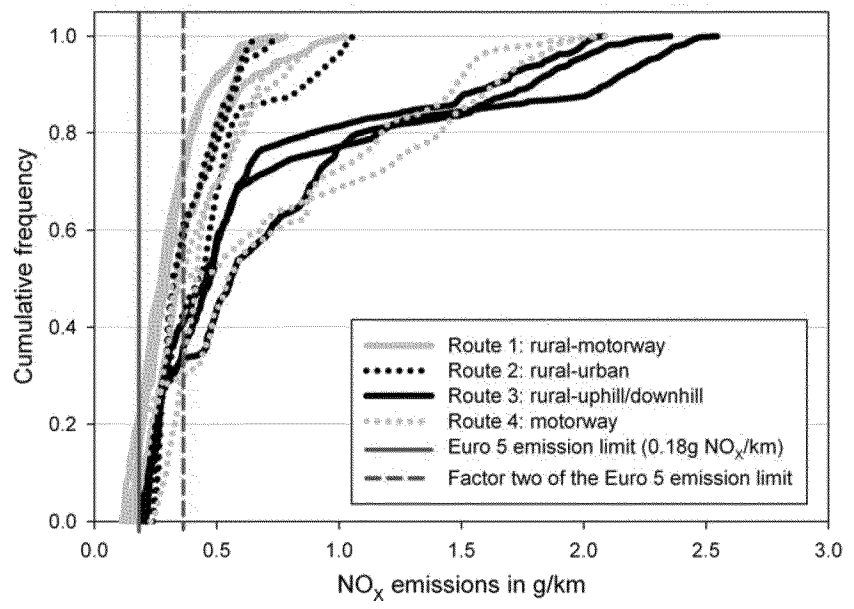

Figure 23: Averaging window NO_X emissions of EURO 5 diesel Vehicle I

VW FOIA, EPA 06/20/2017 2017-FFP_027158

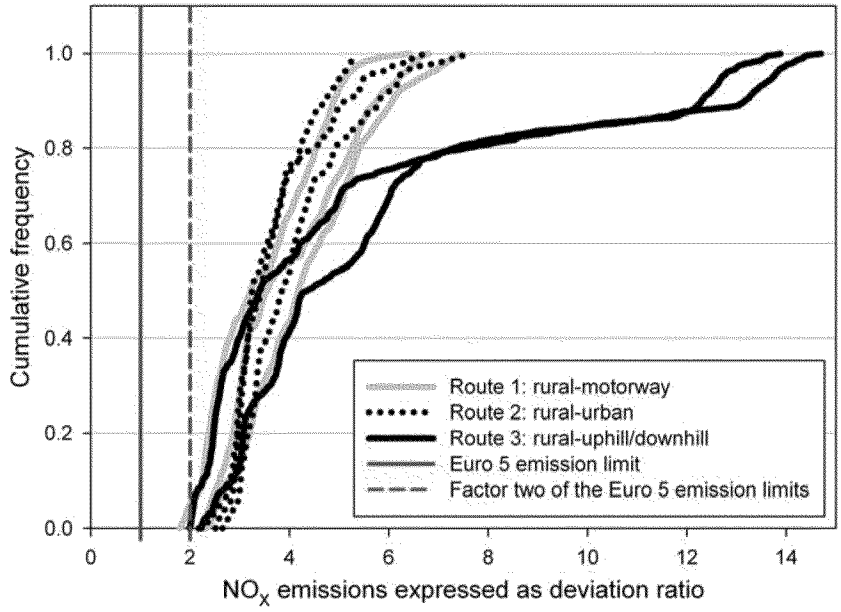

Figure 24: Averaging window NO_X emissions of EURO 5 diesel Vehicle H expressed as deviation ratio

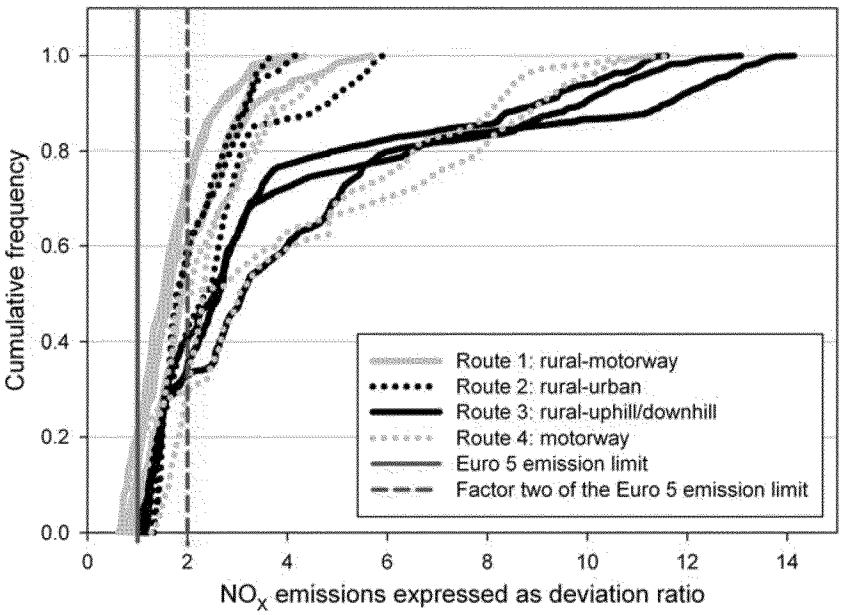

Figure 25: Averaging window NO_X emissions of EURO 5 diesel Vehicle I expressed as deviation ratio

In conclusion, the results indicate that the magnitude of NO_X emissions of Euro 5 diesel vehicles depends on vehicle velocity and operation mode but substantially exceeds under almost all on-road driving conditions the Euro 5 emission limit. This finding presents a sharp contrast to Euro 5 gasoline vehicles, for which NO_X emission remain for most of the averaging windows below the Euro 5 limit of 0.06 g/km (Figure 26). The key findings for Euro 5 gasoline vehicles are:

(i) NO_X emissions remain for the majority of averaging windows below the Euro 5 emission limit.

(ii) Even on the very severe Route 3, at maximum 40% of the averaging windows exceed the Euro 5 emission limit (Vehicle L). However, NO_X emissions of a very few averaging windows might exceed the limit by more than three times under these driving conditions.

(iii) Particularly high NO_X emissions occur at velocities higher than 120 km/h, under extreme uphill/downhill driving, during the cold-start phase, and during idling in urban driving. This finding points to fuel consumption (i.e., engine load) as well as catalyst temperature (which is low during cold start and might decline during long downhill and idling passages) as critical parameters for NO_X emissions. This finding further indicates, which driving pattern should be critically considered during type approval to achieve an effective reduction of on-road NO_X emissions.

(iv) The high NO_X emissions during low-velocity driving on Routes 1 and 2 are likely to be caused by both cold start and long idling periods. In the latter case, the catalyst cools down while the engine produces emissions although the vehicle's velocity is zero.

Caution is, however, required before drawing conclusions about the high emission levels of Euro 5 gasoline vehicles on Routes 1 and 2. Additional evaluation in Section 4.2.3 shall explore to which extent idling actually explains high NO_X emissions at low velocity and whether alternative metrics for data analysis should be employed to correct for the bias introduced by idling operation into the results.

VW FOIA, EPA 06/20/2017 2017-FFP_027160

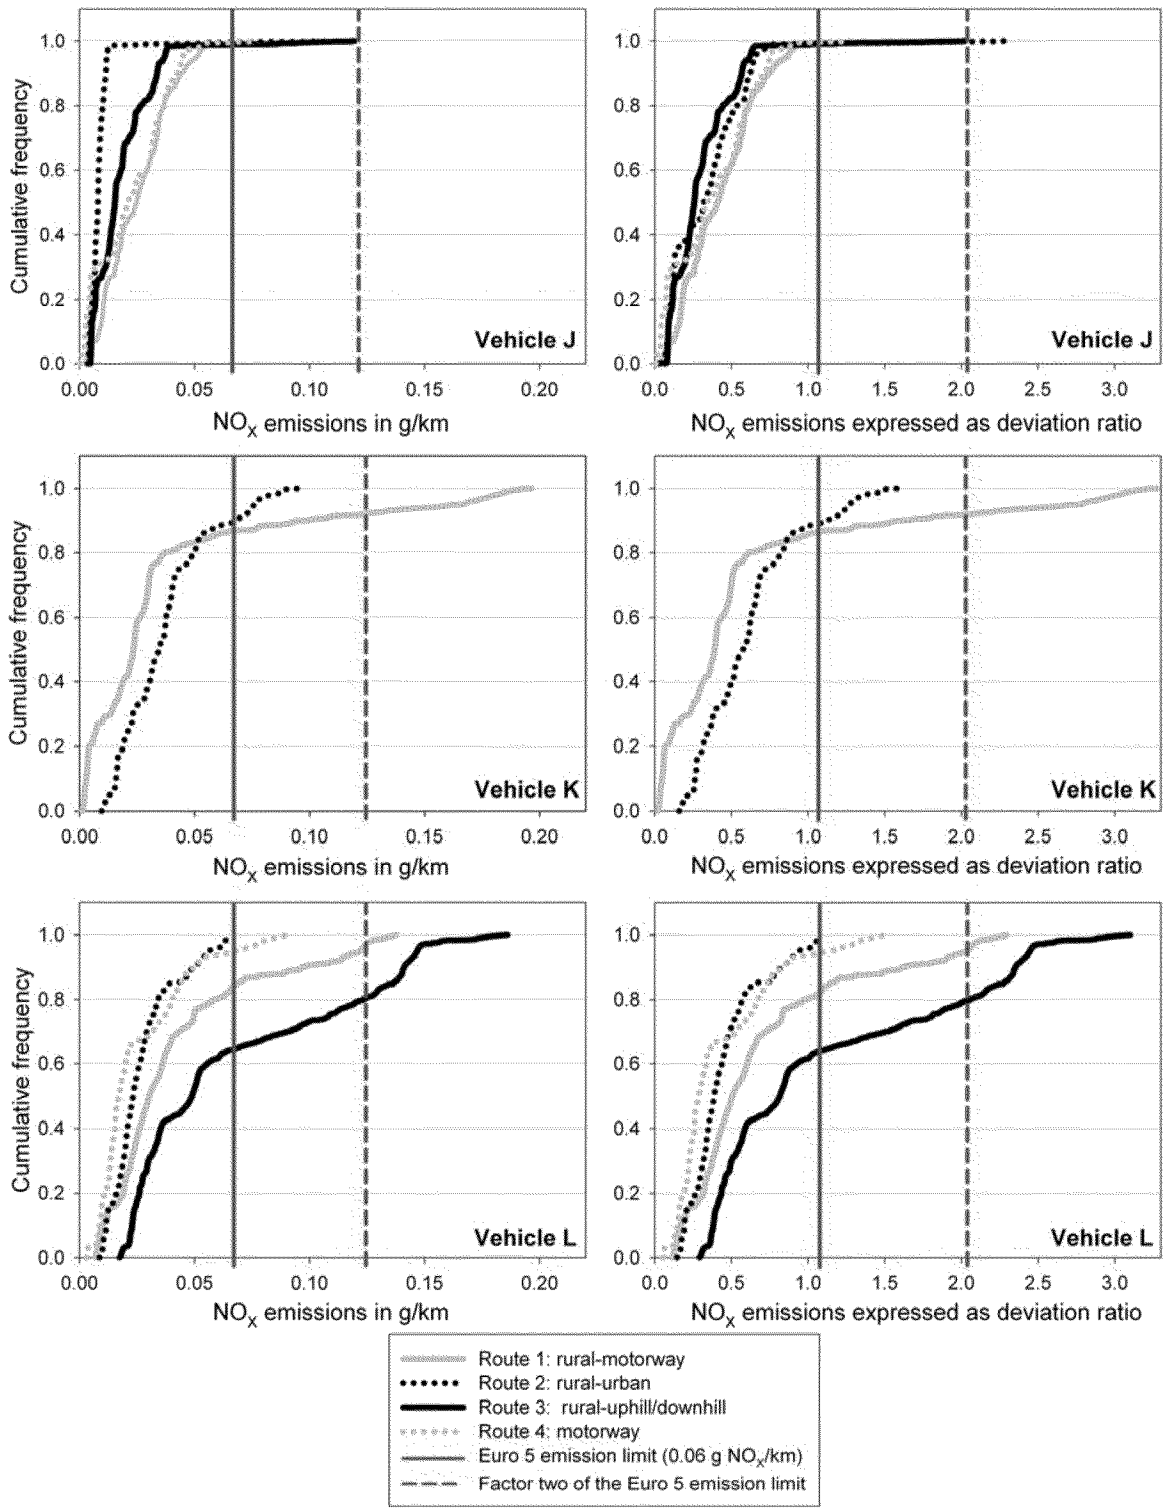

Figure 26: Averaging window NO_X emissions of Euro 5 gasoline vehicles; results given for only one randomly selected PEMS test for each vehicle and test route

4.2.2 Comparison of on-road NO_X emissions of Euro 3-5 vehicles

The previous section focussed solely on Euro 5 vehicles. This section now compares the averaging window NO_X emissions of Euro 3-5 vehicles based on one, randomly selected PEMS test per vehicle and test route (Figures 27 and 28). The findings are consistent with the route-average NO_X emissions identified in Section 4.1 and indicate that:

(i) Averaging window NO_X emissions of diesel vehicles in general substantially exceed the Euro 3-5 emission limit, while varying over a large range of values.

(ii) Averaging window NO_X emissions show a decline from Euro 3 to Euro 5 diesel vehicles, albeit at relatively large variability.

(iii) The highest averaging window NO_X emissions typically occur during demanding uphill/downhill driving on Route 3 and at high speeds on the motorway (Route 4).

By contrast, the findings for gasoline vehicles (Figure 28) indicate that:

(i) The majority of averaging window emissions remains below the Euro 3-5 emission limits although NO_X emissions vary over a large value range.

(ii) A few averaging windows substantially exceed the Euro 3-5 emission limits. These windows often include the cold-start, which is characterized by a low catalyst temperature and thus conversion efficiency.

(iii) The high emissions of Vehicle H on Route 3 present an exception among gasoline vehicles and warrant further and more detailed analyses.

In particular the results for gasoline vehicles indicate substantially elevated emissions during cold start. The next section addresses therefore cold-start emission in greater detail.

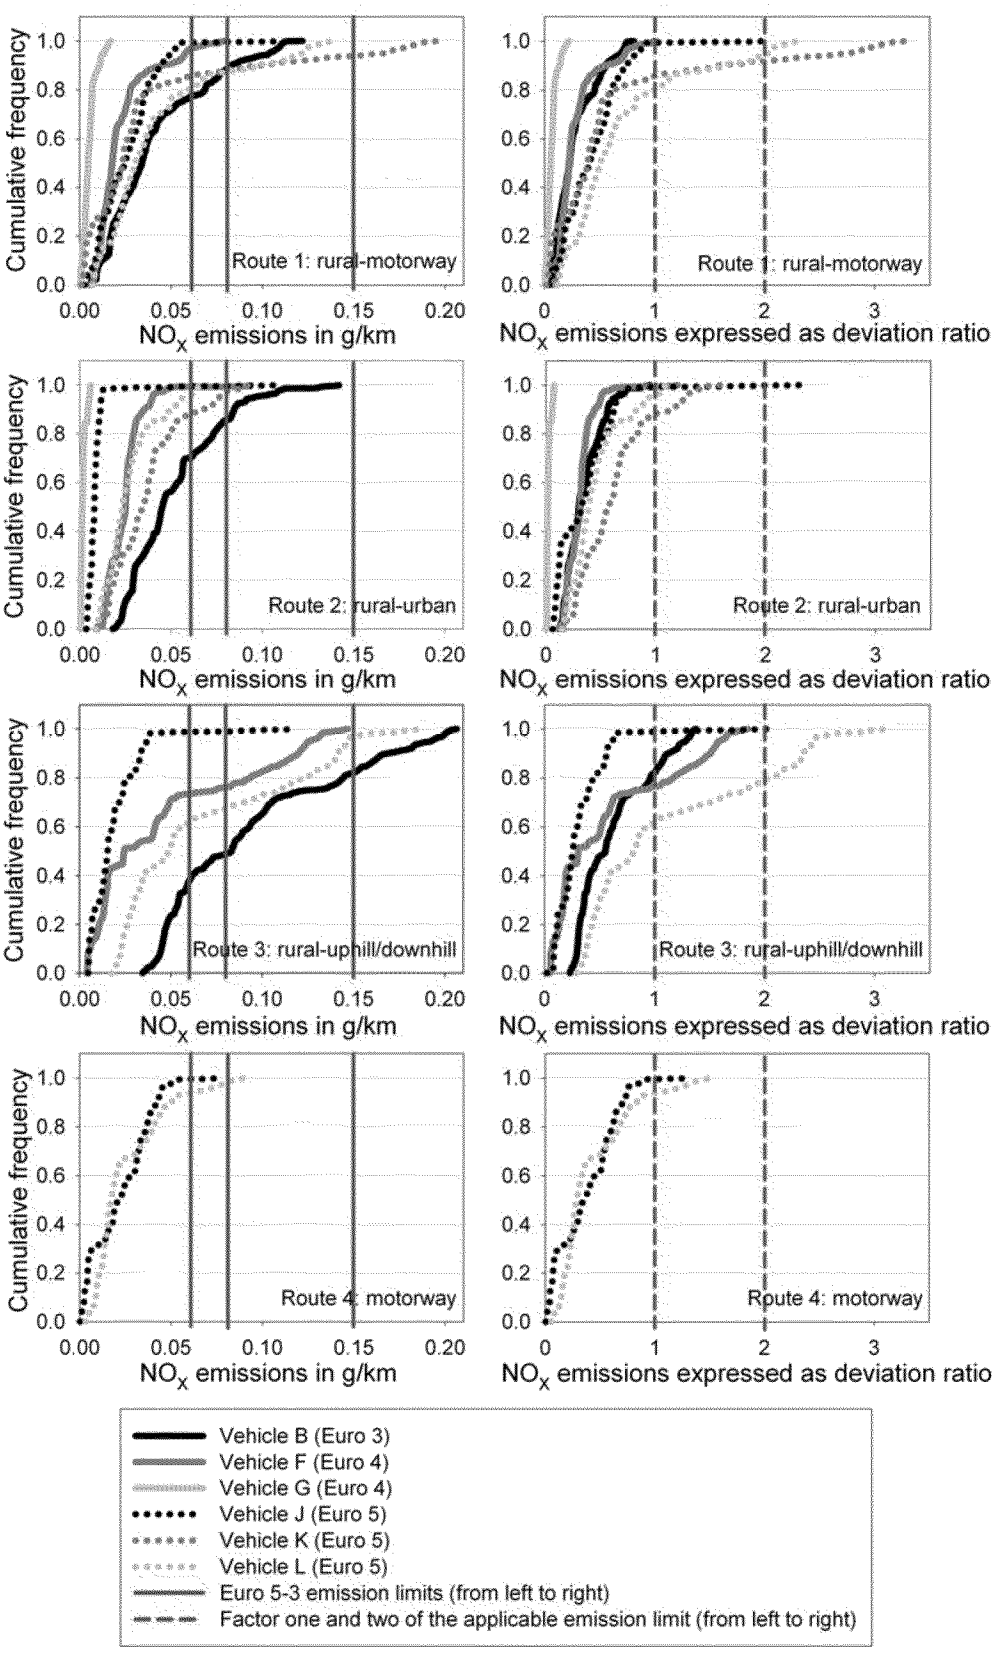

Figure 28: Comparison of the averaging window NO_X emissions of Euro 3-5 gasoline vehicles on the four PEMS test routes

VW FOIA, EPA 06/20/2017 2017-FFP_027164

4.3 Cold start emissions

Low catalyst temperatures typically limit the effectiveness of the catalytic conversions during cold start. Cold start emissions are of particular interest because these generally occur in urban areas and might substantially exceed average on-road emissions levels. The analysis of cold-start emissions focuses on the first 300 seconds of each PEMS emissions test. The various test routes were not differentiated because driving conditions are relative similar during this initial time period for all test routes. Cold-start emissions are presented in the following for each light-duty vehicle individually as averages over all four test routes (Figures 29 and 30).

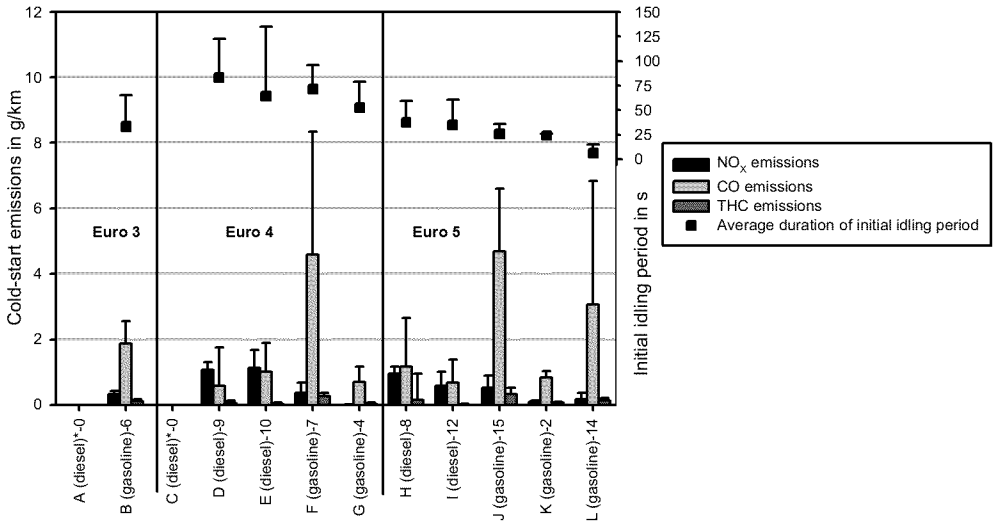

Figure 29: Average cold-start emissions and initial idling periods of light-duty vehicles; numbers below the x-axis indicate the amount of individual PEMS tests included in this analysis; uncertainty intervals indicate the maximum cold-start emissions identified for each respective vehicle; * Vehicles A and C (see Table 3) are excluded because the driving distance during the cold-start period could not be retrieved from the GPS system

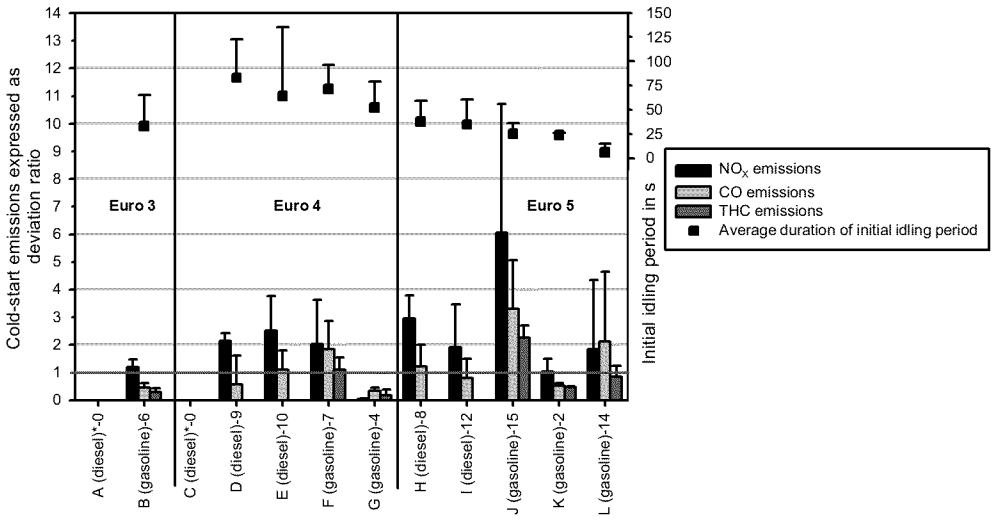

Figure 30: Average cold-start emissions expressed as deviation ratio and initial idling periods of light-duty vehicles; numbers below the x-axis indicate the amount of individual PEMS tests included in this analysis; uncertainty intervals indicate the maximum cold-start emissions identified for each respective vehicle; * Vehicles A and C (see Table 3) are excluded because the driving distance during the cold-start period could not be retrieved from the GPS system

The results presented in Figures 29 and 30 can be summarized as follows:

(i) The data do not indicate a trend towards lower cold-start emissions from Euro 3 to Euro 5 diesel and gasoline vehicles.

(ii) Cold-start emissions of both diesel and gasoline vehicles generally exceed Euro 3-5 emission limits. Cold-start NO_X emissions are always higher than the Euro 3-5 limits; CO emissions often exceed the emission limits; THC emissions are both below and above the Euro 3-5 limits.

(iii) Cold-start emissions are slightly higher than the average on-road emissions in the case of NO_X but substantially exceed the average on-road emissions in the case of CO and THC.

(iv) Cold-start emissions of individual vehicles span over a relative large value range. This suggests that environmental conditions (e.g., lower or higher ambient temperatures) in combination with changing driving pattern (e.g., longer or shorter idling periods) might substantially affect the results. In particular the duration of initial idling periods might have a substantial effect on the distance-specific cold-start emissions. More detailed analysis is warranted to quantify the magnitude of this effect on the results presented in Figures 29 and 30.

More detailed insights into cold-start emission pattern can be obtained by plotting both emissions and tailpipe temperature as function of time (Figures 31 and 32). The examples of diesel Vehicle H and gasoline Vehicle L indicate that pollutant concentrations in the exhaust are often particularly high directly after the start of the engine. At this point, exhaust and catalyst temperatures are particularly low, causing a low efficiency in the oxidation of CO and THC. The NO_X concentrations in the exhaust of diesel Vehicle H show large fluctuations but no obvious temperature dependency in the cold start phase. This finding results from the absence of catalytic NO_X oxidation in the emissions treatment system. By contrast, NO_X concentrations in the exhaust of gasoline Vehicle L decline directly after engine start. This finding points again to the temperature-dependent efficiency of three-way catalysts in gasoline vehicles.

5 Discussion

5.1 Data analysis and results

The on-road PEMS measurements indicate that in particular on-road NO_X emissions of light-duty diesel vehicles substantially exceed the Euro 3-5 emission limits, whereas on-road CO and THC emissions generally remain below the Euro 3-5 emission limits. These findings can be regarded as reliable and robust. Interpreting the deviation ratios of averaging window emissions, however, deserves special attention because this parameter differs from the so-called conformity factor that is used to characterize emissions of heavy duty vehicles (EC, 2010). First we reiterate the methodology for calculating both deviation ratios and conformity factors. Afterward, a comparison of deviation ratios and conformity factors calculated as a sample case for the averaging window emissions of one selected light-duty vehicle is presented.

Section 3.4.2 describes in detail the methodology for calculating deviation ratios. Conformity factors are calculated based on a similar method, with the exception that now engine work is used as reference quantity instead of travel distance as it is the case for deviation ratios (see Section 3.4.2). This approach is chosen to assure consistency with both the method used to define the duration of averaging windows and the definition of emission limits for heavy-duty vehicles (Bonnel and Kubelt, 2010; EC, 2009b, 2010).

To analyze the differences between the two parameters, also conformity factors for one light duty vehicle were calculated as a sample case. For this calculation, we approximate engine work by the CO_2 mass emitted. Per definition, the cumulative CO_2 mass emitted during one averaging window equals the cumulative CO_2 mass emitted during a standard NEDC test. Therefore, the conformity factor simplifies in this sensitivity analysis to the quotient of measured averaging window emissions and the respective Euro 5 emission limit (see also Equations 3-5 in Section 3.4.2):

$$CF = \frac{CF_I}{CF_C} = \frac{\frac{m}{m_{CO_2}(t_2) - m_{CO_2}(t_1)}}{\frac{m_L}{m_{CO_2;NEDC}}} = \frac{m}{m_L} \text{ ,if} \qquad \text{(Equation 7)}$$

$$m_{CO_2}(t_2) - m_{CO_2}(t_1) = m_{CO_2;NEDC} \qquad \text{(Equation 8)}$$

where:
- CF = conformity factor
- CF_I = in-use conformity factor
- CF_C = certification conformity factor
- m = mass of emissions; indices having the same meaning as in Equations 3-5

Based on this calculation, it is now possible to understand the difference between deviation ratio and conformity factor: In the case of the deviation ration, the distance driven by a vehicle on the road most likely differs from the distance of the NEDC cycle, even if the CO_2 masses on-road and during NEDC testing are identical. For example, if a vehicle is driven on the challenging uphill/downhill Route 3, it might consume more fuel, thus emit more CO_2 than under NEDC condition,

and thus travelling a shorter distance until it has emitted a CO_2 mass equivalent to the one emitted during NEDC testing. In such a case, the deviation ratio increases by the fraction of window distance to NEDC distance. Consequently, it is precisely this fraction between window distance and NEDC distance that represents the difference between deviation ratio and conformity factor. Since the measured on-road fuel consumption and the associated CO_2 emissions exceed the CO_2 emissions during NEDC testing by on average 21 ± 9% (see Section 4.1) it can be expected that the deviation ratio generally exceeds the conformity factor. Figure 33 indicates that this is indeed the case in our sample analysis for Vehicle L.

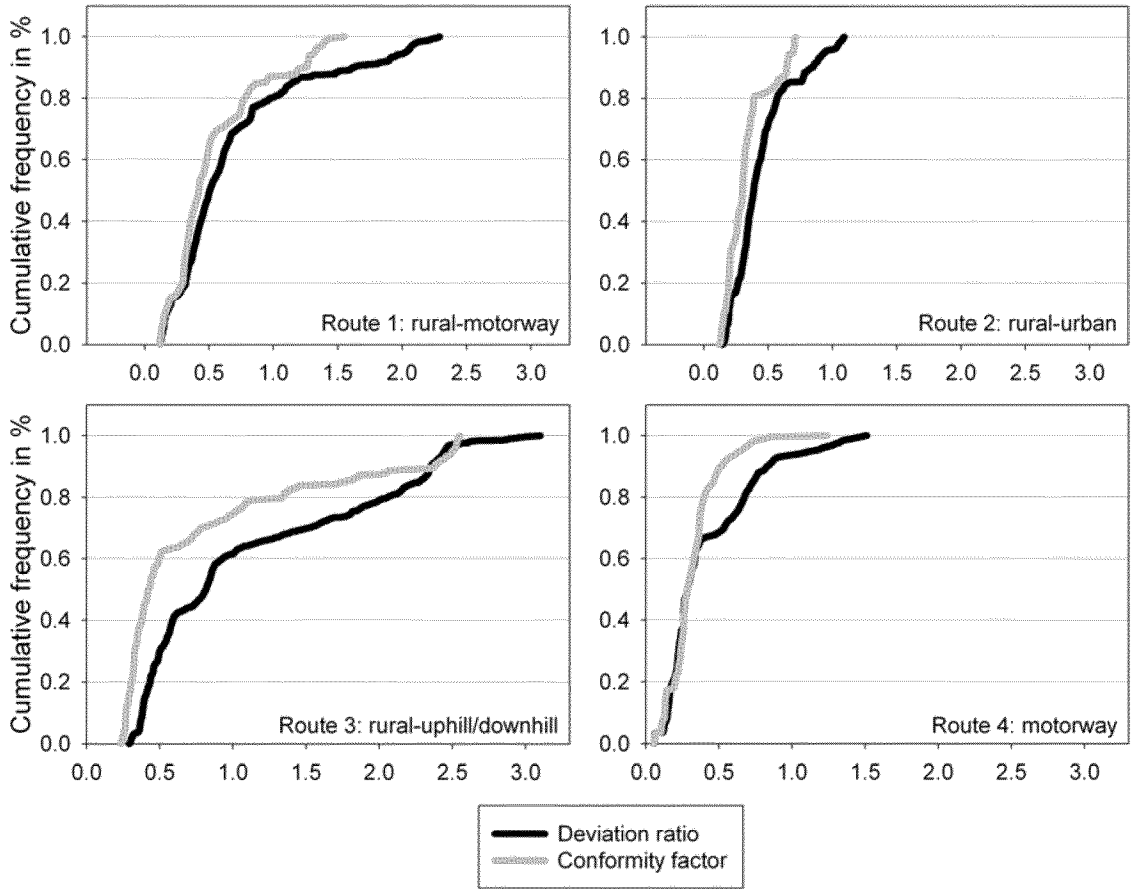

Figure 33: Cumulative frequency distribution of averaging window NO_X emissions of Vehicle L expressed as deviation ratio and conformity factor

By focusing in detail on Route 1, the data furthermore indicate that both deviation ratio and conformity factor of averaging window NO_X emissions show a positively skewed distribution (Figure 34). The peak of the frequency distribution of deviation ratios is located at 0.37, whereas the peak of the distribution of conformity factors is located at 0.28. A similar pattern can also be expected for other vehicles and pollutant emissions. This finding indicates that the majority of emissions are slightly lower than the average, while for a minority averaging windows, emissions are substantially elevated.

The distinct properties of deviation ratio and conformity factor suggest that both parameters should serve slightly different purposes:

VW FOIA, EPA 06/20/2017 2017-FFP_027170

(i) The deviation ratio is best used to indicate the ratio of distance-specific emissions to distance-specific emission limits as specified for light-duty vehicles.

(ii) The conformity factor serves best to compare work-specific emissions with work-specific emission limits as specified for heavy-duty vehicles.

The conformity factor is independent of distance; it may therefore provide a robust evaluation of emissions during long idling periods. In the case of idling, the distance travelled during in an averaging window may decrease substantially and theoretically lead to a considerable increase in the deviation ratio. This problem links to the shortcoming of a distance-specific definition of emission limits for light-duty vehicles that does not permit to link emissions to actual engine parameters.

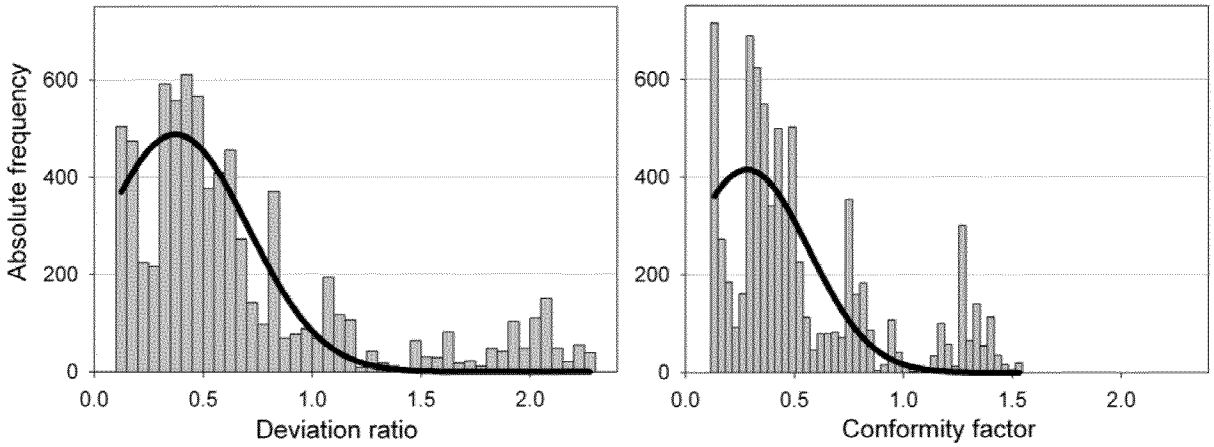

Figure 34: Cumulative frequency distribution of averaging window NO_X emissions of Vehicle L on test Route 1 expressed as deviation ration and conformity factor

On-road emissions testing with PEMS allows covering a large variety of driving conditions and is typically characterized by a high degree of randomness and limited repeatability. The variability in road, weather, and traffic conditions as well as the drivers' behaviour attribute to every on-road PEMS test quasi unique characteristics. Nevertheless, these characteristics open the possibility for limiting on-road PEMS tests to a very narrow range of normal driving conditions, e.g., with the aim of achieving extremely low emission values. Given this limitation, it is imperative:

(i) to continue using a standardized laboratory emissions test procedure that yields comparable and reproducible emission results

(ii) to supplement this procedure by test procedures that capture a wider range of potential on-road emissions

(iii) to define general criteria for conducting on-road PEMS tests

VW FOIA, EPA 06/20/2017 2017-FFP_027171

5.2 Potentials of PEMS-based emission test procedures

The present test campaign revealed the strengths and weaknesses of PEMS. In view of developing supplementary emission test procedures for light-duty vehicles, these can be summarized as follows:

Strengths:

(i) PEMS measures real emissions from actual on-road driving.

(ii) PEMS can assure the proper design and operation of emission control technologies as well as the vehicle's energy consumption under a wide variety of normal operating conditions.

(iii) PEMS is suitable to test emissions from novel engine/after-treatment/powertrain technologies (e.g., parallel/serial (plug-in) hybrids or electric vehicles) as well as from alternative fuels.

(iv) PEMS provides measurements that can serve as basis for not-to-exceed emission limits, i.e., emission levels that should not be exceeded, regardless of driving and ambient conditions.

Weaknesses:

(i) PEMS generally allow only to a very limited extent to reproduce and compare individual test results due to the variability of on-road ambient and driving conditions.

(ii) PEMS allow only to a limited extent to reproduce cold start emissions.

(iii) The power consumption of PEMS is typically supplied by auxiliary batteries in order not to interfere with the vehicle operation. However, the weight of batteries and analytical equipment of approximately 80 kg may introduce a bias in emission measurements, especially if conducted for small vehicles equipped with small engines. Potentials for weight reductions of the equipment exist as technological improvements of the test equipment are very likely (both in terms modularity and size).

Several practical considerations might support or limit the application of PEMS:

(i) PEMS allows for relatively long test campaigns of 2 hours duration.

(ii) PEMS test procedures and equipment has been developed for testing the in-service conformity of heavy-duty vehicles and non-road machinery and has been proven to be reliable also for light-duty vehicles.

(iii) The modular composition of PEMS allows for limiting the emissions screening to an absolute minimum. For instance, the THC measurements with an FID analyser (which has high power consumption and requires a hydrogen/helium mixture) could be abolished because the correct functioning of oxidation and three-way catalysts can also be verified by analysing CO emissions only. Such an approach would reduce the weigh of the PEMS equipment substantially.

(iv) PEMS testing requires no detailed prescription of driving and ambient conditions; a prescription of key-features of test routes (e.g., percentage of driving in city, motorway, test duration, road slope, drivers' behaviour) is, nevertheless, recommended to assure that PEMS testing covers as far as possible the large spectrum of driving conditions as it occurs during normal conditions of vehicle use.

VW FOIA, EPA 06/20/2017 2017-FFP_027172

6 Conclusions

This report analyzes the on-road emissions of twelve light-duty diesel and gasoline vehicles by using Portable Emission Measurement Systems (PEMS). The analyses were conducted for Euro 3-5 light-duty vehicles in the period between 2007 and 2010 on four test routes comprising rural, urban, uphill/downhill, and motorway driving.

The average NO_X emissions of all tested diesel vehicles over the entire test routes amount to 0.93 ± 0.39 g/km; the average NO_X emissions of the tested Euro 5 diesel vehicles reach 0.62 ± 0.19 g/km. These results indicate that NO_X emissions of light-duty diesel vehicles substantially exceed the Euro 3-5 emission limits: by a factor of 4-7 as averages over entire test routes and up to a factor of 14 for individual averaging windows. The increasing stringency of European emission limits has, thus, not resulted in an equivalent reduction of on-road NO_X emissions of light-duty diesel vehicles. By comparison, on-road NO_X emissions of gasoline vehicles as well as CO and THC emissions of diesel and gasoline vehicles generally stay within Euro 3-5 emission limits. The share of NO_2 in the total NO_X emissions reaches 60% for diesel vehicles but only 0-30% for gasoline vehicles. The tested light-duty diesel and gasoline vehicles emit on average 189 ± 51 g CO_2/km (grams of carbon dioxide per kilometre) and 162 ± 29 g CO_2/km, respectively during on-road testing, thereby exceeding the CO_2 levels as specified during NEDC testing of the respective vehicles by on average 21 ± 9%. The magnitude of all pollutant emissions varies depending on vehicle, operation mode, route characteristics, and ambient conditions. Cold-start emissions of both diesel and gasoline vehicles span over a large value range; NO_X emissions exceed Euro 3-5 emission limits by a factor 2-14, CO emissions often exceed the Euro 3-5 limits, and THC emissions are both below and above the limits.

In conclusion, the PEMS results indicate that on-road NO_X emissions of light-duty diesel vehicles differ substantially between laboratory NEDC testing and actual on-road driving. While the standardized laboratory NEDC emissions testing yields comparable and reproducible results, the procedure may fail to capture the potential range of on-road emissions. To solve this shortcoming, Regulation 715/2007 (EC, 2007a) envisages supplementing the standard laboratory emissions testing with suitable complementary test procedures. Such complementary procedures may then also address particularly polluting driving modes, which cannot be simulated in the laboratory such as (i) extreme high speed driving as it frequently occurs on the German Autobahn and (ii) vehicle operations associated with relatively low or high temperatures of the aftertreatment systems. Without covering such a wide range of normal operating conditions, a reduction of on-road emissions, and specifically NO_X emissions, may remain punctual.

The PEMS equipment is able to provide reliable and accurate on-road emission measurements for light-duty vehicles, even for vehicles that will be certified according to future emissions standards. This makes PEMS a suitable tool for identifying and updating emission factors of air pollution models. Furthermore, PEMS may be used as supplemental emission test procedure next to standardized laboratory emission tests. The strengths of PEMS include the ability to detect the proper operation of emission control technologies under a wide variety of normal operating conditions, in particular during high-speed driving at speeds above130 km/h as it frequently occurs on the German Autobahn. PEMS also allows testing emissions from novel fuel/engine/after-treatment/powertrain technologies (e.g., parallel/serial (plug-in) hybrid vehicles. Such analyses have not been conducted yet but are envisaged for the future. A major limitation of PEMS refers to its relatively high weight (PEMS unit, EFM, mounting devices, power supply), which may reach 80 kg

VW FOIA, EPA 06/20/2017 2017-FFP_027173

(i.e., equal to 1 person). As technological improvements of the test equipment are very likely (in terms modularity and size) the weight of the equipment could be reduced substantially in the future. In conclusion, the present test campaign has resulted in the successful application of PEMS for light-duty vehicles. The results of this test campaign indicate that on-road emissions might exceed substantially emission levels as identified during type approval in the laboratory.

The applied averaging window method, which has been implemented to check emissions of heavy-duty engines (EC, 2010), offers a simple and straightforward way to average and analyze emissions data of light-duty vehicles. Based on this method, appropriate indicators could be developed to evaluate whether an averaging window (or any other data sub-set) can be classified as extreme (as opposed to normal) driving conditions. Such analysis could address specific driving situations, for instance cold start, steep road grades, or aggressive high-speed driving.

Future research should address not-to-exceed regulatory concepts and alternative metrics for defining emission limits: the current approach that expresses emission limits as distance-specific quantities is problematic because it lacks a reference to actual engine parameters and only insufficiently accounts for the large variability of on-road driving conditions that may include long idling periods in congested traffic.

THE INTERNATIONAL COUNCIL ON CLEAN TRANSPORTATION

BRIEFING

MARCH 2015

Accelerating progress from Euro 4/IV to Euro 6/VI vehicle emissions standards

This brief presents the technical details and benefits of leapfrogging to Euro VI heavy-duty emission standards and Euro 6 light-duty emission standards rather than progressing through Euro 5/V.

INTRODUCTION

As many countries model their vehicle emission standards after those developed for the EU, the lessons learned in the European market should inform policymakers and manufacturers in other markets. This means acknowledging both the successes of these policies in leading to highly efficient control technology, and some of the failings in intermediate policy stages. Since the adoption of Euro 5/V standards across the EU, several shortcomings of the regulation have been revealed. For heavy-duty vehicles, Euro V standards have not achieved hoped-for reductions for NO_x emissions.[1] While Euro 5 standards have resulted in dramatic reductions in PM emissions from light-duty diesels, real-world diesel NO_x emissions have continued to far exceed certification limits.[2] Regulators should weigh these regulatory weaknesses when considering whether to move directly to Euro 6 and VI or to include the intermediate stages.

The type-approval process is critical in ensuring that reductions in limit values translate into reductions in real-world emissions from light- and heavy-duty vehicles. The type-approval

VW FOIA, EPA 06/20/2017 2017-FFP_027181

process specified for both Euro IV and V standards does not ensure that NO_x controls operate effectively in urban driving conditions. The issue has been addressed through the move to World Harmonized Test Cycles and efforts to improve real-world conformity to NO_x limits in Euro VI.[3] For light-duty vehicles, the current type-approval procedure (New European Driving Cycle or NEDC) allows certification of vehicles with real-world NO_x emissions far above regulatory limits,[4],[5] a problem that will be partly addressed in the Real-World Driving Emissions (RDE) provision of Euro 6c and the transition from the NEDC to the World-Harmonized Light-Duty Test Procedure (WLTP).[6] While Euro 5 standards have forced use of diesel particulate filters (DPFs) for light-duty diesels, only the Euro VI standard introduces a particle number (PN) limit for heavy-duty vehicles, leading to the use of diesel particulate filters (DPFs) for all diesel vehicles. Given the regulatory improvements that Euro 6/VI standards provide, countries following emission standards modeled after European regulations should move directly from Euro 4/IV to Euro 6/VI standards.

EURO VI HEAVY-DUTY VEHICLE STANDARDS

Euro VI is a critical step in heavy-duty emission standards, resulting in significant real-world reductions for both NO_x and PM emissions. Euro VI lowers both NO_x and PM limits and introduces a limit on particle number which leads to the use of a DPF for heavy-duty diesel vehicles. The standard also overhauls the testing procedures to better represent real-world driving conditions, broadens the set of pollutants considered, and strengthens durability and OBD requirements.

In the EU, Euro VI standards were implemented for all new vehicle registrations in January 2014,[7] with some provisions to be phased in by 2017.[8] To allow early introduction of lower-emitting vehicles, Euro VI type approvals were granted starting in August 2009. EU member states used tax incentives to encourage the sale of Euro VI certified vehicles before full implementation of the standards.[9] The same technology packages being used to comply with Euro VI standards have been necessary to comply with US standards since 2010.

FILTER-BASED PM CONTROLS FOR DIESELS

Euro VI standards lower the limit on PM emissions by 67% relative to Euro IV and V,[10] and introduce a particle number limit making a diesel particulate filter (DPF) the most cost-effective solution to meet emission requirements. Due to the high efficiency of DPFs at capturing PM, this results in a 90% drop in PM emissions[11] and >99% reduction in the number of ultrafine particles.[12] DPFs have been used to meet PM standards for heavy-

duty vehicles sold in the US since 2007, and have proven highly effective at reducing PM mass, ultrafine particles, and air toxics, as well as black carbon, a potent short-lived climate pollutant.[13],[14] Experiments investigating the health impacts of diesel exhaust that has passed through a DPF have found no evidence of cancer-causing effects, in contrast to unfiltered diesel exhaust.[15] By ensuring the use of DPFs, Euro VI provides much stronger air quality and health benefits than Euro V.

LIMITS ON PARTICLE NUMBER IN ADDITION TO MASS LIMITS

In addition to the more stringent limit on PM mass, Euro VI includes a limit on particle number, the measure of the number of individual particles emitted, and defines a new measurement procedure based on the work of the Particulate Measurement Programme (PMP) of the United Nations Economic Commission for Europe (UNECE).[16] The addition of the PN metric draws attention to emissions of ultrafine particles (less than 100 nanometers in diameter). Although ultrafine particles contribute little to the total PM mass, they are the dominant contributor to particle number. Because ultrafines can be inhaled more deeply into the lung, they are suspected of having greater toxicity than larger particles.[17] Wall-flow DPFs used on Euro VI engines reduce particle number emissions by >99%.[18]

REDUCED NO_x EMISSIONS

While Euro VI standards reduce the limit on NO_x emissions by 77% relative to Euro V, and by 89% relative to Euro IV, advanced test protocols that improve real-world conformity to NO_x limits result in real reductions that are closer to 95% relative to Euro V.[19] NO_x reductions are achieved with combustion improvements (high-pressure fuel injection and advanced air/fuel management), exhaust gas recirculation, and a closed-loop selective catalytic reduction (SCR) system. Euro VI vehicles are required to be certified under lower loads, lower speeds, and cold start conditions, ensuring that emission control systems are calibrated to function during the full range of driving conditions.

Real-world emissions data has shown that NO_x emissions from Euro V trucks and buses greatly exceed their certified limit values.[20],[21] Low speed driving forms a major component of vehicle use in countries such as India. Euro VI addresses the Euro V problem of under-emphasizing high NO_x emissions at the low-speed, low-load driving conditions typical of urban areas with test cycles that better represent real-world driving conditions. Euro VI standards replace the European Transient Cycle (ETC) and Stationary Cycle (ESC) with the World Harmonized Transient Cycle (WHTC) and Steady-State Cycle (WHSC). The WHTC requires both cold and hot start conditions and includes more

than twice the idling time as the ETC. Similarly, the WHSC includes an average engine load about half that of the ESC. Euro VI also introduced off-cycle emissions testing requirements that follow the not-to-exceed (NTE) limit approach used in the US. Testing of Euro IV, V, and VI certified engines on six non-regulatory, real-world duty cycles found that Euro VI certified vehicles consistently conformed to regulatory limits, unlike Euro IV and V certified vehicles which have average emissions approximately two and five times higher than their respective certification levels.[22]

The benefits of NO_X reduction for air quality include reduced formation of secondary $PM_{2.5}$ and ground-level ozone, as well as lower direct NO_2 emissions. Possible complementary provisions to Euro VI may include in the future a maximum limit for the NO_2 component of NO_X.

IN-SERVICE CONFORMITY TESTING FOR TYPE APPROVAL AND IN-SERVICE VEHICLES

In addition to the changes in laboratory testing, Euro VI importantly introduces in-service conformity (ISC) testing requirements using a Portable Emission Measurement System (PEMS).[23] Although this complements the test-cycle changes in ensuring conformity to NO_X emissions limits, it has emerged as one of the most important new aspects of the Euro VI regulation. The first ISC test must occur within 18 months of type approval, and the vehicle model must be tested at least once every two years.[24] Testing includes a mix of urban, rural, and highway driving, and tracks emissions of carbon monoxide, total hydrocarbons, CO_2, NO_X for diesel engines and methane for gas engines. In-service conformity has been enforced by previous standards, but this provision marks the first time that in-use testing is included in European vehicle emission standards, and ensures conformity to the Euro VI regulations.

NEW AMMONIA LIMIT

Euro VI introduces a new limit on ammonia (NH_3) emissions.[25] The selective catalytic reduction (SCR) systems used to control NO_X emissions in Euro IV-VI may produce excess ammonia as a byproduct (ammonia slip). The limit requires precise control of urea injection and tuning of the SCR system to prevent excess NH_3 and may also require the use of a guard catalyst installed downstream of the SCR (ammonia slip catalyst). Because ammonia emissions lead to the formation of secondary PM, controlling ammonia can improve air quality[26] as well as preventing the harmful environmental effects of ammonia deposition in water.[27] Ammonia is also harmful if inhaled directly.[28]

TIGHTER, WIDER-REACHING CONTROL ON METHANE

Euro VI tightens methane limits for CNG vehicles by 50% and imposes the same limit on LPG vehicles. Methane is a potent greenhouse gas[29] and can contribute to ground-

level ozone formation. Controlling emissions from alternative-fuel vehicles is increasingly important in regions where their market share is expected to grow.

EXTENDED DURABILITY REQUIREMENTS

Euro VI increases the durability distance requirement for all vehicle categories, but allows the same year period requirement as Euro IV and V. It requires durability of 160,000 km or 5 years (whichever occurs sooner) for small buses and pick-up trucks[30] compared to 100,000 km under Euro V; durability of 300,000 km or 6 years for mid-size trucks and buses[31] compared to 200,000 km under Euro V; and 700,000 km and 7 years for heavy trucks and buses[32] compared to 500,000 km under Euro V. Higher durability requirements in Euro VI ensure that emissions stay low throughout the useful life of the vehicle. Ensuring that the emissions control equipment is functioning through the most productive lifetime is especially critical for long-lived and intensively-used diesel vehicles.

IMPROVEMENTS IN OBD SYSTEMS

On-Board Diagnostic (OBD) systems for heavy-duty vehicles are increasingly important as more sophisticated in-cylinder controls and aftertreatment systems are added to vehicles. In addition to inducements to ensure proper operation, including torque limits when NO_x emissions exceed a threshold of 7.0 g/km or the system detects insufficient urea levels or quality, Euro IV standard introduced the first requirements for OBD monitoring of NO_x control systems. With Euro VI standards, OBD systems are also required to monitor the performance of the fuel injection system, exhaust gas recirculation (EGR) system, DPF, and any other emission related component.[33] They are also required to issue warnings for unexpected levels of urea consumption, and impose more severe inducements when urea level or quality is not sufficient for proper SCR performance. OBD threshold limits (OTLs), which if exceeded will signal a fault, are 82% lower for NO_x and 75% lower for PM with respect to Euro IV and Euro V OTLs. Finally, Euro VI requires improved communication procedures for OBD systems and requires improved access to OBD data for vehicle repair and maintenance.

EURO 6 LIGHT DUTY VEHICLE STANDARDS

Euro 6 standards narrow the gap between diesel and gasoline light-duty vehicle standards and strengthen OBD requirements. Some of the biggest changes to come with Euro 6, real-word driving testing and the introduction of new test cycle procedures, are almost finalized and are expected to be fully implemented within the 2017-2020 timeframe.

In the EU, Euro 6 is being introduced in three stages. Vehicles that were certified to meet Euro 6 limits ahead of the September 2015 regulatory deadline were allowed relaxed OBD requirements and no particle number limit for gasoline vehicles (the 6a stage). After September 2015,[34] all new-vehicle registrations must meet Euro 6 standards, including full Euro 6 OBD requirements but with preliminary OBD threshold limits and a relaxed PN limit for DI gasoline vehicles (the 6b stage). After three years of Euro 6 implementation,

30 N1 and M2 vehicle categories
31 N2; N3 ≤ 16 ton; and M3 Class I, Class II, Class A, and Class B ≤ 7.5 ton
32 N3 > 16 ton; M3 Class III, and Class B > 7.5 ton
33 Posada, F., and Bandivadekar, A. (2015). Global overview of on-board diagnostic (OBD) systems for heavy-duty vehicles. The International Council on Clean Transportation. Retrieved from http://www.theicct.org/global-overview-board-diagnostic-obd-systems-heavy-duty-vehicles
34 September 2015 is the implementation date for all new registrations of passenger cars (category M1) and light commercial vehicles (category N1, class I). The implementation for new type approvals occurs a year earlier, in September 2014. For heavier commercial vehicles (category N1 class II and III, category N2), Euro 6 will come into effect for new type approvals in September 2015, and apply to all new registrations in September 2016.

VW FOIA, EPA 06/20/2017 2017-FFP_027185

or after September 2018[35] for all new registrations, the stricter PN emission limit (equal to the diesel limit introduced with Euro 5b) becomes mandatory for all gasoline vehicles, final OBD threshold limits will be enforced, and real world driving emissions (RDE) requirements will be introduced (stage Euro 6c). As a final component of Euro 6c, the Worldwide harmonized Light vehicles Test Cycles (WLTC) will be adopted in place of the current New European Driving Cycle (NEDC). The timing of the WLTC adoption is not yet determined, but it is likely to happen in 2017–2020. No change in the Euro 6c regulated pollutants limits is expected with the introduction of WLTP, only the CO_2 targets.

LIMITS ON PARTICLE NUMBER FOR ALL FUEL TYPES

Limits on particle number (PN), important for controlling ultrafine particle emissions, were introduced in Euro 5b for compression-ignition vehicles.[36] While these PN limits applied to all light-duty diesel vehicles, they did not apply to the increasingly popular gasoline direct-injection (GDI) technology, which generates more particles than traditional port-fuel gasoline engines.[37] Euro 6c requires all vehicles to meet uniform PN standards, including those with spark-ignition GDI engines.[38] It is expected that GDI vehicles will meet PN standards with relatively low-cost gasoline particulate filters, estimated to cost less than USD$100.[39]

TIGHTER LIMITS FOR DIESELS NARROWS THE GAP BETWEEN FUEL TYPES

Euro 6 tightens the diesel NO_x standard by 55% with respect to Euro 5, and tightens the HC+NO_x standard by 26%–39% depending on vehicle type.[40] This partially addresses the long-standing issue that European emission standards are not fuel-neutral. Even under the Euro 4 standards, NO_x limit values for diesel vehicles were three times the limit values for gasoline vehicles. With Euro 6, NO_x emission limits for diesel vehicles are only 25% higher than for gasoline vehicles, a smaller margin than in any previous standard. With the use of DPFs to meet Euro 5 PM and PN limits, particulate emissions from diesel cars also approach those of gasoline cars. Euro 6 limits bring overall emissions of diesel and gasoline vehicles close to parity, provided that vehicles of both fuel types conform to standards in real-world driving conditions.

REAL-WORLD DRIVING TESTING

As with the Euro VI in-service conformity standards for heavy-duty vehicles, real driving emissions (RDE) testing will be included as an additional requirement for type approval in the final stage of Euro 6. Portable Emission Measurement System (PEMS) testing of early Euro 6-certified diesel vehicles has revealed that NO_x emission control systems that are sufficient to pass laboratory-based emissions tests may not operate at certified levels in real world driving conditions, with real-driving NO_x emissions three to six times those indicated by certification testing.[41] With RDE provisions, vehicle emissions of CO, NOx, and PN will be measured on the road using PEMS testing to ensure that emissions during real-world driving stay within reasonable limits. RDE testing will begin with a pilot

phase from 2015 through 2017. No limits will be enforced during this monitoring phase. An initial conformity factor will be set in 2015; the Euro 6 limit values will be multiplied by this conformity factor to determine the limits for RDE testing. In 2017, RDE testing against this conformity factor will begin. Conformity factors will be defined for NO_x and PN; they may be tightened in the future.

LOWER OBD THRESHOLDS

The On-Board Diagnostic (OBD) thresholds (OTLs) for Euro 6 are 70-75% lower than Euro 5 OTLs for NO_x and PM, depending on vehicle type, and about 10% lower for carbon monoxide (CO) and non-methane hydrocarbons (NMHC).[42] This means the OBD system is sensitive to more minor malfunctions in the emission control system, leading to earlier detection and corrections of such problems.

PLANNED MOVE TO A HARMONIZED TEST CYCLE

With full implementation of Euro 6, the World Harmonized Light Vehicles Test Procedure (WLTP) will replace the current test procedure. Under the new protocol, the World Harmonized Light-duty Vehicle Test Cycle (WLTC) will replace the New European Drive Cycle (NEDC), and a variety of test parameters will be adjusted to close loopholes and address shortcomings of the NEDC procedure.[43] The WLTC is more representative of real-world driving conditions than the NEDC[44], and will be complemented by the RDE testing efforts to ensure better conformity to standards in real driving conditions. The WLTP has other benefits for vehicle efficiency testing, and the use of a harmonized test will save auto manufacturers in development and certification costs.

CONCLUSION

Given the availability of ultra-low sulfur fuel (sulfur content less than 10 ppm), greater air-quality benefits can be gained from a leap from Euro 4/IV to Euro 6/VI than a path that includes the intermediate Euro5/V stage. For countries that are at prior standards for heavy-duty vehicles, skipping Euro IV and V altogether may also be an attractive option. Accelerating the adoption of heavy-duty vehicle Euro VI standards has two-fold benefits for air quality: the use of DPFs to comply with new PM and PN leads to a 90% or greater reduction of $PM_{2.5}$ emissions, and the new test cycle and in-service conformity requirements provide real-world reductions in NO_x emissions of 95% or greater, providing emission control even in urban driving conditions that remained a problem in Euro V. Light-duty Euro 6 standards promise a similar reduction in real-world NO_x emissions from diesel cars, through tighter emissions limits, a future move to the WLTP, and the inclusion of PEMS testing in the type approval process to ensure conformity to standards in actual driving conditions. Countries like India are poised to take full advantage of the mature, effective control technologies now available by skipping Euro 5/V and moving directly to Euro 6/VI.

Subject: Invitation to Speak at a December Webinar
removed.txt

Hi Phil-

I trust you and your family are doing well and enjoyed a wonderful summer!

I've been asked to put together a panel for a webinar entitled "Environmental Regulatory Compliance: What to Expect". The tentative presentation date is 12/9/2015 from 2-3 pm Eastern. The webinar will be a 45-minute presentation with slides followed by a 15-minute Q&A. The audience generally will be environmental managers from domestic companies as well as international companies with U.S. facilities or transactions. The panel will consist of three experts on criminal enforcement, civil enforcement, and compliance, respectively. I hope each panelist will speak for no more than 15 minutes.

With OCE, as always, a vital part of EPA's enforcement program, I'd greatly appreciate if you could discuss recent litigation and highlight why the case is particularly important. VW is certainly has everyone's attention at this point! In addition, we hope you can discuss FY 2016-2017 enforcement initiatives and priorities as well as key rulemakings. A lot to ask for in less than 20 minutes.

I look forward to hearing from you. Please call me if you have any questions.

With best regards,

Jon

AN E&E PUBLISHING SERVICE

AIR POLLUTION:

Ex-Volkswagen CEO facing criminal probe

Sean Reilly, E&E reporter

Published: Monday, September 28, 2015

German prosecutors have opened a preliminary investigation into any role that Martin Winterkorn, former chief executive officer of Volkswagen AG, may have had in an emissions cheating scheme affecting millions of diesel-powered vehicles.

The inquiry will focus on who bears responsibility for rigging the cars to evade testing requirements, according to a **news release** today from the prosecutor's office in the central German city of Braunschweig, not far from Volkswagen AG's corporate headquarters in Wolfsburg.

While VW's board had said last week that it was voluntarily requesting an investigation, Julia Meyer, a spokeswoman for the prosecutor's office, told the Associated Press that about a dozen complaints had been received in all. She would not predict how long the probe might last.

Winterkorn resigned Wednesday, five days after U.S. EPA and California state regulators accused the automaker of installing software on almost a half-million VW and Audi cars that applied full emissions controls when the vehicles were being tested but otherwise left them free to spew nitrogen oxides at up to 40 times the allowable levels.

In his resignation statement, Winterkorn, who had headed the Volkswagen Group since 2007, said he knew of no wrongdoing on his part but accepted responsibility for the "irregularities" (***Greenwire***, Sept. 23).

The company, which on Friday named Matthias Mueller, chairman of its Porsche unit, as Winterkorn's replacement, had no immediate comment today on the news of the investigation.

Worldwide, the scam affects some 11 million vehicles, the company has said. In the United States alone, VW could face up to $18 billion in fines. In a sign that the fallout is spreading throughout the industry, EPA managers Friday warned all automakers that their cars could be tested under real-world driving conditions for the "defeat devices" (***Greenwire***, Sept. 25).

But the episode is also giving fresh wind to EPA critics who see the existing testing framework as overly deferential to car and truck manufactures. Volkswagen's deception, which has been going on for years, was uncovered by West Virginia University researchers working for the International Council on

Clean Transportation, an independent nonprofit.

In a news release today, Public Employees for Environmental Responsibility (PEER), a watchdog organization, accused EPA of failing to use actual "on the road" emissions data collected from diesel vehicles to monitor either emissions or fuel efficiency.

Currently, testing is conducted "by putting the vehicle on a dynamometer -- essentially a big treadmill," PEER said in the release. When heavy-duty diesel engine manufacturers in the late 1990s were found to have resorted to the same type of manipulation used by Volkswagen, they instead agreed to "in-use" testing to show compliance, the group said.

But EPA has refused to make the data from that testing program public on the grounds that it is "confidential business information," the group said, and has also invested $50 million in a new chassis dynamometer for light-duty vehicles to be rolled out next month.

The Volkswagen scandal shows that dynamometer technology "is a dinosaur, yet EPA [keeps] pouring money into it," Jeff Ruch, PEER's executive director, said in the release. "The fact that the VW cheating was revealed by outsiders indicates the clubby and closed manner in which this arm of EPA operates."

In an emailed response, EPA spokesman Nick Conger called many of PEER's points "simply wrong." The agency uses a wide range of tools besides dynamometers "that are all critical to the ... overall compliance program," Conger said. They include on-road testing, audits of industry emissions testing labs and "selective enforcement" reviews where vehicles and engines are pulled at random from an assembly line and tested. EPA also "continually updates its oversight strategies, and adapts when we learn of ways that manufacturers can game the system," Conger said. "That is part of any oversight effort."

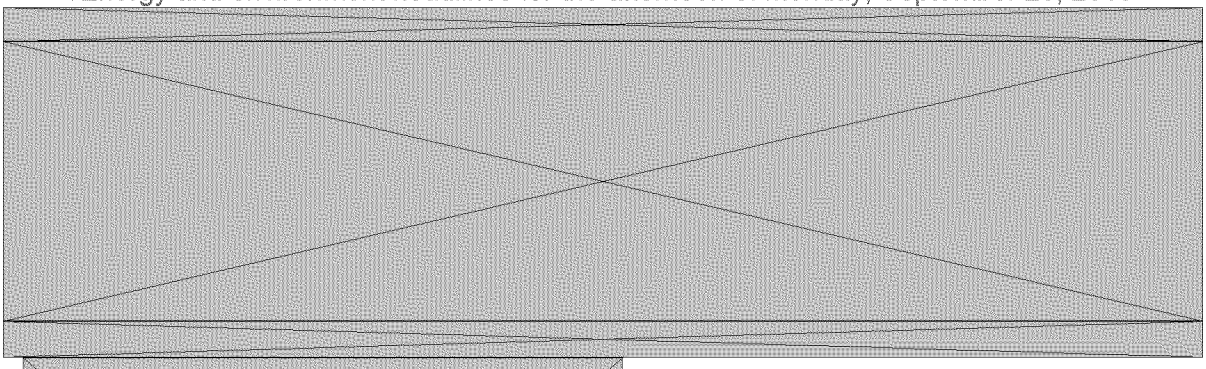
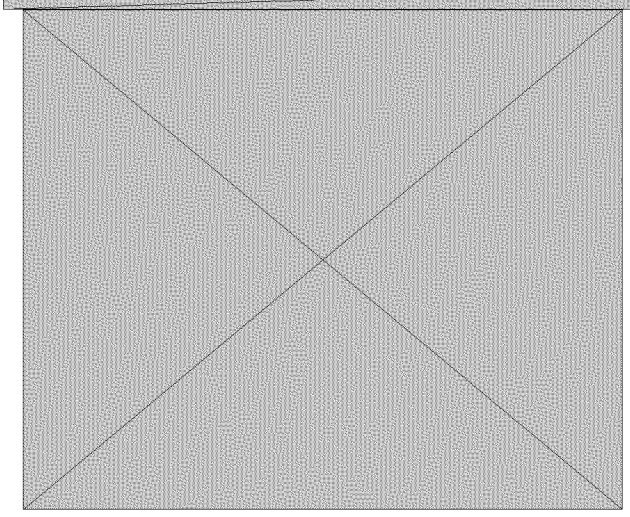
Energy and environment headlines for the afternoon of Monday, September 28, 2015





Alaska Republicans pin Shell's Arctic withdrawal on Obama

By Kevin Rogers

Alaska's Republican senators on Monday blamed the Obama administration for creating a "burdensome and often contradictory regulatory environment" that drove Royal Dutch Shell to abandon its oil and gas exploration off the coast of Alaska.

Shell, citing a "clearly disappointing exploration outcome" and a "challenging and unpredictable federal regulatory environment," said Monday it would cease its operations in

the Chukchi Sea "for the foreseeable future" after an investment of seven years and $7 billion.

Shell's announcement came as oil continued to hover below $50 a barrel, significantly lower than when the company decided to explore for oil in the forbidding waters off Alaska.

Energy and Natural Resources Committee Chairman Sen. Lisa Murkowski, R-Alaska, and Sen. Dan Sullivan, R-Alaska, said that the administration had doomed the project from the start, and called on the Interior Department to develop a "legitimate plan" for Alaskan energy development.

"Interior placed significant limits on this season's activities, which resulted in a drilling rig sitting idle, and is widely expected to issue additional regulations in the coming weeks that will make it even harder to drill," Murkowski said in a statement. "Add this all up, and it is clear that the federal regulatory environment – uncertain, ever changing, and continuing to deteriorate – was a significant factor in Shell's decision."

Shell's efforts in the Arctic have been plagued with difficulty. Its previous drilling season, in 2012, ended with one of its drill ships, the Kulluk, running aground off the coast of Alaska during a storm. The National Transportation Safety Board, in a report in May, knocked the company for underestimating the weather's potential risks on towing operations.

The Interior Department has proposed Arctic-specific rules for drilling that would require companies to have backup relief rigs in place and require operation and oil spill response plans tailored to the region. Still in the proposal stage, those rules didn't apply to Shell's program.

Sullivan lamented Shell's decision as a "sad day for Alaska."

"From the beginning, through unprecedented regulatory hurdles and delays, the Obama administration and its environmental allies have created the conditions for Shell to abandon its Arctic drilling program. And they succeeded," he said.

Brad Townsend, the associate director for energy innovation at the Bipartisan Policy Center, said the current low-price environment for oil likely played a significant factor in Shell's decision.

"Drilling in the Arctic is already an expensive proposition," he said. "It's not surprising that they've pulled back, given the current prices."

The senators warned that allowing U.S. drilling efforts to decline would open the door for Russia, China and other competitors, who would offer fewer environmental protections.

"I personally believe that America should lead the way," Murkowski said.

Interior Press Secretary Jessica Kershaw wouldn't comment on the lawmakers' remarks, but

defended the department's strong safety standards for Shell's program.

"The Department of the Interior has focused on making sure that Shell's exploration activities are performed as safely as possible," she said. "To that end, Interior has set the highest safety standards on offshore drilling off the Alaska coast – with requirements tailored specifically to the conditions and risks of drilling in this area."

Shell first obtained a lease to drill in the Chukchi's Burger Prospect in 2008, though its progress toward exploration was slowed by legal challenges to the leasing process. The Obama administration affirmed that sale in March and granted Shell its final permit in August.

Alaska Gov. Bill Walker, an independent, called Shell's decision to cease operations "a really big disappointment," but he said it highlighted the need for Alaska to take a more proactive role in development of existing resources.

"This was a tough day. A very tough day for Shell and a very tough day for Alaska," he told reporters on a call. "I try to turn these difficult days into opportunities, and that's exactly what we're going to do in this situation."

Walker said he would meet with Interior Secretary Sally Jewell on the issue "as soon as possible." He also said he has asked the White House for a meeting on offshore and onshore development.

While Shell will retain the rights to its Chukchi Sea acreage, it will now move to seal the well and remove its equipment from the region.

Environmentalists and allies in Congress hailed Monday's developments. They had slammed the Obama administration's decision to allow Shell's program to advance, and now they were urging the president to block future Arctic development.

"Today, President Obama can also make history by canceling any future drilling and declaring the U.S. Arctic Ocean off limits to oil companies," Greenpeace USA Executive Director Annie Leonard said in a statement.

Sen. Ed Markey, D-Mass., said he would continue to press Congress to block Arctic drilling.

"At a time when the oil industry is warehousing tens of millions of acres of leases on public land that it already holds and is arguing that we need to allow American oil to be exported overseas, there is no justification for continuing to push to drill offshore in Alaska," he said in a statement.

Upcoming Events

EPA rules will strengthen pesticide safety on farms

By Mary Clare Jalonick

WASHINGTON (AP) — The Environmental Protection Agency is strengthening 20-year-old rules designed to protect farmworkers from toxic pesticides.

New rules announced by the EPA on Monday will bar almost anyone under 18 from handling pesticides and require buffer zones around fields to protect workers from drift and fumes. Farm owners and their immediate families would be exempt from the rules.

Under the new standards, workers would have to be trained annually on pesticide risk. Currently they only have to be trained every five years. Farms would also be required to post no-entry signs when the most toxic pesticides are applied.

EPA Administrator Gina McCarthy said the rules are "a long time coming" and would affect millions of agricultural workers across the country.

More

German prosecutors investigate former VW boss

By Geir Moulson and David Rising

BERLIN (AP) — German prosecutors on Monday opened an investigation against former Volkswagen CEO Martin Winterkorn to establish what his role was in the emissions-rigging scandal that has shaken the world's largest automaker.

The investigation will concentrate on the suspicion of fraud committed through the sale of vehicles with manipulated emissions data, and aims to determine who was responsible, prosecutors in Braunschweig said in a statement.

In the German system, anyone can file a criminal complaint with prosecutors, who are then obliged to examine it and decide whether there is enough evidence to open a formal investigation.

In this case, following the revelations about the rigged tests, prosecutors in Braunschweig, near VW's headquarters in Wolfsburg, received about a dozen complaints, including one from Volkswagen itself, said spokeswoman Julia Meyer.

Republican megadonor urges talk on climate change solutions

By Julie Bykowicz

WASHINGTON (AP) — Republican businessman Jay Faison says his party should stop fighting science and start talking solutions to climate change. He has $175 million in potential political donations to help inspire them. And if that's not enough, he's commissioned a survey, released Monday, that he says shows voters agree.

"I'm pretty frustrated about the political divide," Faison said. "This is too important to leave to the Democrats."

Faison made his fortune in 2013 with the sale of his majority stake in his audio-visual equipment company, based in Charlotte, North Carolina. He sank much of his profit into the ClearPath Foundation and a separate politically active policy group; both are devoted to moving Republicans beyond saying that the climate is not changing — or, if it is, that humans have nothing to do with it.

Instead, GOP leaders should be talking about solutions, such as clean energy, Faison said.

More

Despite pledges, climate action seen falling short

By Karl Ritter

STOCKHOLM (AP) — The emissions pledges that countries have made ahead of a landmark conference in Paris have been a major boost to the slow-moving U.N. effort to fight climate change.

Less so for the climate itself.

With pledges to cut or curb greenhouse gas pollution on the table from all major countries except India, researchers say the world is on track for more than 2 degrees C (4 F) of warming this century.

That's a level that scientists say could result in profound and irreversible impacts on the climate system, including flooding of coastal cities and island nations, disruptions to agriculture and drinking water, and the spread of diseases and the extinction of species.

Study: Sea level rise increasing major storms off New Jersey

By Wayne Parry

MANTOLOKING, N.J. (AP) — A new study looking back over 1,000 years finds the flooding risk along the New York and New Jersey coasts increased greatly after industrialization, and major storms that once might have occurred every 500 years could soon happen every 25 years or so.

The study by Penn State, Rutgers, Princeton, and Tufts universities, and Massachusetts Institute of Technology, finds that flood heights have risen nearly 4 feet since the year 850, largely because of a sea level rise. The study advocates better risk management strategies to cope with storms.

It was released a month before the third anniversary of Superstorm Sandy, which devastated the coasts of New York and New Jersey.

"A storm that occurred once in seven generations is now occurring twice in a generation," said Benjamin Horton of Rutgers, one of six lead researchers involved in the study. "What we do know is that as sea level rise accelerates into the future, we are going to have more frequent flooding."

U.S. drilling states guided on handling quakes

By Julie Carr Smyth

COLUMBUS, Ohio (AP) — A group of U.S. drilling states, seismologists, academics and industry experts issued guidance Monday in a frank new report on handling human-induced earthquakes caused by hydraulic fracturing or the disposal of fracking wastewater.

The 150-page report, produced by the StatesFirst initiative, represents perhaps the most candid discussion on the topic since tremors across the mid-continent — including in Oklahoma, Texas, Colorado and Ohio — began being linked to fracking and deep-injection wastewater disposal around 2009.

It includes descriptions of how states handled various seismic incidents around the country, including their public relations strategies, and matter-of-factly references links between

fracking or deep-injection wastewater disposal and earthquakes. Previously, public admissions had been fuzzy in some cases.

The group stopped short of suggesting model regulations, however.

Nature foundation unveils $3.3M in monarch butterfly grants

By Jim Suhr

KANSAS CITY, Mo. (AP) — A national wildlife group awarded $3.3 million in grants Monday in its initial push to stem the worrisome decline of monarch butterflies, hoping the effort helps restore as much as 33,000 acres of habitat for the black-and-orange insect.

The 22 grants announced by the National Fish and Wildlife Foundation will be matched by more than $6.7 million from the recipients, who are in more than a dozen states and among 115 applicants for funds in the conservation effort launched earlier this year.

"We were delighted to have drawn such a large number of excellent proposals," said Lila Helms, the foundation's executive vice president of external affairs. The grants "will fund on-the-ground projects that will quickly contribute to a healthier, more sustainable monarch population."

Many of Monday's biggest grants — roughly $250,000 apiece — went to efforts to bolster grasslands and other habitat in key monarch butterfly migration corridors. One project looks to restore more than 1,000 acres of monarch habitat in the Dakotas, while another includes the Iowa Natural Heritage Foundation's quest to create or improve 7,000 habitat acres along two of the butterfly's major north-south migration routes.

Alcoa splitting into 2 companies

By The Associated Press

NEW YORK (AP) — Alcoa will split into two independent companies, separating its bauxite, aluminum and casting operations from its engineering, transportation and global rolled products businesses.

The century-plus-old metals maker has been dealing with a downturn in its smelting business because of lower aluminum prices. The split will create one company focusing on upstream products, including aluminum. The other company will focus on engineered products, which

Sponsored Links

includes the automotive and aerospace segments.

The split is part of a wider movement by companies to spin off units in a bid to boost shareholder value. Often, the strategy helps free the stronger part of a company's business from a weaker segment.

The aluminum and upstream products company will retain the Alcoa name. The name of the engineered products company has yet to be determined.

Feds to release final bull trout recovery plan for 5 states

By Keith Ridler

BOISE, Idaho (AP) — Federal officials say they'll release their final plan Wednesday to recover struggling bull trout in five Western states with the goal of lifting Endangered Species Act protections.

The U.S. Fish and Wildlife Service says the Bull Trout Recovery Plan outlines conservation actions needed to boost populations in six recovery units spread over Idaho, Oregon, Washington, California and a tiny portion of northern Nevada.

Steve Duke, bull trout recovery planning coordinator for the agency, said the plan can be used by the U.S. Forest Service, U.S. Bureau of Land Management, Bonneville Power Administration, U.S. Bureau of Reclamation as well as other entities to guide conservation efforts.

"Beginning Wednesday, they'll know what the roadmap is for achieving recovery and fixing what's going on in their areas of recovery," Duke said. "I feel really good about what we've put out."

Kuwaiti oil minister rejects OPEC meeting nonmember nations

By The Associated Press

KUWAIT CITY (AP) — Kuwait's oil minister is rejecting the idea of a meeting between OPEC members and nonmember states as requested by financially struggling Venezuela.

Oil Minister Ali al-Omair made the comments Monday in remarks carried by the official

Kuwait News Agency. Al-Omair says since nonmember nations have no obligation to drop their production, an OPEC meeting with them wouldn't make any sense.

He says that "even after OPEC states commit to decreasing production, other states increase their production. This makes us lose market share and opportunities that are hard to compensate."

In Venezuela, where crude oil accounts for 95 percent of all exports, President Nicolas Maduro has urged OPEC to take action to stop oil's declining price, including meeting with nonmembers. But Saudi Arabia and other countries have kept up their production.

Subject: OAR Shout Out

Dear Colleagues,

By now I'm sure that many of you have seen the news about Volkswagen. This Shout Out goes to the teams in OTAQ, OECA, OGC, OCIR, OPA and our partners at the California Air Resources Board (CARB) who uncovered the problem and worked quickly to bring it to light. Together they showed the world that the United States takes our standards to protect public health very seriously.

Here's a quick summary of what happened. Late last week, the agency issued a "notice of violation" (NOV) of the Clean Air Act to Volkswagen. The NOV alleges that several four-cylinder Volkswagen and Audi diesel cars from model years 2009-2015 are equipped with software that disables the vehicles' emission controls, causing them to emit smog- and soot-forming nitrogen oxides (NOx) at up to 40 times higher than the amount EPA standards allow. The software is smart enough to run the pollution controls during an emissions test, but to shut them off under normal driving conditions. This is what the Clean Air Act calls a "defeat device," and it's illegal.

Tipped off by an independent study from last year, OTAQ and CARB dug deeper, conducted further testing, and started asking the company some important questions. Not until early this

month, after EPA and CARB demanded an explanation for the identified emission problems, did VW admit that the cars in question contained defeat devices.

After this admission, the OTAQ, OECA and CARB teams worked quickly to bring the facts as we knew them to public attention. This led up to last Friday's joint announcement by EPA and CARB.

Less than a week after that announcement, VW had divulged that the defeat device was installed in 11 million of its vehicles sold worldwide, the company's CEO had stepped down, and Germany's president called for an investigation and steps to ensure that this would never happen again.

I want to make clear that these cars are safe and legal to drive. OTAQ is providing information to motorists and will be working with Volkswagen to ensure the company implements a plan to fix these vehicles.

I also want to make clear that the headlines are not why we took action. As OTAQ Director Chris Grundler said to his team and OECA – "we showed, again, that EPA keeps its promises – that we are serious about securing the benefits we predict and promise the public will result from our standards." I couldn't say it any better.

And rest assured, our OTAQ compliance team is already taking steps to enhance our vehicle certification protocol to detect any future attempts at deploying this defeat device. So with that, this Shout Out goes to these folks across EPA and CARB (and we know additional staff will become involved in this over the coming months) - **OTAQ**: Byron Bunker, Janet Cohen, Linc Wehrly, Joel Ball, Jim Snyder, Holly Pugliese, Lee Cook, Ben Hengst, Erin Birgfeld, Tia Sutton, Jennifer France, Trish Suarez, Lisa Sun, David Levin, and Gwen Dietrich; **OECA**: John Senn, Rosemarie Kelley, Nick Conger, Phillip Brooks, Jacqueline Werner, Evan Belser, and Meetu Kaul; **OGC**: David Orlin and Mark Kataoka; **OPA**: Julia Valentine, Kristiene Gong, Jay Davis, Dan Abrams, and Laura Allen; and **OCIR:** Josh Lewis, Pat Haman, Caroline Emmerson, and Carolyn Levine.

See more information on the VW case on our website:
http://www3.epa.gov/otaq/cert/violations.htm.

Have a nice weekend everyone.

Janet

Dealers, Owners Feel Frustrated and Betrayed by VW Scandal
By GILLIAN FLACCUS AND TOM KRISHER, ASSOCIATED PRESS
LOS ANGELES — Sep 24, 2015, 8:38 AM ET
18 SHARES
Bob Rand bought his Volkswagen Passat last year for its clean emissions and high gas mileage. He liked the car so much he convinced his son and a friend to buy one, too.
Now, as Volkswagen comes clean about rigging diesel emissions to pass U.S. tests, Rand is desperately trying to sell the fully loaded model with white leather seats for $10,000 below what he paid. His sole bite has been from a man who offered $7,500 on speculation that he could resell it in Mexico.
"Volkswagen was somebody that you could rely on for cutting-edge products and quality and all those things and now you find out that they're not above lying just flat out," said Rand, who plans to join a class-action lawsuit against VW. "That's probably about as bad a thing as a company can do is lie to your face when you're buying a $35,000 car."
Rand's anger at the world's top-selling car company was echoed Wednesday by private dealers, auto wholesalers and owners across the U.S. as fallout from the smog test trickery mounted.
The U.S. Environmental Protection Agency first disclosed Friday that stealth software makes VW's 2009-2015 model cars powered by 2.0-liter diesel engines run cleaner during emissions tests than in actual driving. On Wednesday, Volkswagen CEO Martin Winterkorn resigned and took responsibility for the "irregularities" found by U.S. inspectors — a scandal that has wiped out billions in the company's market value and raised the possibility of

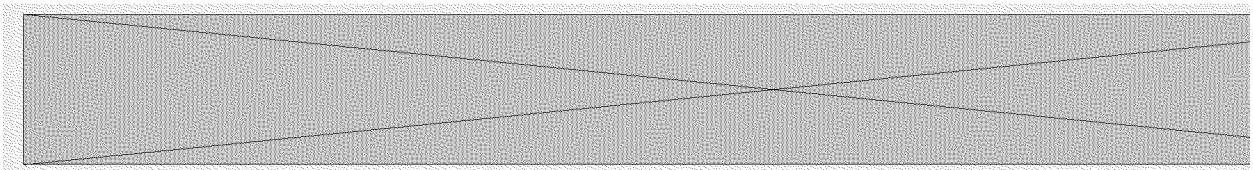
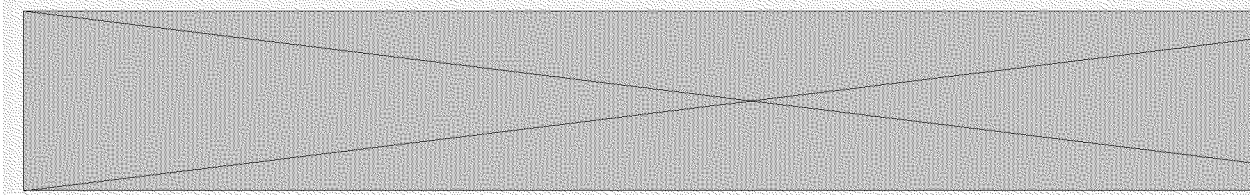
Subject: Overnight Energy & Environment: Shell abandons the Arctic





'SHELL NO,' INDEED: Royal Dutch Shell has abandoned plans to drill for oil in the Arctic Ocean "for the foreseeable future."

Cutting oil & gas methane makes cents. It creates quality manufacturing and service jobs, boosts America's small businesses and saves $1.2 billion in energy waste. Learn more www.EDF.org/methane

SPONSOR-GENERATED CONTENT

Green groups cheered the oil giant's decision on Monday, which came after more than a month of oil exploration in the Chukchi Sea. The company said it found some oil in its exploration well, but not enough to justify the deep costs associated with setting up further drilling operations there.

"Shell continues to see important exploration potential in the basin, and the area is likely to ultimately be of strategic importance to Alaska and the U.S.," Shell Upstream Americas Director Marvin Odum said in a statement.

"However, this is a clearly disappointing exploration outcome for this part of the basin."

Environmentalists, who had slammed Shell for pushing forward with the drilling expedition -- and the Obama administration for green-lighting it -- were pleased with the decision on Monday.

"While this is a victory for everyone who hoped to avoid a catastrophic spill -- or catastrophic climate change -- from Shell's plans, it's also proof positive that drilling in the Arctic is too costly to be effective and a bad bet for other energy companies," said Annie Leonard, the executive director of Greenpeace USA, which led protests against Shell this summer.

Shell and Republicans, though, blamed federal government regulations as among the reasons for abandoning the project.

"It is clear that the federal regulatory environment -- uncertain, ever-changing, and continuing to deteriorate -- was a significant factor in Shell's decision," Sen. Lisa Murkowski (R-Alaska) said.

JinkoSolar To Provide 50MW Of Solar Tech For Mexico Plant

Chinese solar manufacturer JinkoSolar Holding Co. Ltd. said Monday that it has partnered with Mexican conglomerate TSK Group to supply 49.8 megawatts of photovoltaic solar modules for what it says is the largest solar plant in Mexico.

EXPERT ANALYSIS

The Clean Power Plan Will Survive: Part 1

While opponents of the U.S. Environmental Protection Agency have issued several challenges to the Clean Power Plan, each will fail. For example, there is no merit to the argument that the EPA lacks authority under Section 111(d) of the Clean Air Act to regulate carbon emissions from power plants, says Patrick Parenteau, a professor at Vermont Law School.

10 Marketing Tips From A Young Partner Perspective

No one ever told you in law school that once you received the highly coveted associate job in a big firm, that to really succeed at that job and climb the ranks quickly you need to take on a

LEGAL INDUSTRY

Law360 Ranks The Busiest Patent Practices

There's been no shortage of work for patent lawyers in 2015, with a surge of new complaints hitting courts around the country. Here, Law360 ranks the law firms that picked up the lion's share of patent litigation work in the first half of 2015.

The Firms GCs Turn To When Hit With Patent Suits

With patent litigation on the rise, the companies most targeted by lawsuits have their patent counsel on speed dial. Here are the law firms the 10 most frequently sued companies have called on to defend them in 2015.

The Firms Filing The Most Trademark Cases

Highly specialized boutique law firms led the charge in filing new trademark cases in the first half of 2015, often on behalf of a few top fashion brands like Chanel and Coach. Here, Law360 looks at the firms that have been tapped to handle the suits filed by the most litigious companies in the world of trademarks.

Porn Studio Keeps Law Firms Busy

Critics say porn company Malibu Media is a "copyright troll" that uses mass litigation to extract settlements from Internet users, but the company is showing no signs of stopping. A Law360 report says the litigious studio and a handful of small firms have already filed more than 1,000 suits this year, putting Malibu on track to once again be the most prolific copyright plaintiff in the country.

Law360 Ranks Busiest Bankruptcy Practice Groups

BigLaw behemoths were bested by a group of small but well-located firms that were most often hired to handle major bankruptcy cases in the first half of 2015, according to a new Law360 report.

4 Firms Make $5 Billion Bankruptcy Club

Only four law firms were responsible for more than $5 billion each in debtor's assets for cases filed in the first half of 2015, earning a spot in Law360's first-ever $5 billion bankruptcy club.

The Firms Scoring The Most Ch. 15 Work

A number of big-ticket Chapter 15 petitions were filed in U.S. bankruptcy courts in the first six months of 2015 as foreign companies looked to restructure billions of dollars in debt. Here, Law360 looks at the law firms that managed some of the biggest of these petitions.

Five law firms led the pack in launching antitrust litigation in the first half of 2015, filing a spate of follow-on suits over alleged benchmark manipulation and auto parts price-fixing, as well as new cases that include accusations of a group boycott against construction equipment giants. Read on to find out which antitrust plaintiffs firms have been the busiest.

Trial Ace: Weil Gotshal's Diane Sullivan

Many lawyers fresh off a $1 billion win may not be described as "down-to-earth," but colleagues, clients and adversaries of Weil Gotshal & Manges LLP partner Diane P. Sullivan say her lack of an air is the very thing that allows her to dominate in the courtroom.

Most Feared Plaintiffs Firm: Beasley Allen

When bargaining for its $2 billion chunk of this year's proposed $18.7 billion settlement with BP over the Deepwater Horizon oil spill, Alabama got help from Beasley Allen Crow Methvin Portis & Miles PC, a product liability and consumer protection powerhouse that calls the state home.

Hughes Hubbard Lays Off Attys In Kansas City

New York-based Hughes Hubbard & Reed LLP is shrinking its Kansas City, Missouri, office amid a work slowdown, a firm spokesperson confirmed Monday.

Baker & McKenzie Stays On Top Of BigLaw Brands

Baker & McKenzie LLP remains the most widely recognized law firm brand in the world, according to a survey released Monday, with DLA Piper LLP and Clifford Chance LLP also standing out as firms with strong international brands.

Dewey Jury Note Reveals Uncertainty, Dissent

Jurors in the Dewey & LeBoeuf LLP accounting fraud trial sent a note on Monday expressing confusion over their basic duties and hinting at a possible split as deliberations entered an eighth day in New York state court.

Mintz Levin Atty Fired After Divorce Judge's Rebuke

A former Mintz Levin Cohn Ferris Glovsky & Popeo PC patent attorney confirmed Monday that the firm terminated his employment after news broke he'd been sanctioned $10,000 in his own divorce for ethical violations a New York judge said call into question his ability to practice law.

CARB Revamps Clean Fuel Standard

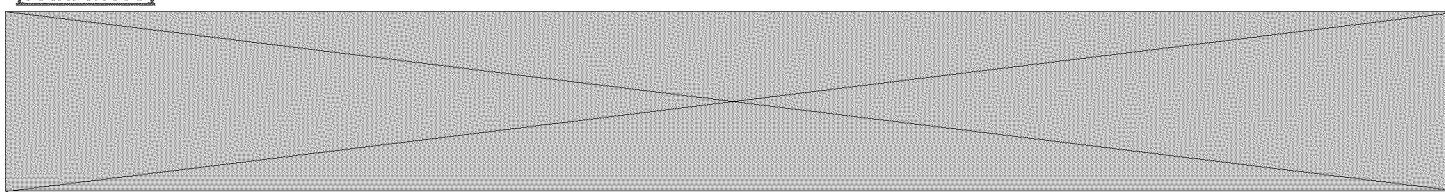
on 28 Sep 2015 by NGTNews

The California Air Resources Board (CARB) has unanimously voted to push forward with the state's controversial Low Carbon Fuel Standard (LCFS), which requires a 10% reduction by 2020 in the carbon intensity of transportation fuels in California. Furthermore, the agency also adopted a regulation governing alternative diesel fuels (ADFs). Established in 2007 by an executive order [read more]

Coalition Urges NCWM to Reconsider LNG Standard

on 25 Sep 2015 by NGTNews

A coalition including the American Public Gas Association (APGA), NGVAmerica and the American Trucking Association, among other groups, has signed a joint letter to the National Conference on Weights and Measures (NCWM), urging the organization to establish a national diesel gallon equivalent (DGE) standard for the dispensing of liquefied natural gas (LNG) as a transportation fuel. [read more]



FTA Offering More Grants for Alt-Fuel Transit Buses

on 28 Sep 2015 by NGTNews

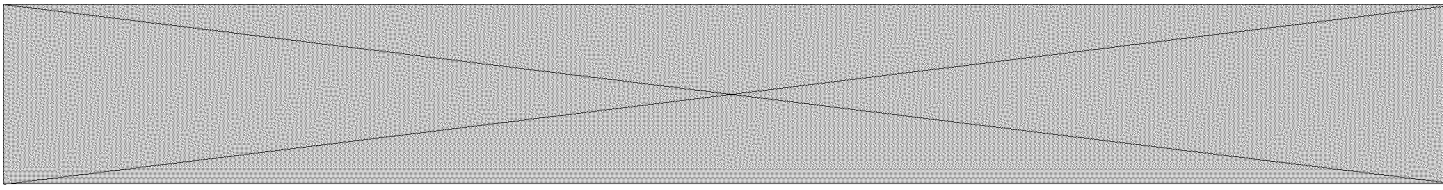
The U.S. Department of Transportation's Federal Transit Administration (FTA) has announced the latest round of funding under its Low or No Emission Vehicle Deployment Program (LoNo). The agency is making $22.5 million in new grants available to help deploy transit buses powered by

Raven Transport Rises to the Challenge with LNG Fleet

Plug Power's fuel cell business to the Hydrogen Fuel electric and hybrid engines. [read more]

on 28 Sep 2015 by NGTNews

In a new post on its website, natural gas refueling station developer Clean Energy Fuels Corp. highlights customer Raven Transport's big switch to liquefied natural gas (LNG). According to Clean Energy, Florida-based Raven Transport has a fleet of more than 500 trucks, 180 of which are powered by LNG. The carrier began its transition with 30 [read more]



Cenergy Opens ANG Test Center, Provides Tech Updates

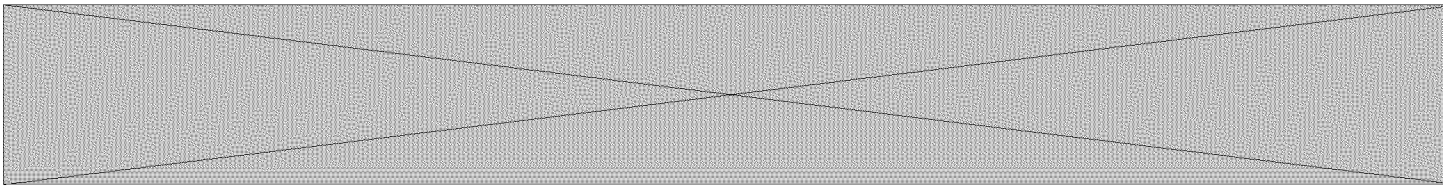
on 28 Sep 2015 by NGTNews

Nevada-based Cenergy Solutions has opened a new adsorbent natural gas (ANG) testing center in Fremont, Calif. The company says the technology developed and commercialized at the facility will enable consumers and businesses to transition gasoline and diesel vehicles to use natural gas and refuel at their homes and offices. Cenergy Solutions is also having its Generation [read more]

U.S. Gain and Questar Fueling Partner in Kansas City

on 28 Sep 2015 by NGTNews

U.S. Gain has partnered with Questar Fueling Co., a subsidiary of Utah-based Questar Corp., to add the GAIN Clean Fuel compressed natural gas (CNG) brand to an existing Questar Fueling CNG station in Kansas City, Kan. Questar Fueling opened the public-access station, located at 6580 Kansas Ave., last year. The facility offers six high-speed fueling lanes [read more]



CarterEnergy Opens Its First Public CNG Station

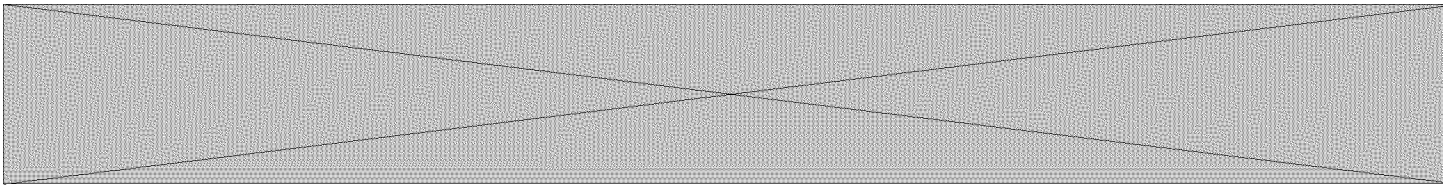
on 28 Sep 2015 by NGTNews

CarterEnergy, a division of World Fuel Services Corp., recently celebrated the grand opening of its first public-access compressed natural gas (CNG) station, located at 401 Kindleberger Rd., Kansas City, Kan. The station was built just north of CarterEnergy's new product distribution center in the Fairfax district and will provide a resource for area fleets to fuel [read more]

New CNG Shuttle Fleet for Burbank Bob Hope Airport

on 25 Sep 2015 by NGTNews

The Burbank-Glendale-Pasadena Airport Authority has awarded a $11.97 million, five-year contract to MV Transportation Inc. to provide courtesy shuttle services with a new fleet of compressed natural gas (CNG)-powered vehicles at the Burbank Bob Hope Airport in California. MV Transportation, which currently operates BurbankBus and the Glendale Beeline, will provide the airport with a model-year 2016 [read more]



N.J. Utility and Waste Management Open Public CNG Station

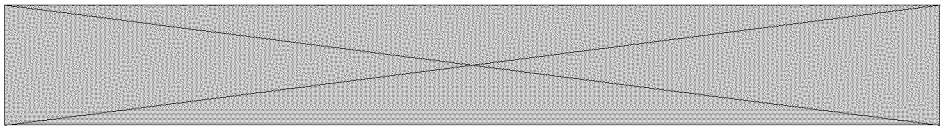
on 24 Sep 2015 by NGTNews

Under a pilot program, New Jersey Natural Gas (NJNG) has opened the first public-access compressed natural gas (CNG) fueling station to be located in Ocean County, N.J. The station is sited at a Waste Management Inc. facility in Toms River. "Throughout our history, New Jersey Natural Gas has celebrated many milestones, but to be part of [read more]

SoCalGas and City of Monterey Park Cut Ribbon on CNG Station

on 24 Sep 2015 by NGTNews

Southern California Gas Co. (SoCalGas) has completed a public-access compressed natural gas (CNG) fueling station for the City of Monterey Park, Calif. The facility, located at 751 S. Alhambra Ave., will support the operation of the city's Spirit bus fleet and other natural gas vehicles (NGVs). SoCalGas says the station is designed to meet the needs [read more]



Ricardo Participates in EU Heavy-Duty NGV Research

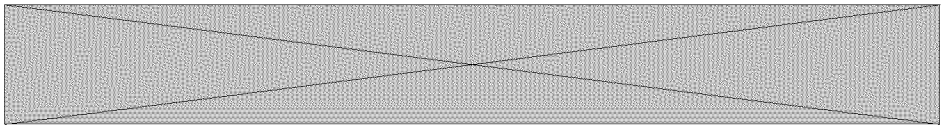
on 24 Sep 2015 by NGTNews

Ricardo has announced it is one of 19 collaborating commercial and academic partners participating in the European Commission's Horizon 2020 Green Vehicle Initiative project called HDGAS. According to Ricardo, HDGAS aims to develop, demonstrate and optimize advanced powertrain concepts for dual-fuel and dedicated natural gas heavy-duty vehicles. The primary objectives of HDGAS are to develop technologies [read more]

Nonprofit Defends Clean Diesel Vehicles in Wake of VW Scandal

on 24 Sep 2015 by NGTNews

As the Volkswagen diesel car emissions scandal continues to make headlines around the world, nonprofit organization the Diesel Technology Forum has issued a statement regarding clean diesel vehicles in the U.S. Although the group notes it "does not comment on specific cases or circumstances involving individual companies and enforcement actions by the government," the organization says, [read more]



American Natural Gas Hires New VP for Business Development

on 24 Sep 2015 by NGTNews

American Natural Gas (ANG), a New York-based company focused on providing natural gas refueling solutions, has hired James Norris as vice president of business and strategic development. Before joining ANG, Norris was a business development manager in the Mid-Atlantic region for Clean Energy Fuels Corp., where he was the recipient of the Boone Pickens Award for [read more]

NEWS UPDATE September 29, 2015

Omaha Fuel Tests Indicate High Level of Toxics in Base Gasoline

By Nebraska Ethanol Board • • Posted September 29, 2015

Does Omaha have bad gas? According to recent fuel tests, it does—at least in terms of the levels of toxic substances, which approached 30 percent by volume in base gasoline. But adding ethanol to gasoline significantly lowers the health threat of the fuel we put in our vehicles. In early July, four fuel samples were pulled from the Magellan fuel terminal in Omaha. The samples were independently tested by Midwest Laboratories in Omaha. [read more …]

Ex-Volkswagen CEO facing criminal probe

Sean Reilly, E&E reporter • • Posted September 29, 2015

German prosecutors have opened a preliminary investigation into any role that Martin Winterkorn, former chief executive officer of Volkswagen AG, may have had in an emissions cheating scheme affecting millions of diesel-powered vehicles. The inquiry will focus on who bears responsibility for rigging the cars to evade testing requirements, according to a news release today from the prosecutor's office in the central German city of Braunschweig, not far from Volkswagen AG's corporate headquarters in Wolfsburg. [read more …]

North Dakota getting more ethanol blender pumps

By JESSICA HOLDMAN – Associated Press • • Posted September 29, 2015

2007, Petro Serve USA has installed 80 ethanol blender pumps at its 24 North Dakota locations – some with the help of grants, others purchased outright. "Those pumps have

worked spectacularly for us," said CEO Kent Satrang.
[read more …]

N.D.'s boom-time governor confronts the oil bust

Mike Lee, E&E reporter • • Posted September 29, 2015

Minutes after Gov. Jack Dalrymple got through presiding over a vote to change the state's rules on natural gas flaring, he got an earful from a constituent. Technically, the audience isn't allowed to speak during meetings of the Industrial Commission, which oversees oil and gas regulation. The Republican governor chairs the three-member commission, which had just approved a compromise giving the industry relief from an interim goal to capture natural gas in the oil field, in exchange for further cuts over the long term. Case closed [read more …]

US ethanol production falls 2% to annualized rate of 14.59 billion gallons

By Biofuels Digest • • Posted September 29, 2015

According to EIA data as analyzed by the Renewable Fuels Association, ethanol production averaged 938,000 barrels per day (b/d)—or 39.40 million gallons daily. That is down 23,000 b/d from the week before. The four-week average for ethanol production stood at 952,000 b/d for an annualized rate of 14.59 billion gallons. Stocks of ethanol stood at 18.9 million barrels. That is a 3.3% increase from last week. Imports of ethanol were 44,000 b/d for the week. [read more …]

Panel to take second shot at sweeping bill this week

Hannah Northey, E&E reporter • • Posted September 29, 2015

The House Energy and Commerce Committee this week will try its hand once again at marking up a voluminous and contentious energy package after punting the job earlier this month. Democrats and Republicans will likely air their differing views about how energy legislation should tackle the issues of climate change, market reform and the nation's energy mix when opening statements are heard beginning tomorrow.

By Colleen Leahy

Today's Washington Brief

- Republican presidential candidate Jeb Bush's energy policy would lift the ban on U.S. oil exports and restrictions on natural gas exports, peel back the Obama administration's Clean Power Plan and approve the Keystone XL pipeline. (Reuters)

- The House Energy and Commerce Committee today will consider comprehensive energy legislation that could be on the House floor in the next couple of weeks. The bill covers issues such as energy efficiency and infrastructure but leaves out more controversial matters like the Keystone XL pipeline. (Morning Consult)

- The Washington-based American Coalition for Clean Coal Electricity will cut half of its employees, including its chief of staff. (Politico)

Today's Business Brief

- Bank of America, Citi, JPMorgan Chase, Goldman Sachs, Morgan Stanley and Wells Fargo said government action needs to accompany private investment to fight climate change, and in doing so they called for putting a price on carbon emissions. The banks' declaration adds to the list of U.S. businesses that support an accord in Paris later this year. (Huffington Post)

- Natural gas transportation company Energy Transfer Equity is acquiring pipeline operator Williams Cos. for approximately $32.61 billion. The combined businesses will be one of the five largest energy companies in the world. (CNBC)

- Oilfield-services companies Halliburton Co. and Baker Hughes Inc. are shedding a handful of businesses, which they said brought in $5.2 billion in 2013, as they seek regulatory approval for their $35 billion merger. (The Wall Street Journal)

General

Jeb Bush energy plan emphasizes jobs, lower prices
Steve Holland, Reuters

Republican U.S. presidential candidate Jeb Bush will lay out energy policy proposals on Tuesday that seek to spur job growth and take aim at President Barack Obama's plan to limit carbon emissions from power plants. In details of his plan released by his campaign, Bush will call for lifting a U.S. ban on crude oil exports and lift restrictions on natural gas exports that have made it harder to export energy to countries like Japan, China and the European Union.

As governor, Bush sided with campaign contributor on delaying Everglades pollution cleanup
Craig Pittman, Tampa Bay Times

During Bush's eight years as governor, he left a distinctive mark on several environmental programs. By far his most ambitious project was the Comprehensive Everglades Restoration Program. A crucial ally in getting the legislation passed was the sugar industry.

House Energy Bill Slated for Full Committee Vote
Deirdra O'Regan, Morning Consult

The House Energy and Commerce Committee will vote Wednesday on a multi-faceted energy bill with broad bipartisan support. The committee will begin consideration Tuesday at a meeting that is likely to be dominated by the other item on the agenda — legislation that would take federal money away from Planned Parenthood.

Obama: Trade would hold back the 'ravages' of climate change
John Siciliano, Washington Examiner

President Obama said Monday that breaking down trade barriers would protect future generations from the "ravages" of climate change. "We can roll back the pollution that we put in our skies and help economies lift people out of poverty without condemning our children to the ravages of an ever-warming climate," Obama told the United Nations General Assembly in New York.

Morgan Stanley Has Given Up on Energy Stocks
Luke Kawa, Bloomberg News

Towards the beginning of 2015, with crude oil prices in free-fall, Morgan Stanley's equity strategy team made a bold call, upgrading the energy sector to overweight. Now, in a display of candor that's rare on Wall Street, chief U.S. equity strategist Adam Parker is waving the white flag.

Assessing the Human Toll of Volkswagen's Diesel Deception
Margot Sanger-Katz andJohn Schwartz, The New York Times

Unlike the ignition defect in General Motors vehicles that caused at least 124 people to die in car crashes, Volkswagen pollution is harder to link to individual deaths. But it is clear to public health researchers that the air pollutants the cars illegally emitted damage health, and they have formulas to calculate the lives lost from excess pollution. After consulting with several experts in modeling the health effects of air pollutants, we calculated a death toll in the United States that, at its upper range, isn't far off from that caused by the G.M. defect.

Senate advances bill to prevent shutdown
Jordain Carney, The Hill

A short-term bill to fund the government through Dec. 11 overcame a key procedural hurdle in the Senate on Monday, just days before the deadline to avoid a shutdown. Senators voted 77-19 to end debate on the continuing resolution (CR) to fund the government. The move paves the way for final passage before the Oct. 1 deadline.

U.S. Index Futures Rebound as Investors Pause After Selloff
Alan Soughley and Camila Russo, Bloomberg News

U.S. stock-index futures rose, as investors kept faith in the world's biggest economy, betting that the selloff that sent equities to a one-month low was overdone. Standard & Poor's 500 Index E-mini contracts expiring in December rose 0.5 percent to 1,881.75 at 7:22 a.m. in New York, reversing an earlier drop of as much as 0.6 percent. Stocks slid on Monday as global equities tumbled amid a rout in commodity and biotechnology shares. Futures on the Dow Jones Industrial Average increased 60 points, or 0.4 percent, to 15,969, today.

Oil & Natural Gas

Oil rises as tighter U.S. market offsets Asia woes
Christopher Johnson, Reuters

Oil prices rose on Tuesday after evidence of tightening supplies in the United States, the world's biggest oil consumer, outweighed concerns over the health of the Chinese economy. China's giant manufacturing sector is shrinking, economists say, as domestic demand falters, fanning concern that the economy may be slowing more sharply than feared.

Energy Transfer Equity buying Williams Cos. for $32.61B
The Associated Press

Energy Transfer Equity is buying pipeline operator The Williams Cos. for approximately $32.61 billion. The companies said Monday that the combination creates one of the five biggest energy companies in the world.

Murkowski calls Shell pull-out a 'kick in the gut'
Liz Ruskin, Alaska Public Radio Network

Murkowski says dry holes are a fact of oil exploration, but she blames the federal government for curtailing Shell, and for frustrating Alaskan efforts to portray itself as open for business. "You've got a very, very difficult federal regulatory environment that can chase that business away," she said. "And we saw that over the course of seven years and $7 billion of commitment from Shell."

Halliburton, Baker Hughes to Sell More Businesses
Chelsea Dulaney, The Wall Street Journal

Halliburton Co. and Baker Hughes Inc. said Monday that they plan to unload a handful of other businesses as they continue to seek regulatory approval for their $35 billion merger. The companies said they plan to sell Halliburton's expandable liner hangers business; Baker Hughes's core completions business, which includes its packers, flow control tools and subsurface safety systems; Baker Hughes's sand control business in the Gulf of Mexico; and Baker Hughes's offshore cementing businesses in Australia, Brazil, the Gulf of Mexico, Norway and the United Kingdom.

Oil Traders May Look to the Sea for Profit Amid Price Collapse
Ben Sharples and Naomi Christie, Bloomberg News

While traders are already cashing in on the surplus by housing oil in onshore tanks across the globe — including on the tiny Caribbean island of St. Lucia — expanding the storage to tankers at sea may near a point where it becomes profitable, according to Citigroup Inc., Goldman Sachs Group Inc. and IHS Maritime & Trade. A structure called contango, when the price of a commodity to be delivered in the future is higher than if it was sold today, has been moving in the right direction.

Utilities & Infrastructure

Exelon asks DC regulators to reconsider vote on merger with Pepco
Thomas Heath, The Washington Post

Exelon on Monday filed a request with the D.C. Public Service Commission to resurrect its proposed $6.4 billion merger with Pepco, arguing the regulator erred in blocking the deal one month ago. At the same time, D.C. Mayor Muriel E. Bowser (D) signaled that her administration is in talks with the utilities to reach a settlement that could save the deal.

Size often matters for water utilities
Adam Wagner, Star News Online

Brunswick is emblematic of a national trend of consolidation among water and sewer utilities, one that experts and government officials alike say often occurs when smaller systems begin to show their age and need improvements that they either can't afford or don't want to pass along to a tiny customer base in the form of possibly steep rate hikes.

Renewables

Feds to Lease Land for NJ Offshore Wind
Carl Weinschenk, Energy Manager Today

The federal government is lending a hand to the struggling wind energy sector by leasing almost 350 acres of the ocean floor off the New Jersey coast for turbines. The plan is to auction two leases between Nov. 9-13.

APS withdraws controversial solar grid fee request
Krysti Shallenberger, Utility Dive

Arizona Public Service filed a request last Friday to withdraw its its proposed $21 grid

access fee if the state's utility regulators continue hearings on cost-of-service analysis for distributed solar. APS's move follows complaints from two former commissioners and solar advocates earlier this month that alleged bias against rooftop solar from three sitting commissioners on the Arizona Corporation Commission.

Vermont's updated energy plan reaffirms 90% renewable goal
Robert Walton, Utility Dive

On the road to 90% renewables, the plan sets interim goals of 25% by 2025 and 40% by 2035. And by 2025, the state wants to see at least 10% of transportation powered by clean energy, 30% of building energy demands met with it, and 67% renewable electric power.

Coal

'Clean coal' group downsizing amid industry struggles
Darren Samuelsohn, Politico

A leading "clean coal" lobbying shop is cutting half its staff and reorganizing to reflect the U.S. coal industry's market losses and the industry's continued financial struggles. The 22-year-old American Coalition for Clean Coal Electricity will lay off its chief of staff and also plans to eliminate several middle-management positions.

Nuclear

Entergy Seals Deal With New Hampshire Over Yankee Emergency Zone
Howard Weiss-Tisman, Vermont Public Radio

Entergy Vermont Yankee has reached an agreement with the state of New Hampshire over the company's request to reduce the emergency planning zone, or EPZ, around the closed nuclear power plant in Vernon. Entergy says the 10-mile EPZ should be eliminated after April 2016 as the plant undergoes decommissioning and the risk of a nuclear emergency is reduced.

Climate

Big Banks Call For 'Strong' Climate Deal
Ben Walsh, Huffington Post

Six big U.S. banks called for a "strong global climate agreement" in a statement Monday, with Bank of America, Citi, JPMorgan Chase, Goldman Sachs, Morgan Stanley and Wells Fargo arguing in a joint release that government action, in addition

to private business investment, is needed to address climate change.

Many Conservative Republicans Believe Climate Change Is a Real Threat
Coral Davenport, The New York Times

A majority of Republicans — including 54 percent of self-described conservative Republicans — believe the world's climate is changing and that mankind plays some role in the change, according to a new survey conducted by three prominent Republican pollsters. The results echo a number of other recent surveys concluding that despite the talk of many of the party's candidates, a significant number of Republicans and independent voters are inclined to support candidates who would back some form of climate action.

With cap and trade plan, China adopts emissions policy that couldn't get through U.S. Congress
Steven Mufson, The Washington Post

China may be the world's largest greenhouse gas producer, but Chinese President Xi Jinping is likely to make his new commitment to introduce a nationwide cap and trade program to limit greenhouse gas emissions a centerpiece of his speech at the United Nations General Assembly. But far from the television lights of New York, the effectiveness of an emissions trading system, now being used by seven Chinese cities, will hinge on how the system is designed and implemented.

Opinions, Editorials & Perspectives

Why the Pope is wrong about climate
Michael Grunwald, Politico

I figured I ought to read what His Holiness actually wrote his 184-page encyclical known as *Laudato Si*. And, it's, um, well…how to put this delicately…unusual?

Why Shell Has Gone Cold on the Arctic
Helen Thomas, The Wall Street Journal

Investors and activists both had something to celebrate Monday after Royal Dutch Shell ended its controversial program of exploration in the Arctic. Backing away from the Arctic is a step in the right direction.

Here's What Will Happen with the EPA Ozone Rule
Gretchen Goldman, Union of Concerned Scientists

Some sources are reporting that the agency is likely to go with 70 parts per billion (ppb) as the new standard. Other sources suggest that the White House is pushing the agency to instead go with a 68-ppb standard. What's the difference in those two

ppb? Both science and politics.

Congress must hold EPA responsible for its own environmental disaster
Steve Forbes, Fox News

The EPA's response to its own environmental disaster has been anything but honest, transparent or thorough. Many Colorado families, including members of the Navajo Nation and residents of nearby Silverton, are wondering if the EPA will ever hold anyone accountable. I'm not holding my breath.

Need Energy? Look to the sun
Mark Buchanan, Bloomberg View

When world leaders assemble in Paris next month for the United Nations Climate Conference, they will have to consider a difficult issue: Where humans will get enough energy to meet their needs without destroying the planet. From a purely scientific perspective, solar is the only solution.

Start Teaching Medical Professionals to Get Ready for Climate Change
Kathleen Potempa, The Wall Street Journal

Heat-related illnesses present a variety of symptoms and can exacerbate existing chronic conditions. We who are responsible for educating future clinicians must ensure they will have the skills to meet the changing health needs of their patients and communities.

Research Reports, Issue Briefs & Case Studies

Economic impacts of carbon dioxide and methane released from thawing permafrost
Chris Hope and Kevin Schaefer, Nature Climate Change

The Arctic is warming roughly twice as fast as the global average. If greenhouse gas emissions continue to increase at current rates, this warming will lead to the widespread thawing of permafrost and the release of hundreds of billions of tonnes of CO_2 and billions of tonnes of CH_4 into the atmosphere.

Subject: AIR POLLUTION: Senators urge DOJ to strongly penalize Volkswagen

AN E&E PUBLISHING SERVICE

AIR POLLUTION:
Senators urge DOJ to strongly penalize Volkswagen

Sean Reilly, E&E reporter

Published: Tuesday, September 29, 2015

The Justice Department should pursue "strong civil and criminal actions" against Volkswagen for any laws broken in the course of a long-running emissions-testing scam, two Democratic lawmakers said in a **letter** to Attorney General Loretta Lynch released yesterday.

"Such a blatant violation of the Clean Air Act must be met with an appropriately strong response," Sens. Amy Klobuchar (D-Minn.) and Richard Blumenthal (D-Conn.) wrote. "Officials at Volkswagen should be granted no get out of jail free card," they said, adding that DOJ should forgo any plea agreement with the German automaker that does not ensure that "all information regarding criminal acts by high level officials is provided to the Department."

Wyn Hornbuckle, a DOJ spokesman, declined to comment directly on the letter but said in an email that the department is working closely with U.S. EPA in investigating the allegations. "We take these allegations, and their potential implications for public health and air pollution in the United States, very seriously," Hornbuckle said.

Volkswagen has admitted to rigging almost a half-million diesel-powered passenger cars sold in the United States since 2008 with software to get them through emissions tests, even though the vehicles otherwise spew up to 40 times the allowable limits of nitrogen oxides.

Volkswagen's stock price has plunged more than 40 percent since EPA and the California Air Resources Board revealed the scheme Sept. 18. It has also cost Martin Winterkorn his job as chief of Volkswagen AG, the automaker's corporate parent. In stepping down last Wednesday, Winterkorn said he was unaware of any wrongdoing on his part, but was leaving to give Volkswagen a fresh start. German prosecutors said yesterday, however, that they are opening an investigation in part to determine whether he bears any responsibility.

Klobuchar and Blumenthal serve both on the Senate Judiciary Committee and the Senate Commerce, Science and Transportation Committee. The latter panel has responsibility for consumer protection policy; last week, its top Democrat, Sen. Bill Nelson of Florida, asked the Federal Trade Commission to seek redress for U.S. customers who bought Volkswagen and Audi cars on the assumption that they were getting "clean diesel" vehicles (***Greenwire***, Sept. 23). As of late yesterday, Nelson had not received a reply, according to a spokesman.

Feds to Lease Land for NJ Offshore Wind
Carl Weinschenk, Energy Manager Today

The federal government is lending a hand to the struggling wind energy sector by leasing almost 350 acres of the ocean floor off the New Jersey coast for turbines. The plan is to auction two leases between Nov. 9-13.

APS withdraws controversial solar grid fee request
Krysti Shallenberger, Utility Dive

Arizona Public Service filed a request last Friday to withdraw its its proposed $21 grid

access fee if the state's utility regulators continue hearings on cost-of-service analysis for distributed solar. APS's move follows complaints from two former commissioners and solar advocates earlier this month that alleged bias against rooftop solar from three sitting commissioners on the Arizona Corporation Commission.

Vermont's updated energy plan reaffirms 90% renewable goal
Robert Walton, Utility Dive

On the road to 90% renewables, the plan sets interim goals of 25% by 2025 and 40% by 2035. And by 2025, the state wants to see at least 10% of transportation powered by clean energy, 30% of building energy demands met with it, and 67% renewable electric power.

Coal

'Clean coal' group downsizing amid industry struggles
Darren Samuelsohn, Politico

A leading "clean coal" lobbying shop is cutting half its staff and reorganizing to reflect the U.S. coal industry's market losses and the industry's continued financial struggles. The 22-year-old American Coalition for Clean Coal Electricity will lay off its chief of staff and also plans to eliminate several middle-management positions.

Nuclear

Entergy Seals Deal With New Hampshire Over Yankee Emergency Zone
Howard Weiss-Tisman, Vermont Public Radio

Entergy Vermont Yankee has reached an agreement with the state of New Hampshire over the company's request to reduce the emergency planning zone, or EPZ, around the closed nuclear power plant in Vernon. Entergy says the 10-mile EPZ should be eliminated after April 2016 as the plant undergoes decommissioning and the risk of a nuclear emergency is reduced.

Climate

Big Banks Call For 'Strong' Climate Deal
Ben Walsh, Huffington Post

Six big U.S. banks called for a "strong global climate agreement" in a statement Monday, with Bank of America, Citi, JPMorgan Chase, Goldman Sachs, Morgan Stanley and Wells Fargo arguing in a joint release that government action, in addition

to private business investment, is needed to address climate change.

Many Conservative Republicans Believe Climate Change Is a Real Threat
Coral Davenport, The New York Times

A majority of Republicans — including 54 percent of self-described conservative Republicans — believe the world's climate is changing and that mankind plays some role in the change, according to a new survey conducted by three prominent Republican pollsters. The results echo a number of other recent surveys concluding that despite the talk of many of the party's candidates, a significant number of Republicans and independent voters are inclined to support candidates who would back some form of climate action.

With cap and trade plan, China adopts emissions policy that couldn't get through U.S. Congress
Steven Mufson, The Washington Post

China may be the world's largest greenhouse gas producer, but Chinese President Xi Jinping is likely to make his new commitment to introduce a nationwide cap and trade program to limit greenhouse gas emissions a centerpiece of his speech at the United Nations General Assembly. But far from the television lights of New York, the effectiveness of an emissions trading system, now being used by seven Chinese cities, will hinge on how the system is designed and implemented.

Opinions, Editorials & Perspectives

Why the Pope is wrong about climate
Michael Grunwald, Politico

I figured I ought to read what His Holiness actually wrote his 184-page encyclical known as *Laudato Si*. And, it's, um, well…how to put this delicately…unusual?

Why Shell Has Gone Cold on the Arctic
Helen Thomas, The Wall Street Journal

Investors and activists both had something to celebrate Monday after Royal Dutch Shell ended its controversial program of exploration in the Arctic. Backing away from the Arctic is a step in the right direction.

Here's What Will Happen with the EPA Ozone Rule
Gretchen Goldman, Union of Concerned Scientists

Some sources are reporting that the agency is likely to go with 70 parts per billion (ppb) as the new standard. Other sources suggest that the White House is pushing the agency to instead go with a 68-ppb standard. What's the difference in those two

ppb? Both science and politics.

Congress must hold EPA responsible for its own environmental disaster
Steve Forbes, Fox News

The EPA's response to its own environmental disaster has been anything but honest, transparent or thorough. Many Colorado families, including members of the Navajo Nation and residents of nearby Silverton, are wondering if the EPA will ever hold anyone accountable. I'm not holding my breath.

Need Energy? Look to the sun
Mark Buchanan, Bloomberg View

When world leaders assemble in Paris next month for the United Nations Climate Conference, they will have to consider a difficult issue: Where humans will get enough energy to meet their needs without destroying the planet. From a purely scientific perspective, solar is the only solution.

Start Teaching Medical Professionals to Get Ready for Climate Change
Kathleen Potempa, The Wall Street Journal

Heat-related illnesses present a variety of symptoms and can exacerbate existing chronic conditions. We who are responsible for educating future clinicians must ensure they will have the skills to meet the changing health needs of their patients and communities.

Research Reports, Issue Briefs & Case Studies

Economic impacts of carbon dioxide and methane released from thawing permafrost
Chris Hope and Kevin Schaefer, Nature Climate Change

The Arctic is warming roughly twice as fast as the global average. If greenhouse gas emissions continue to increase at current rates, this warming will lead to the widespread thawing of permafrost and the release of hundreds of billions of tonnes of CO2 and billions of tonnes of CH4 into the atmosphere.

Byron/Mike,
Not sure if you are the right people for this, but I thought you should at least be aware that this company is selling a product to allow individuals to remove their particulate traps. The say it is "for off-road use only", but it is hard to imaging any legitimate off-road use of a Jetta or Passat diesel. Diesel engines aren't even any good for club-level racing.

John

Description

A Malone Tuning ECM upgrade is required for your VW Jetta TDI DPF delete kit. The stock DPF emissions system from VW is a complex system that is closely monitored and controlled by your vehicles ECM (engine control module). Your ECM expects to see certain readings from the various sensors in the emissions system. When the DPF and other emissions components are deleted, your ECM will receive abnormal readings from the various sensors. As a result, diagnostic warning lights will go on, and the vehicle will no longer function properly. A Malone Tuning ECM upgrade will recalibrate the ECM to function at peak efficiency with the DPF deleted. The problematic EGR system will be completely disabled and the vehicle will no longer go into regeneration mode (this is when the engine dumps unburnt diesel into the exhaust to clean the DPF). In addition, the new ECM settings will take full advantage of the free flow exhaust and allow your engine to produce more power and burn less fuel. This is all done within the safety limits of the stock turbo.

How to get tuned:

Thanks to Audi & VW's increased efforts to prevent tuning, they have merely made our lives more difficult. The new ECMs from 2009+ must be removed from the vehicle and reprogrammed on the tuning bench. You can remove the ECM yourself however the reprogramming must be done by a trained professional with the proper equipment. Rawtek is an authorized Malone Tuning dealer and can do this for you.

Tuning Schedule and Turn Around Time:

Malone Tuning services are available through Rawtek on the following weekdays:

- Mondays (8am – 4pm EST)
- No Tuning on Tuesdays (if we receive your ECM on Tuesday, it will only be tuned the following day)
- Wednesday (8am – 4pm EST)
- Thursday (8am – 4pm EST)
- Friday (8am – 2pm EST)
- Saturday (Closed – No Tuning)
- Sunday (Closed – No Tuning)

ECM's are usually tuned and shipped back out the same day we get them. If we receive your ECM late in the day, or on a Tuesday, it will be shipped back out the next business day. Please note that if we receive your ECM late on Friday, it will not ship until Monday. So if you are in a rush to get your ECM tuned please try to avoid having us receive it on Tuesday or Friday.

What you need to do:

1. Select your Tune.
2. Select one of the 3 Express Overnight Shipping options:
   - ○ No - I'll ship it myself (if you want to ship your ECM to us your own way)
   - ○ 1 Way - Return w/ Parts (+$50) (We will hold the rest of your order here until we receive your ECM. Then we will return your ECM in the box with your parts. Saves money but takes longer)
   - ○ 2 Way - Roundtrip (We will ship out the rest of your order right away. Then you can send us your ECM when you are ready and we will send it back to you within 1 business day. Minimize vehicle downtime.)
3. Pay for your order
4. Remove the ECM from your vehicle (see ECM Removal Guides bellow)
5. If you purchased prepaid shipping we will email you the shipping label and customs documents (if international). You will print 3 copies of everything. Then you can drop off the package at UPS with all of the paperwork provided.
6. Once we get your ECM, we will tune it and ship it back out within 1 business day.
7. Re-install your ECM and you are good to go!

Stage 2 Performance details: (most popular)

- Up to 176(stage 2) wheel horsepower*
- Up to 330(stage 2) wheel torque*
- Up to 20% better fuel economy (+10 mpg)
- Increased reliability, lower maintenance costs
- Requires DSG tuning (if equipped with DSG transmission)

*with Performance Exhaust Kit

Stage 1 Tune details:

- Improved power and torque but less aggressive than Stage 2
- Up to 20% better fuel economy (+10 mpg)
- Increased reliability, lower maintenance costs
- Requires DSG tuning (if equipped with DSG transmission)

Econo & Stage 0.5 Tune details:

- Stock power and torque (econo)
- Stock torque and + 21 hp (stage 0.5)
- Up to 20% better fuel economy (+10 mpg)
- Increased reliability, lower maintenance costs
- Does NOT require DSG tuning (if equipped with DSG transmission)

Application:

North America Spec Vehicles Only

- VW Jetta TDI with 2.0L CR engine (2014)

Requirements:

- Rawtek TDI DPF delete exhaust kit
- Warning: Running this DPF delete software with your stock exhaust WILL clog your diesel particulate filter, which may ultimately cause damage to your turbo and other engine components.

Executive summary

Emissions testing in the laboratory forms an essential part of the European type approval procedure for light-duty vehicles. The approach yields reproducible and comparable emissions data and provides clear design criteria for vehicles that have to comply with applicable emission limits. Although emission limits have become increasingly stringent in the past decade, road transport remains the most important source of urban air pollution in Europe with respect to NO_X (nitrogen oxides) and CO (carbon monoxide). Several studies have indicated that in particular on-road NO_X emissions of light-duty diesel vehicles might substantially exceed emission levels as identified during emissions testing in the laboratory. Still, a comprehensive analysis of on-road emissions of light-duty diesel and gasoline vehicles is unavailable to date.

This report addresses the existing knowledge gaps by using Portable Emission Measurement Systems (PEMS) to analyze the on-road emissions of 12 light-duty diesel and gasoline vehicles that comply with Euro 3-5 emission limits and comprise small and midsize passenger cars, two transporters, and a minivan. The selected vehicles where tested on four test routes, representing rural, urban, uphill/downhill, and motorway driving.

The PEMS results indicate that average NO_X emissions of diesel vehicles (0.93 ± 0.39 g/km), including Euro 5 diesel vehicles (0.62 ± 0.19 g/km), substantially exceed respective Euro 3-5 emission limits. The observed deviations range from a factor of 2-4 for average NO_X emissions over entire test routes up to a factor of 14 for average NO_X emissions of individual averaging windows. By comparison, on-road NO_X emissions of gasoline vehicles as well as CO and THC (total hydrocarbon) emissions of both diesel and gasoline vehicles generally stay within Euro 3-5 emission limits. The share of NO_2 (nitrogen dioxide) in the total NO_X emissions reaches 60% for diesel vehicles but is substantially lower for gasoline vehicles (0-30%). The tested light-duty diesel and gasoline vehicles emit during on-road testing on average 189 ± 51 g CO_2/km (grams carbon dioxide per kilometre) and 162 ± 29 g CO_2/km, respectively, thereby exceeding the CO_2 emissions as specified during laboratory testing by on average 21 ± 9%. The magnitude of on-road emissions varies depending on vehicle type, operation mode, route characteristics, and ambient conditions. Cold-start emissions of both diesel and gasoline vehicles span over a wide value range; NO_X emissions exceed Euro 3-5 emission limits by a factor 2-14, CO emissions often exceed emission limits, and THC emissions are both below and above Euro 3-5 emission limits.

The PEMS equipment is reliable and provides accurate emission measurements. PEMS are able to verify the proper operation of emission control technologies under a wide variety of normal operating conditions and suitable for testing emissions of novel fuel/engine/after-treatment/powertrain technologies (e.g., parallel/serial (plug-in) hybrid vehicles. PEMS analyses, including the presented results, may also be useful for updating current transport emission models and inventories. The PEMS procedure for light-duty vehicles is, however, relatively new and requires further refinement before being applied at large scale. Future PEMS applications may particularly focus on polluting driving modes such as cold start at very low temperatures and driving at very high speed as it occurs on the German Autobahn.

The findings of this report indicate that the current laboratory emissions testing fails to capture the wide range of potential on-road emissions. A promising remedy for this problem may be attained by supplementing laboratory emissions testing with complementary test procedures such as PEMS on-road emissions testing. This report provides a first step into that direction, thereby contributing to a more comprehensive EU policy that assures compliance of light-duty vehicles with emission limits under normal conditions of use.

1 Introduction

Emissions testing in the laboratory forms an essential part of the type approval procedure for light-duty vehicles within the European Union. Emissions testing follows a predefined procedure that consists of a specified driving cycle as well as prescribed test conditions at which vehicles are tested on a chassis dynamometer (EC, 2007a,2008). This approach yields verifiable and comparable data on emissions and fuel consumption and provides clear design criteria for light-duty vehicles, which have to comply with currently applicable emission limits.

Although emission limits have become increasingly stringent in the past decade, road transport remains the most important source of NO_X (nitrogen oxides) and CO (carbon monoxide) emissions by 2008, contributing 41% and 34%, respectively to the total emissions of these pollutants within the European Union (EEA, 2010). In particular, urban air pollution continues to persist at high levels, with 16% and 26% of EU's urban population being exposed to higher NO_2 (nitrogen dioxide) and PM_{10} (particulate matter of 10 micrometers or less) concentrations than specified by applicable air quality standards (EEA, 2009). Persisting air quality problems have triggered several policy responses that are targeted at emissions of light-duty vehicles:

(i) The introduction of more stringent emission limits for light-duty vehicles with Euro 5b in 2011 and Euro 6 in 2014 (EC, 2007a,2008).

(ii) The replacement of the currently applied New European Driving Cycle (NEDC) by a world-wide harmonized driving cycle in 2014 (EC, 2009a).

(iii) Potentially, the implementation of supplementary measures for verifying vehicles' emissions outside of the emissions testing with a single standardized driving cycle in 2014.

Particular concerns arise because emissions testing with the NEDC under laboratory conditions might not represent the actual on-road emissions of light-duty vehicles with sufficient accuracy. Several studies have indicated that specifically on-road NO_X emissions of light-duty diesel vehicles might substantially exceed Euro 2-4 emission limits (Pelkmans and Debal, 2006; Hausberger and Blassnegger, 2006; Vojtisek-Lom, 2009). Yet, comprehensive analysis of on-road emissions of light-duty diesel and gasoline vehicles that comply with Euro 3-5 is still unavailable.

This report addresses the existing knowledge gaps by using Portable Emission Measurement Systems (PEMS) to analyze the on-road emissions of 12 light-duty diesel and gasoline vehicles. The selected vehicles include small and midsize passenger cars as well as transporters and a minivan. The analysis contributes further to a knowledge base on real-world driving patterns within the European Union.

The results might assist the design of a road map for developing a suitable on-road emissions test procedure that could supplement the world-wide harmonized driving cycle in the European type approval of Euro 6 vehicles by 2014 (EC, 2007a). The report thereby contributes to a comprehensive EU environmental and industrial policy that assures compliance of light-duty vehicles with emission limits under normal conditions of use.

VW FOIA, EPA 06/20/2017 2017-FFP_027314

This report continues by presenting principal background information on the European emissions legislation as well as on laboratory emissions testing and PEMS (Section 2). Afterwards, Section 3 presents the research methodology and Section 4 provides the results of the PEMS analyses. The report finishes with a discussion (Section 5) and conclusions (Section 6).

VW FOIA, EPA 06/20/2017 2017-FFP_027315

2 Background

This section sets the stage for the later analyses by presenting information on (i) the status of emission legislation within the European Union with respect to light-duty vehicles, (ii) the official procedure to test emissions of light-duty vehicles, and (iii) the current developments in the on-road emissions testing with PEMS.

2.1 The current status of European light-duty vehicle emissions legislation

Emissions testing as part of the type approval procedure for light-duty vehicles is regulated within the European Union by the Co-decision regulation No. 715/2007 of 20 June 2007 (EC, 2007a) and the Comitology regulation No. 692/2008 of 18 July 2008 (EC, 2008). These regulations refer to vehicles of:

(i) categories M1 and M2 - passenger vehicles comprising no more than eight seats in addition to the driver's seat and having a maximum mass not exceeding 5 tonnes

(ii) categories N1 and N2 - vehicles used for the carriage of goods and having a maximum mass not exceeding 12 tonnes

Vehicles of these categories currently have to comply, with the exception of a few vehicle types used for special purposes, with Euro 5 emission limits of the following pollutants (Table 1):

(i) total hydro carbons (THC)

(ii) non-methane hydro carbons (NMHC)

(iii) nitrogen oxides (NO_X)

(iv) carbon monoxide (CO)

(v) particulate matter (PM) in the case of diesel engines and gasoline direct injection engines

The European emission legislation includes additional provisions, such as requirements for low temperature emission tests at -7°C for gasoline vehicles, which have to comply with limits of 15 g/km for CO and 1.8 g/km for HC, measured over the urban part of the NEDC (EC, 2001). Carbon dioxide emissions are currently unrestricted at the level of individual vehicles. The European Commission, however, defines a target for the fleet-average CO_2 emissions of new passenger cars of 130 g CO_2/km for a reverence car mass of 1372 kg (EC, 2009a).

VW FOIA, EPA 06/20/2017 2017-FFP_027316

Table 1: Currently applicable Euro 5 emission limits for light-duty vehicles of category M1 (EC, 2007a)

Pollutant	Emission limits for vehicles with spark ignition engines in mg/km	Emission limits for vehicles with compression ignition engines in mg/km
THC	100	-
NMHC	68	-
NO_X	60	180
$HC+NO_X$	-	230
CO	1000	500
PM	5.0/4.5[1]	5.0/4.5[1]

- not regulated

[1] The emission limit of 5.0 mg/km refers to Euro 5a, which is relevant for category M1 vehicles since September 2009. The emission limit of 4.5 mg/km refers to Euro 5b, which will be relevant for category M1 vehicles from January 2011 onwards.

In view of the introduction of more stringent Euro 6 emission limits in 2014, Regulation 715/2007 (EC, 2007a) contains provisions that should assure compliance of vehicles with applicable emission limits during both type approval and on-road driving under normal conditions of use[1]:

(i) Recital (15) requests the Commission to investigate the use of PEMS and so-called *not-to-exceed* regulatory concepts in the context of the revision of the NEDC.

(ii) Article 4(2) requires that manufacturer ensure an effective limitation of emissions pursuant to this Regulation, throughout the normal life of the vehicles under normal conditions of use.

(iii) Article 5(2) in conjunction with the definition in Article 3(10) prohibits the use of defeat devices under conditions that are likely to occur during normal vehicle operation, if these conditions are not substantially included in the test procedures for verifying emissions[2].

(iv) Article 14(3) requires the European Commission to keep reviewing procedures, tests, and requirements used to measure emissions. If reviews identify that provisions are no longer adequate or, in particular, do not reflect on-road emissions from real-world driving, the provisions should be adapted accordingly through the Comitology procedure.

The compliance of light-duty vehicles with applicable emission limits is verified by emissions testing on the chassis dynamometer in the laboratory. The next section describes in greater detail the key characteristics of the driving cycle, i.e., the NEDC that is currently used for standard laboratory emission tests within the European Union.

[1] Normal conditions of use might also include particularly polluting driving pattern such as driving at very high speeds, as it is frequently observed on the German autobahn, engine cold start at very low temperatures, or idling in congested traffic that may cause a cool down of after-treatment devices.

[2] Defeat devices are elements of design that sensor certain ambient and vehicle parameters for the purpose of influencing the operation of any part of the emission control systems, resulting in a reduced effectiveness of emission control technologies.

VW FOIA, EPA 06/20/2017 2017-FFP_027317

2.2 The test procedure for light-duty vehicle emissions within the EU

Emissions testing as part of the type-approval process for light-duty vehicles has to balance two criteria:

(i) quantifying as far as possible vehicle emissions under real-world driving conditions
(ii) assuring reproducibility and comparability of emission measurements

The testing of emissions and fuel consumption of light-duty vehicles takes place in the laboratory on chassis dynamometers. The details of the test procedure are described by Directive 98/69/EC (EC, 1998) and its further amendments.

Before the emissions test, vehicles have to soak for at least 6 hours at a test temperature of 20-30°C. Emissions are then measured while vehicles follow the speed profile of the New European Driving Cycle (NEDC). The entire NEDC consists of four repeated ECE-15 driving cycles of 195s duration each and one extra-urban driving cycle (EUDC) of 400s duration (Figure 1).

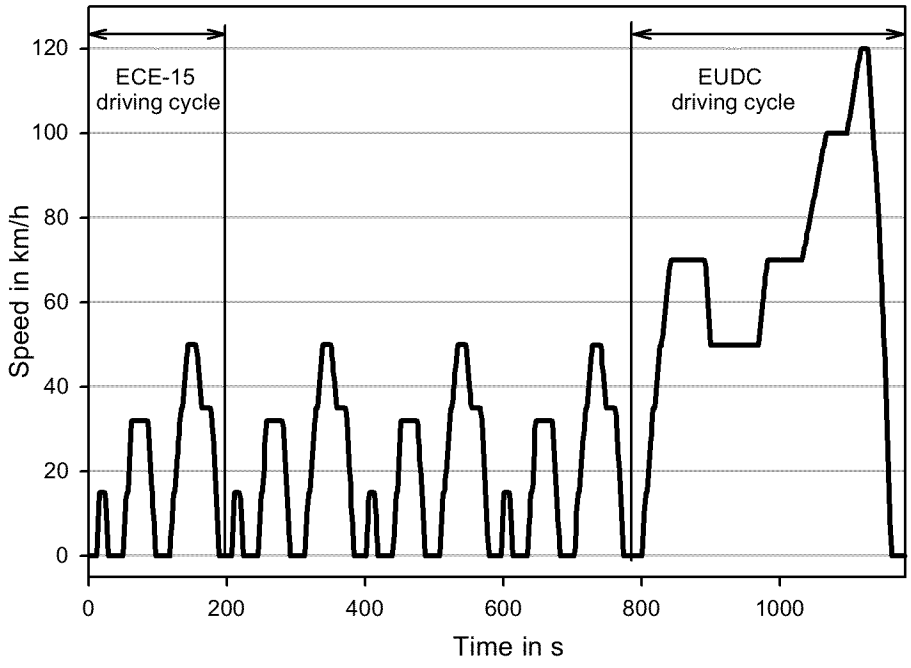

Figure 1: Speed profile of the New European Driving Cycle (NEDC)

The four ECE-15 cycles represent urban driving conditions that are characterized by low vehicle speed, low engine load, and low exhaust gas temperature. By contrast, the EUDC in the second part of the NEDC accounts for extra-urban and high speed driving modes up to a maximum speed of 120 km/h. The entire NEDC covers a distance of 11,007 m in a time period of 1180 s and at an average speed of 34 km/h. An initial idling period has been eliminated in the NEDC, thus emissions sampling begins with the start of the engine. Emissions are typically sampled with a Constant Volume Sampler (CVS) and expressed as averages over the entire test cycle in grams per kilometre [g/km] for each of the regulated pollutants (see Table 1).

The main characteristics of the NEDC in comparison to other certification cycles, i.e., the US FTP-75 driving cycle and the Japanese JTC cycle as well as the ARTEMIS urban driving cycle are provided in Table 2. The NEDC was developed to assure comparability and reproducibility of vehicle emissions that have been tested at standard conditions. Such an approach to emissions testing

VW FOIA, EPA 06/20/2017 2017-FFP_027318

comes inevitable with limitations regarding the ability to reproduce actual on-road emissions. Criticism of the NEDC refers in particular to its smooth acceleration profile (André and Pronello, 1997) that requires only a very narrow range of possible engine operation points (Kageson, 1998).

Table 2: Comparison the key characteristics of selected driving cycles

	NEDC	ECE-15	US FTP-75	JTC 10-15 mode
Region	EU	EU	USA	Japan
Trip duration [s]	1180	780	1874	660
Trip distance [km]	11.007	4.052	17.77	4.16
Average speed [km/h]	33.6	18.7	34.1	22.7
Maximum speed [km/h]	120	50	91	70
Share [%]				
- Idling	24	30	19	32
- low speed >0≤50 km/h	55	70	60	49
- medium speed >50-90 km/h	14	0	19	19
- high speed >90 km/h	7	0	2	0

Table 2 (continued): Comparison the key characteristics of selected driving cycles

	ARTEMIS urban	ARTEMIS rural	ARTEMIS motorway[1]
Region	EU	EU	EU
Trip duration [s]	920	1081	1067
Trip distance [km]	4.47	17.27	28.74 (29.55)
Average speed [km/h]	17.5	57.5	97.0 (99.7)
Maximum speed [km/h]	58	112	132 (150)
Share [%]			
- Idling	29	3	2 (2)
- low speed >0≤50 km/h	69	31	15 (15)
- medium speed >50-90 km/h	2	59	13 (13)
- high speed >90 km/h	0	7	70 (70)

[1] Values in parentheses indicate the 150 km/h specification of the ARTEMIS motorway driving cycle.

The NEDC only insufficiently represents on-road driving pattern that are characterized by low speed and high torque operation, steep and dynamic transient velocities, and driving at very high-speed. It is hence likely that vehicles comply with applicable emission limits during NEDC testing although they might show substantially higher pollutant emission levels alongside with elevated fuel consumption and CO_2 emissions on the road (André, 1996; Hausberger and Blassnegger, 2006; Pelkmans and Debal, 2006; Tzirakis et al., 2006). These limitations have been acknowledged by the European Commission and triggered the current research activities around the implementation of Euro 6 by 2014, including the development of (i) a more representative and internationally harmonized driving cycle as well as (ii) a supplemental off-cycle emissions test procedure for assessing the on-road emissions of light-duty vehicles for type approval (EC, 2009c).

VW FOIA, EPA 06/20/2017 2017-FFP_027319

2.3 Current developments in on-road emissions testing with PEMS

On-road emissions testing with PEMS has been so far mainly developed to evaluate the in-service conformity of EURO V and EURO VI engines of heavy-duty vehicles (EUR, 2006a,b,c; Bonnel and Kubelt, 2010). Emissions testing of heavy-duty vehicles as part of the type approval procedure is specified by Regulation (EC) No. 595/2009 of the European Parliament and of the Council (EC, 2009b). This regulation defines rules for the in-service conformity of vehicles and the durability of emission control devices. In particular, EC (2009b) suggests (i) considering the application of portable emission measurement systems (PEMS) for verifying the in-service conformity of heavy-duty vehicles and (ii) introducing supplemental procedures to control on-road (so-called *off-cycle*) emissions.

Verifying the in-service conformity of heavy-duty vehicles typically requires to remove the engine from the vehicle and to test its emissions in dedicated engine test cells. Such an approach is, however, very impractical and expensive. Therefore, it has been proposed to develop a protocol for in-service conformity checking of heavy-duty vehicles based on PEMS. The European Commission (DG ENTR in co-operation with DG JRC) launched in January 2004 a co-operative research programme to study PEMS applications for heavy-duty vehicles within the European Union. The experimental activities started in August 2004 and resulted in a successful application of PEMS to heavy-duty vehicles (Bonnel and Kubelt, 2010). Following the success of the EU-PEMS project, the European Commission announced the intention to launch a manufacturer-run pilot programme at the 97th Motor Vehicle Emissions Group (MVEG) Meeting on 1 December 2005. The main purpose of the programme was to evaluate the PEMS-based technical and administrative procedures for a larger range of technologies and in statistically more significant numbers. The PEMS pilot programme was started in autumn 2006; the outcome of the programme is expected to provide further insight on the potentials to introduce in-service conformity provisions based on PEMS in the European type-approval legislation for heavy-duty vehicles.

Based on their successful application to heavy-duty vehicles, PEMS might potentially also be applicable to light-duty vehicles as supplemental measure to ensure that vehicle emissions are appropriately controlled outside standardized laboratory conditions (EC, 2007a. The JRC initiated a first PEMS test campaign to obtain insights into the suitability of PEMS for emissions testing of Euro 3-4 light-duty vehicles in 2007 based on an Administrative Arrangement with DG ENTR (EC, 2007c). The PEMS testing of Euro 5 vehicles in 2009 and 2010 was then commissioned by the recent Administrative Arrangement No. SI2.552273 between the JRC and DG ENTR (EC, 2009c). The aim of this Administrative Arrangement was in particular to obtain on-road emission values for a range of Euro 5 vehicles and thereby supporting the development of suitable off-cycle emission test procedures that might supplement the standard laboratory emission test of Euro 6 vehicles from 2014 onward. The results of both test campaigns are documented in the present report, which continues in the next section by explaining in greater detail the methodology used for the PEMS test campaign of light-duty vehicles.

VW FOIA, EPA 06/20/2017 2017-FFP_027320

3 Methodology

The methodology section contains four parts: the first part provides an overview of test vehicles; the second part presents the routes used for PEMS testing; the third part explains PEMS equipment and test protocol; the fourth part explains data processing and data analysis.

3.1 Test vehicles

The analysis presented in this report includes passenger cars, i.e., vehicles of category M1, for which the currently applicable emission limits are provided in Table 1. The PEMS test fleet consists of 12 light-duty vehicles, comprising 5 gasoline vehicles, 1 gasoline-hybrid vehicle, and 6 diesel vehicles. Nine vehicles represent small and compact passenger cars, one vehicle is a minivan, and two vehicles represent small transporters. All test vehicles belong to category M1 of the European type approval classification (EC, 2007b), are sold on the European market, and passed type approval based on Euro 3-5 emission limits (Table 3). The second phase of the PEMS test campaign in the years 2009 and 2010 focused in particular on Euro 5 vehicles with the aim of complementing the data generated for Euro 3 and Euro 4 vehicles during the first project phase between 2007 and 2008.

3.2 PEMS test routes

The PEMS test campaign started with the testing of Vehicles A and C on local routes, including trips from Ispra to Milan as well as in down-town Milan. Based on the results of these tests, four defined routes were developed (Table 4, Figure 2), which later served as standard test routes for all subsequent PEMS tests of Vehicles B and D-L. The characteristics of these four test routes reflect as far as possible the diversity of normal on-road driving in Europe and include:

(i) Route 1: Ispra-Milan-Ispra; representing a mix of rural and motorway driving
(ii) Route 2: Ispra-Varese-Ispra; representing a mix of rural and urban driving
(iii) Route 3: Ispra-Sacro Monte-Ispra; representing a mix of rural and severe uphill-downhill driving with an elevation difference of around 800 m
(iv) Route 4: Motorway; representing high-speed driving at speeds of up to 130 km/h

Figures 3 and 4 provide an overview of altitude profiles and the typical speed distributions of the four test routes.

VW FOIA, EPA 06/20/2017 2017-FFP_027322

Table 3: Specifications of test vehicles

Vehicle	Vehicle category	Model year	Mileage at test start [km]	Fuel	Engine capacity [ccm]	Maximum engine power [kW]	Mass of CO_2 emitted during standard NEDC testing [g/km] / [cumulative kg]	Emission treatment technology	Applicable emission limit
A	N1 (small transporter)	2007	20,743	diesel	1997	69	182 / 2.00	oxidation catalyst, no DPF	Euro 3, Class II
B	M1 (minivan)	2007	13,831	gasoline	1798	88	169 / 1.86	3-way catalyst	Euro 3
C	N1 (small transporter)	2007/8	~20,000	diesel	2461	96	218 / 2.40	oxidation catalyst, no DPF	Euro 4, Class II
D	M1 (small passenger car)	2007	~800	diesel	1461	50	120 / 1.32	oxidation catalyst, no DPF	Euro 4
E	M1 (compact passenger car)	2004	~100,000	diesel	1896	77	140 / 1.54	oxidation catalyst; no DPF	Euro 4
F	M1 (small passenger car)	2007	16,996	gasoline	1149	55	139 / 1.53	3-way catalyst	Euro 4
G	M1 (compact passenger car)	2007	1,023	gasoline-hybrid	1497	57*	104 / 1.14	3-way catalyst	Euro 4
H	M1 (compact passenger car)	2009	3,408	diesel	1598	88	129 / 1.42	oxidation catalyst, DPF	Euro 5
I	M1 (compact passenger car)	2009	4,667	diesel	1995	130	128 / 1.41	oxidation catalyst, DPF	Euro 5
J	M1 (compact passenger car)	2009	~5,000	gasoline	1595	75	166 / 1.83	3-way catalyst	Euro 5
K	M1 (small passenger car)	2009	-10,000	gasoline	1242	51	119 / 1.31	3-way catalyst	Euro 5
L	M1 (small passenger car)	2010	1,909	gasoline	1242	44	127 / 1.40	3-way catalyst	Euro 5

[1] gasoline engine only

Table 4: Characteristics of PEMS test routes

Test route	Section	Distance [km]	Typical average speed [km/h]
Route 1	rural	35	50
	motorway	100	90
	Total	**135**	**65**
Route 2	rural	51	40

	Total	**132**	**71**

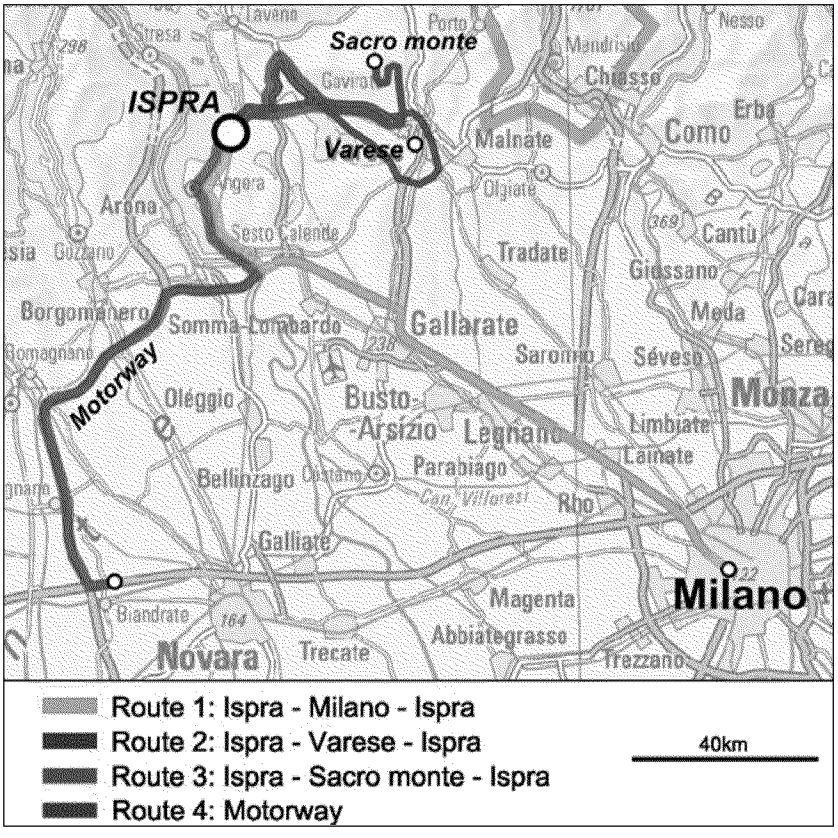

Figure 2: Topographic map of the PEMS test routes

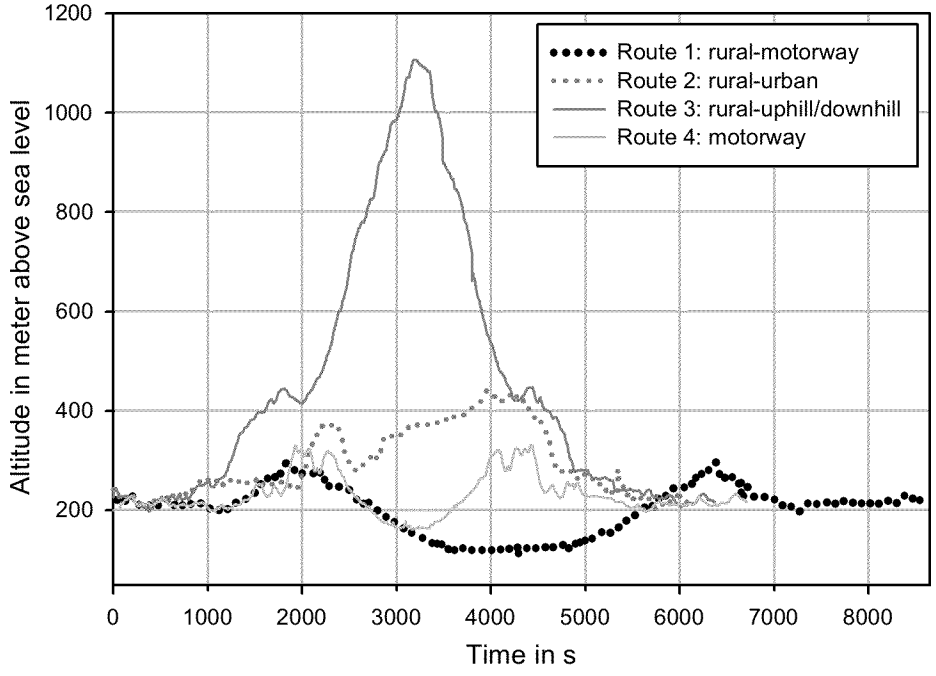

Figure 3: Altitude profiles of PEMS test routes; NEDC testing, by comparison, does not include any altitude changes

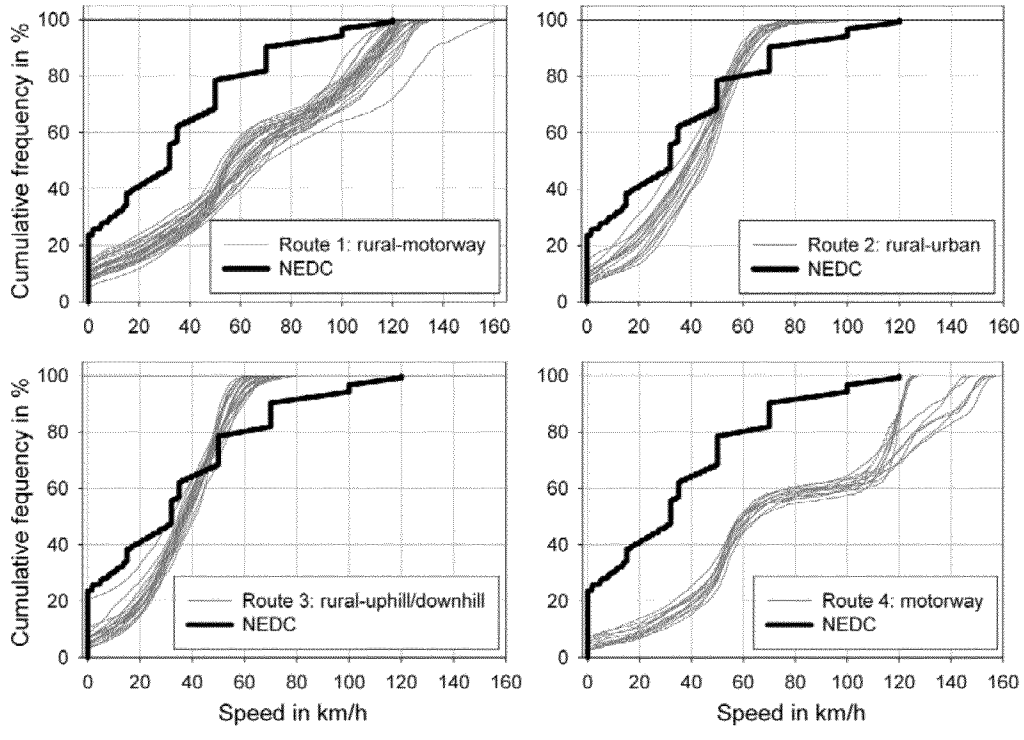

Figure 4: Typical speed distributions of PEMS test routes in comparison to the NEDC

The four test routes represent different on-road driving pattern, which can also be characterized by plotting the relative positive acceleration (RPA) as function of vehicle speed. The RPA is calculated as the integral of the product of instantaneous speed and instantaneous positive acceleration over a defined section of the test route, a so-called sub-trip, such as:

VW FOIA, EPA 06/20/2017 2017-FFP_027325

$$RPA = \frac{\int_0^{t_j} (v_i \times a_i) dt}{x_j}$$ (*Equation 1*)

where: t_j = time
x_j = distance of sub-trip *j*
v_i = speed during each increment *i*
a_i = instantaneous positive acceleration during each increment *i* contained in the sub-trip *j*

A sub-trip is defined here as any part of the test route, in which the vehicle speed is at least 2 km/h for a period of at least 5 seconds. Individual sup-trips are separated from each other by periods of idling or very slow motion in congested traffic. The length and number of sub-trips contained in a PEMS test depends on the route characteristics and the traffic situation and might show substantial variability both between and within individual test routes. Thus, sub-trips may differ substantially in their length. The maximum achievable RPA is directly related the vehicle power. Additional factors affecting the magnitude and distribution of RPA values such as: (i) the drivers' behaviour and driving style, (ii) climatic and ambient conditions, as well as (iii) traffic and road conditions. The distribution of RPA values allows comparing the characteristics of different routes and may be used as criterion to standardize on-road PEMS emissions testing.

The RPA values of the individual PEMS test routes show distinct pattern that differ from the ones of the NEDC (Figure 5). In particular Routes 1 and 4 include a larger share of high-speed driving than the NEDC. Vehicle testing on the four test routes covers furthermore a substantially larger range of the RPA-speed spectrum than does the conventional NEDC testing. Low RPA values in the range of 0.1-0.4 m/s^2 at velocities of 0-50 km/h represent the majority of driving conditions on our four PEMS test routes. Still extreme conditions exist such as RPA values above 1 m/s^2 at low speeds or relatively low RPA at high speeds in the range of 120-130 km/h occur; these driving conditions are not covered by the NEDC.

Overall, Route 1 with a mix of rural and motorway driving seem to capture best the potentially large variability of on-road driving conditions. Still, driving on identical routes can lead to considerable variability in the RPA-speed trace depending on vehicle type as well as road and traffic conditions. The overview in Figure 5 clearly indicates the shortcomings of the NEDC: it completely excludes driving at low velocities and medium too high acceleration (RPA >0.2 m/s2) as well as at high velocities and low acceleration. The ongoing development of a world-wide harmonized driving cycle addresses parts these shortcomings; the new driving cycle well be implemented in the European Union by 2014 with the introduction of Euro 6 emission limits.

VW FOIA, EPA 06/20/2017 2017-FFP_027326

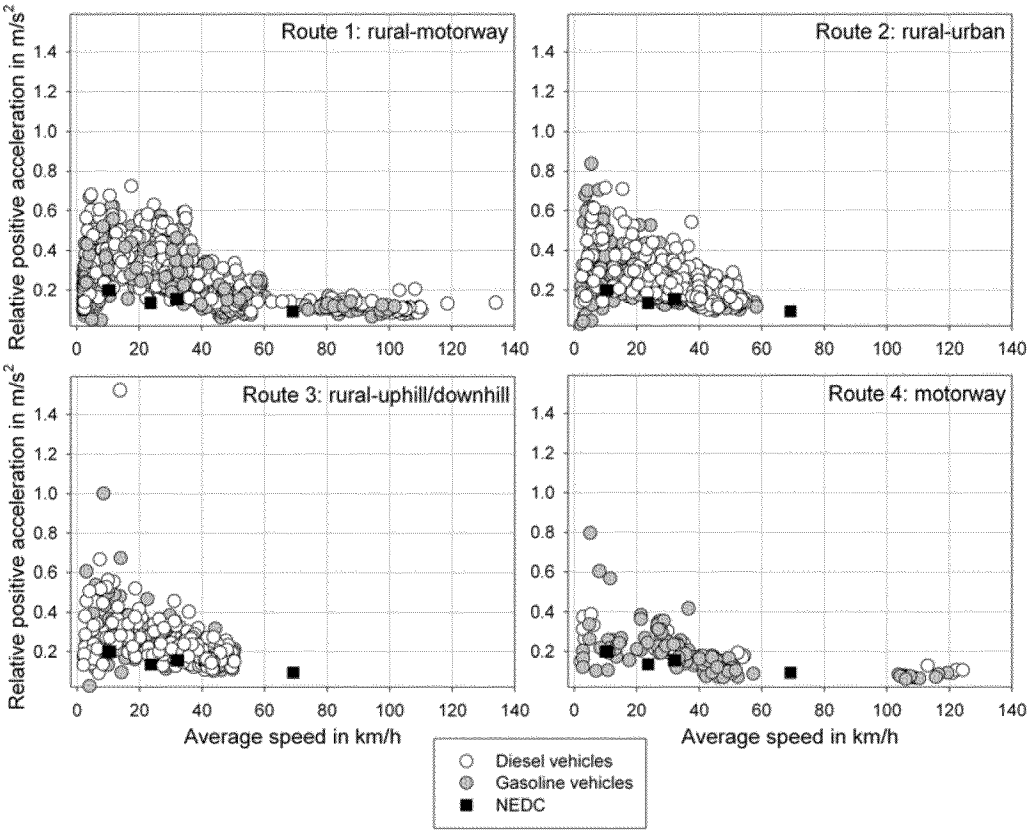

Figure 5: The relative positive acceleration of sub-trips composing the four PEMS test routes and the NEDC

Regardless, also the driving on the four PEMS test routs has one particular limitation: It is not able to reproduce driving at very high speeds (i.e., >140 km/h) as it frequently occurs on the German Autobahn. This limitation is relevant because Germany presents the largest vehicle market in Europe and operates an Autobahn network of more than 12,000 km, which accounts for one third of all vehicle-kilometres driven in Germany. Large parts of the Autobahn are free of a speed limit. In 1995, the average vehicle speed on the Autobahn was 134 km/h (Pander, 2007) and thereby higher than the speed limit enforced in all other European countries[3].

3.3 PEMS equipment and test protocol

For the emissions testing of light-duty vehicles, a Semtech-DS PEMS from Sensors Inc. was used. This equipment is commercially available and consists of a tail-pipe attachment, heated exhaust lines, a Pitot tube for measuring the exhaust mass flow and temperature, exhaust gas analyzers, a data logger to the vehicle network, a GPS, sensors for ambient temperature and humidity, and exhaust pipelines (Figure 6). The mass of the PEMS systems including an external battery for power supply amounts to 80 kg and is thereby equivalent to the mass of a passenger. PEMS accounts at maximum for 9% of the mass of tested vehicles. Although the mass of the PEMS equipment might not substantially affect the test results, it may introduce a bias into the emission measurements. This bias may, however, allow reproducing on-road emissions of with more than one person in the vehicle.

VW FOIA, EPA 06/20/2017 2017-FFP_027327

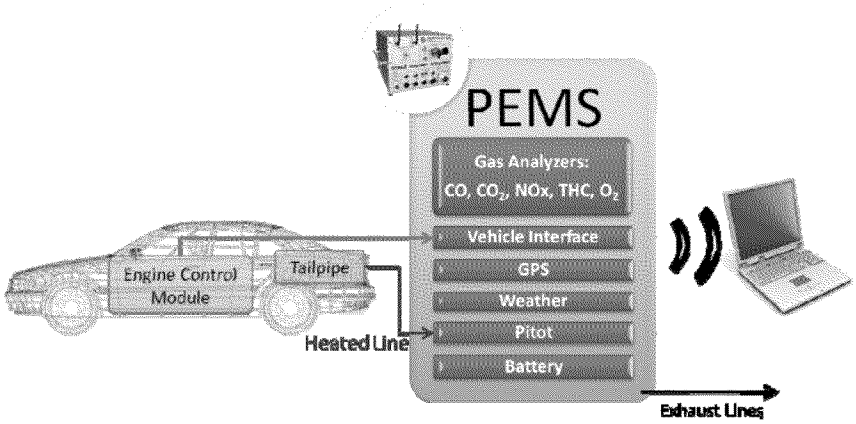

Figure 6: Schematic overview of PEMS and auxiliary components (courtesy Sensors Inc.)

PEMS measures the exhaust gas concentrations of the regulated pollutants THC, CO, and NO_X, as well as of CO_2 and NO emissions, the exhaust mass flow and the exhaust temperature. The complete set of parameters measured with PEMS during on-road emission tests, as well as the corresponding measurement technique, is provided in Table 5. Total hydrocarbon emissions are measured by a heat flame ionization detector (HFID); CO and CO_2 emissions are measured by a non-dispersive infrared (NDIR) analyzer; NO and NO_2 emissions are measured by a non-dispersive ultraviolet (NDUV) analyzer; the total NO_X emissions are then calculated from the NO and NO_2 data. Particulate matter (PM) is excluded from this analysis.

Table 5: Overview of parameters measured with PEMS

Category	Parameter	Measurement technique
Exhaust gas pollutants	THC	HFID
	CO	NDIR analyzer
	CO_2	NDIR analyzer
	NO and NO_2	NDUV analyzer
	Exhaust flow rate	EFM
	Exhaust temperature	EFM temperature sensor
Vehicle characteristics	Vehicle speed	GPS
	Vehicle position and altitude	GPS
	Acceleration	GPS
	Distance travelled	GPS
Ambient conditions	Elevation	GPS
	Ambient humidity	Humidity sensor
	Ambient temperature	Temperature sensor
	Ambient pressure	Pressure sensor

[3] Italy and Poland present exceptions: The speed limit on three-lane (six lanes in two directions) highways in Italy may be 150 km/h if indicated. The speed limit on highways in Poland will be 140 km/h from 2011 onward.

To measure the exhaust mass flow and exhaust temperature, the Semtech-DS uses an exhaust mass flow meter (EFM) equipped with differential pressure devices and thermocouples. The EFM has an accuracy of at least ± 3.0% at a resolution of 0.003 m^3/min and an exhaust temperature range from ambient to 550 ºC. The random error of PEMS measurements typically accounts for 2-3% of the measured value. The accuracy of PEMS has been verified against laboratory equipment by Rubino et al. (2007a). The verification tests were conducted on a 48 inches chassis dynamometer (MAHA; maximum power 150 kW; maximum velocity 200 km/h; inertia of 454-4500 kg) over the NEDC driving cycle. A Horiba MEXA-7400HTR-LE was used as reference for measuring NO_X, CO, HC, and CO_2 emissions. The NO_X emissions were measured using a chemiluminescence analyser (CLA; the total hydrocarbons emissions were measured by a heated flame ionization detector (HFID), CO and CO_2 were determined by NDIR analyzers. The CVS flow rate was set at 6 m^3/min. The gaseous emissions were measured during the emission tests according to the current European type-approval protocol. Good agreement was found between the emissions as measured with PEMS and the reference test cell analyzers (Horiba) as shown in Figure 7 (see also EPA, 2008; Rubino et al., 2007a,b). The deviations between both PEMS and laboratory equipment are negligible with respect to the findings of this report.

The test protocol of the Semtech-DS PEMS for measuring on-road emissions of light-duty vehicles was adapted in two points from the one developed for heavy-duty vehicles (EUR, 2006c):

(i) The emissions were measured directly from cold start, including cranking.

(ii) The vehicle conditioning (e.g., the vehicle temperature) was monitored before, during, and after the test.

The main components of the Semtech-DS PEMS (i.e., pumps, electronic equipment, and analysers) were installed in the cabin of the vehicle, which avoids contamination, excessive vibrations, and heating of the equipment. The exhaust mass flow meters were attached to the vehicle's tailpipe; GPS and weather station were installed outside of the vehicle (Figure 8). The power for the analytical equipment was supplied by an external battery. This reduces the interference of PEMS with the engine operation and allows PEMS testing for up to 2.5 hours; the battery, nevertheless, introduces additional weight to the PEMS equipment. PEMS has been proven to yield reliable emission measurements in previous test campaigns for heavy-duty and light-duty vehicles (EUR, 2006a,b; Rubino et al., 2007a; Bonnel and Kubelt, 2010).

3.4 Data collection and analysis

3.4.1 Complementary data supply and emission tests

In addition to PEMS testing, the emissions of Vehicles A, D, and G-L were determined based on NEDC testing in the laboratory. All laboratory tests were conducted on a 48 inches (118 cm) chassis dynamometer produced by MAHA. A Horiba MEXA-7400HTR-LE was used as standard laboratory equipment for measuring THC, CO, HC, NO_X, and CO_2 emissions (see also Section 3.3). The vehicles that were tested based on the NEDC generally complied in the laboratory with the applicable emission limits.

For Vehicles B, C, E, and F no such NEDC tests were performed because in the early phase of the PEMS test campaign attention was predominantly paid on the reliability and completeness of PEMS measurements, rather than on establishing on-road emission values of light-duty vehicles in comparison to laboratory tests. The PEMS tests of the various vehicles were complemented as far as possible by vehicle data such as engine fuel rate [g/s], engine speed [rpm], or engine torque [Nm] obtained from the Engine Control Unit (ECU) via a data logger.

VW FOIA, EPA 06/20/2017 2017-FFP_027331

3.4.2 Data analysis

During the actual PEMS testing, each vehicle started from the JRC in Ispra (Italy) and returned to the JRC for technical checks, calibration, and data download. PEMS measures emissions with a time resolution of one second. Recorded emissions data were uploaded together with data from the PEMS's GPS system into EMROAD©, which is an Excel® tool developed by the JRC for analyzing and evaluating PEMS data (Kubelt and Bonnel, 2007). PEMS records uniformly NO_X emissions, which are uncorrected for ambient humidity and intake air temperature. This approach is justified by the aim of this project, i.e., to report on-road emissions as they occur under real-world driving conditions.

EMROAD© calculates first average emissions for the entire test route, expressed as grams per kilometre. EMROAD© also presents emissions in alternative metrics, e.g., as function of time or emitted CO_2 mass. These metrics will, however, not be discussed in detail because emission limits for light-duty vehicles are uniformly defined by EU legislation as distance-specific values in grams per kilometre (EC, 2007a).

To enable a more detailed analysis of emissions, EMROAD© allows calculating emission averages for individual averaging windows that represent sub-trips of a test route. This method is generally referred to as the averaging window method and represents an established methodology that will be used for the official emissions testing and characterization of Euro VI heavy-duty vehicles (EC, 2010). The method reduces fluctuations in the second-by-second emissions data and enables a more detailed understanding of emission variability in comparison to route averages. The principle approach is as follows: Pollutant emissions are averaged over intervals of a predefined duration. These intervals are referred to here as *averaging windows*. The duration of an averaging window is determined in the case of heavy-duty vehicles by a predefined quantity of work the vehicle's engine has performed until a certain point. This reference metrics is chosen because emission limits for heavy-duty vehicles are defined as work-specific quantities. In the case of heavy-duty vehicles both work-based averaging windows and applicable emission limits are therefore directly linked to an actual engine parameter (Kubelt and Bonnel, 2007; Bonnel and Kubelt, 2010; EC, 2010). In the case of light-duty vehicles emission limits are defined as distance-specific values (see Table 1). In line with the definition of emission limits (EC, 2007a), we chose in this report the distance travelled by the vehicle [km] as reference parameter to determine the length of an averaging window[4]. To make reference to the NEDC laboratory testing, the duration of a window is determined precisely as the distance travelled until the vehicle has emitted a cumulative mass of CO_2 that is equivalent to the CO_2 mass emitted during NEDC testing (see Table 3, column 8 from the left; Figures 9 and 10). This approach assures comparability of the distance-specific averaging window emissions with the Euro 3-5 emission limits. It is important to note that the CO_2 mass emitted presents a constant but the distance travelled by the vehicle may vary depending on the actual driving conditions. The averaging windows move at time increments equal to the data sampling period, i.e., one second. The distance *d* travelled during any averaging window is determined by:

$s = s_2 - s_1$, when (*Equation 2*)

$$m_{CO_2}(d_2 - \Delta s) - m_{CO_2}(s_1) < m_{CO_2,ref} \leq m_{CO_2}(s_2) - m_{CO_2}(s_1) \quad \text{(Equation 3)}$$

[4] The duration of averaging windows is generally longer than the one of sub-trips (see Section 3.2). On exception presents motorway driving, which typically is not interrupted by vehicle stops. Under such conditions, sub-trips might be extremely long, thus exceeding the length of an averaging window by several factors.

where: $m_{CO_2,ref}$ = total reference CO_2 mass [kg] determined during the NEDC test

$m_{CO_2}(s_1)$; $m_{CO_2}(s_2)$ = total CO_2 mass [kg] emitted until distance s_1 and s_2

Δs = distance travelled during the time increment of the sampling period of one second (Figure 10)

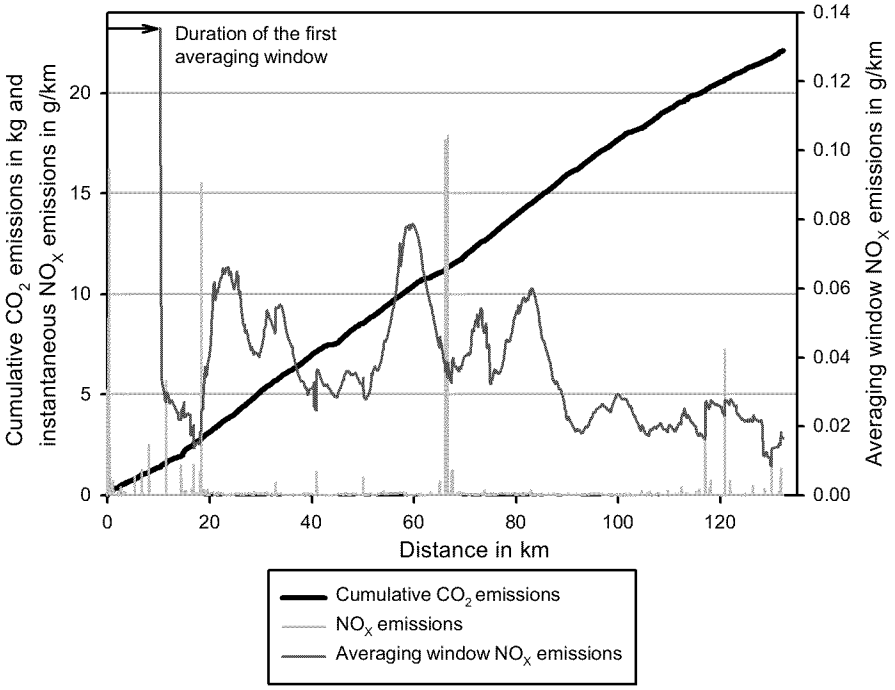

Figure 9: Example of the averaging window method for NO_X emissions; the first average is calculated once the vehicle has travelled a distance at which it has emitted a cumulative mass of CO_2 equivalent to the cumulative CO_2 mass emitted during a standard NEDC test; all consecutive windows move in increments of the sampling period, i.e., one second assuring that the cumulative CO_2 emissions match the reference CO_2 mass

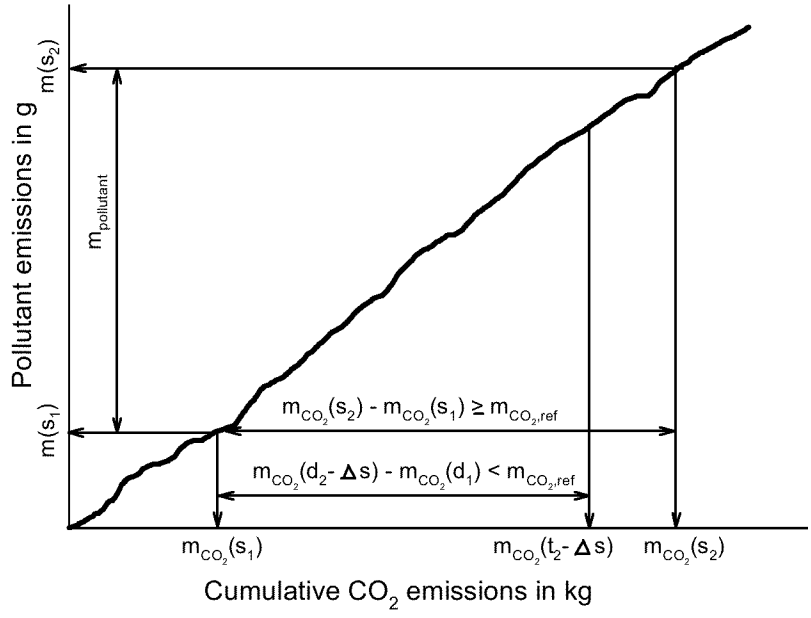

Figure 10: Schematic overview of the procedure to determine the duration of an averaging window with the CO_2 mass-based method

The CO_2 mass is calculated per window by integrating, i.e., adding the instantaneous CO_2 emissions measured with PEMS. In order to obtain a sufficient amount of data that can be used for analysis, a vehicle should emit during PEMS on-road testing at least a cumulative CO_2 mass that is equal to the cumulative CO_2 mass emitted during NEDC testing. For example, the first averaging window for Vehicle A (see Table 3) ends at a distance at which the vehicle has emitted cumulative CO_2 emissions of 2.00 kg; likewise, the averaging window for vehicle B (see Table 3) covers a distance equivalent to the cumulative CO_2 emissions of 1.86 kg. The averaging window method generally takes all measurements into account, thereby smoothing emissions data and reducing the interference of measurement spikes.

The applied averaging window method implies a peculiarity that deserves attention: The averaging window method gives unequal weight to emissions data because individual data points have different probabilities of belonging to a certain window. In particular emissions data obtained in the middle of a test procedure might be part of multiple windows where as emissions data in the beginning or at the end of an emissions test might be part of only one or a few averaging windows. This shortcoming is relevant for cold start emissions that are contained only in a few averaging windows, thus being underrepresented in the sample of averaging window emissions. We consider this problem minor with respect to the general findings of this report, in particular because cold-start emissions are specifically addressed in a separate section.

In line with Euro 3-5 emission limits, this report presents emissions uniformly in grams of per kilometre [g/km]. The presented uncertainty intervals for the route-specific average emissions indicate the maximum emissions measured over an entire test route. This approach is justified because for future emissions legislation it may be most relevant to obtain insight into the maximum level of emissions that might occur during on-road driving rather than into the overall variability of on-road emissions.

Next to presenting distance-specific emissions, also dimensionless deviation ratios (DR) are calculated. Deviation ratios present an indicator for the deviation between actual on-road emissions and the Euro 3-5 emission limits. The deviation ratio for each individual averaging window and each individual pollutant is defined as:

$$DR = \frac{DR_I}{DR_C} \qquad \text{(Equation 4)}$$

where DR_I = in-use deviation ratio
DR_C = certification deviation ratio

Both parameters are defined as:

$$DR_I = \frac{m}{s(t_2) - s(t_1)} \qquad \text{(Equation 5)}$$

$$DR_C = \frac{m_L}{s_{NEDC}} \qquad \text{(Equation 6)}$$

VW FOIA, EPA 06/20/2017 2017-FFP_027334

where: m = the mass of the respective pollutant emitted during one averaging window [g/window]

$s(t_2)$-$s(t_1)$ = the actual distance travelled by the vehicle during each individual averaging window [km/window]

m_L = the mass of the respective pollutant emitted during one NEDC driving cycle according to the Euro 3-5 emission limits [g]

s_{NEDC} = the reference distance of the NEDC driving cycle, i.e., 11.007 km

The reference pollutant mass of m_L differs depending on the applicable emission limit. The deviation ratios are calculated by using the travel distance as reference because emission limits for light-duty vehicles are defined as distance-specific values. The deviation ratios therefore differ from the so-called conformity factors that are used to characterize on-road emissions of heavy-duty vehicles by using engine work as reference quantity. The differences between both indicators and potential impacts on our results are discussed in Section 5.1.

To analyze the emission performance of vehicles under cold-start conditions, emissions during the first 300 seconds of each PEMS test were analyzed separately. During the cold start period, the various test routes differ in their characteristics only marginally from each other. Therefore, individual test routes were not differentiated. Instead average and maximum cold start emissions were calculated by combining the cold start sections of all test routes. The report continues with presenting the results of the on-road emissions testing with PEMS.

VW FOIA, EPA 06/20/2017 2017-FFP_027335

4 Results

This section presents the results of the PEMS test campaign for 12 gasoline and diesel vehicles that comply with Euro 3-5 emission limits. Special attention is paid to on-road emissions of Euro 5 vehicles because these vehicles are the most modern among the test vehicles and have to comply during NEDC testing with the currently enforced emission limits. This section continues by presenting on-road emissions for each vehicle as averages over the entire test routes (Section 4.1). Based on these results, Section 4.2 focuses in greater detail on NO_X emissions of Euro 5 vehicles, addressing in particular:

(i) the on-road emissions of Euro 5 vehicles in comparison to Euro 5 emission limits
(ii) on-road emissions of Euro 5 vehicles in comparison to Euro 3 and Euro 4 vehicles

Section 4.3 presents cold start emissions, i.e., emissions occurring during the first 300 seconds of the PEMS tests.

4.1 Average on-road emissions of light-duty vehicles

This section presents average emissions of NO_X, THC, CO, and CO_2 for the various light-duty vehicles and test routes. The average emissions are presented for each pollutant with two metrics as (i) distance-specific emissions [g/km] and (ii) dimensionless deviation ratios. The variability of emissions is indicated by error bars that present the maximum emissions measured for a vehicle on the various test routes. The PEMS results on NO_X emissions in Figures 11 and 12 show that:

(i) On-road NO_X emissions of gasoline vehicles generally stay within Euro 3-5 emission limits whereas NO_X emissions of diesel vehicles substantially exceed Euro 3-5 emission limits up to a factor of 2-4 if averaged over entire test routes.
(ii) On-road NO_X emissions show a relatively small decline from Euro 3 to Euro 5 diesel vehicles. This decline is substantially smaller than the stringency of Euro 3 to Euro 5 emission limits would suggest.
(iii) PEMS results suggest that there is no decline in the on-road NO_X emissions of Euro 3 towards Euro 5 gasoline vehicles.
(iv) On-road NO_X emissions are highest during extreme uphill-downhill driving and during driving on the Motorway at high velocities. This finding might be explained by insufficient exhaust gas recirculation at high engine loads during uphill and high-speed driving as well as decreased catalyst efficiency at cold start or during cool-down while down-hill driving and idling.
(v) The error intervals indicate substantial variability in the on-road NO_X emissions even if vehicles are driven on identical routes and thus under supposedly similar load pattern and driving conditions. This finding indicates the relatively high variability of on-road vehicle operating conditions.
(vi) Several diesel vehicles fail to meet the Euro 3-5 emission limits when tested with the NEDC; this finding might be partially attributed to deviations in chassis dynamometer settings and vehicle characteristics from type approval conditions.

VW FOIA, EPA 06/20/2017 2017-FFP_027336

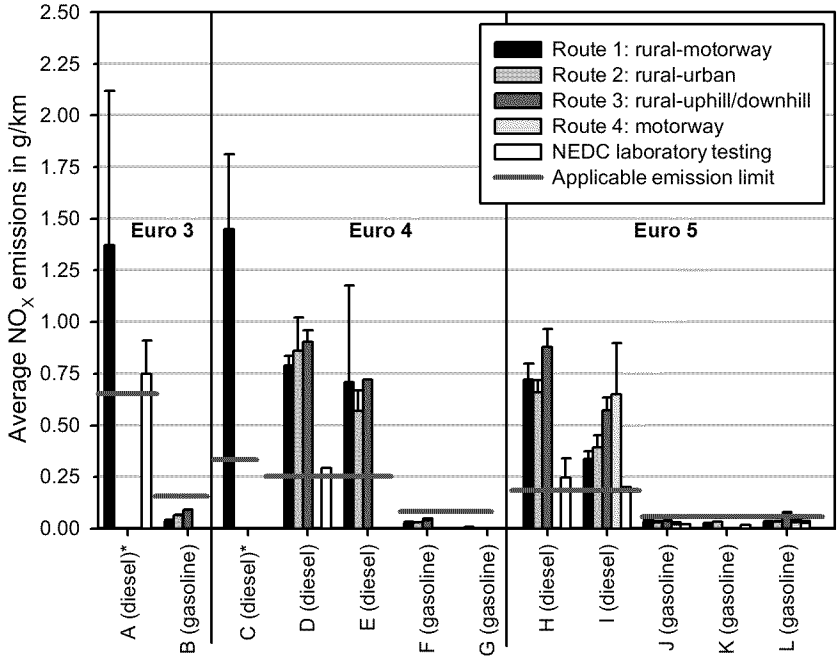

Figure 11: Average NO_X emissions on the PEMS test routes and during NEDC testing in the laboratory; uncertainty intervals indicate the maximum average emissions for each test and vehicle; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

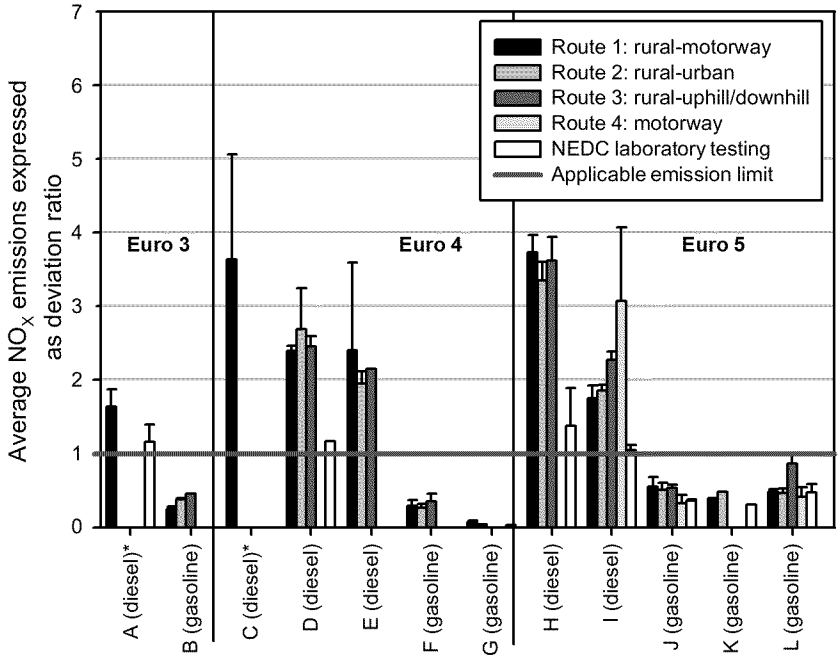

Figure 12: Average NO_X emissions on the PEMS test routes and during NEDC testing in the laboratory expressed as deviation ratio; uncertainty intervals indicate the maximum average emissions for each test route and vehicle; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

In summary, the PEMS results indicate that the increasing stringency of Euro 3 to Euro 5 emission limits did not lead to a substantial decline in the off-cycle on-road NO_X emissions of light-duty diesel vehicles. On-road NO_X emissions of current Euro 5 light-duty diesel vehicles might exceed

VW FOIA, EPA 06/20/2017 2017-FFP_027337

emission limits by up to a factor of four, depending on driving conditions. These results confirm earlier findings by Pelkmans and Debal (2006) and Vojtisek-Lom et al. (2009), who reported that NO_X emissions during off-cycle and on-road driving of five light-duty diesel vehicles substantially exceeded both Euro 3-4 emission limits. Overall, the results indicate that the standardized NEDC testing is clearly limited in capturing the diversity of emissions as they occur during on-road driving and may not fulfil the requirements defined by Regulation 715/2007 EC (2007a).

Of the total NO_X emissions, NO_2 is of particular interest because of its direct adverse environmental and health effects. The PEMS measurements indicate that:

(i) NO_2 emissions of gasoline vehicles are negligible in comparison to the emissions of diesel vehicles (Figures 13 and 14).

(ii) The share of NO_2 in the total NO_X emissions is substantially higher for diesel than for gasoline vehicles.

(iii) NO_2 might reach a share of up to 60% in the total NO_X emissions of diesel vehicles; the results do not allow drawing conclusions on whether this share increased from Euro 3 to Euro 5 vehicles.

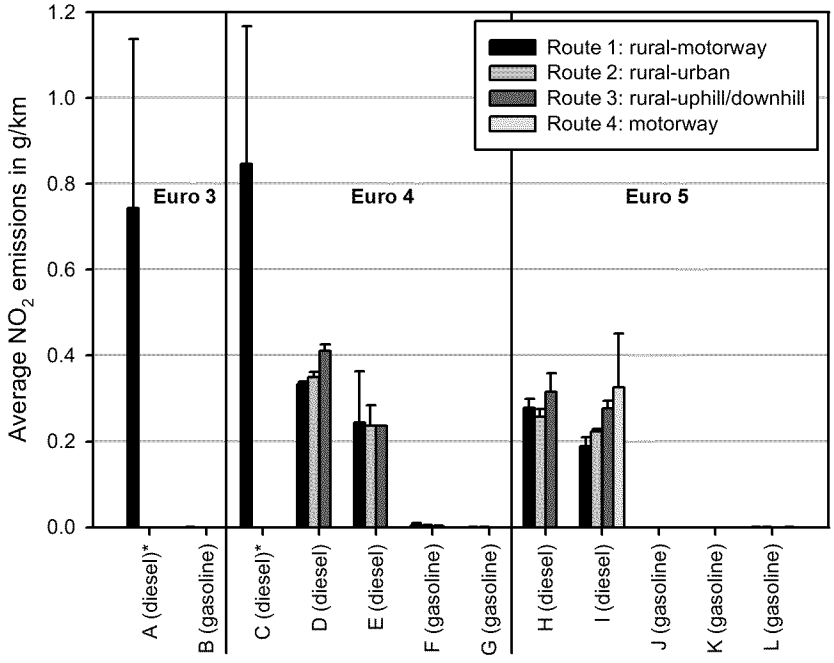

Figure 13: Average NO_2 emissions on the PEMS test routes; uncertainty intervals indicate the maximum average emissions for each test and vehicle; NO_2 was not measured during NEDC testing; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

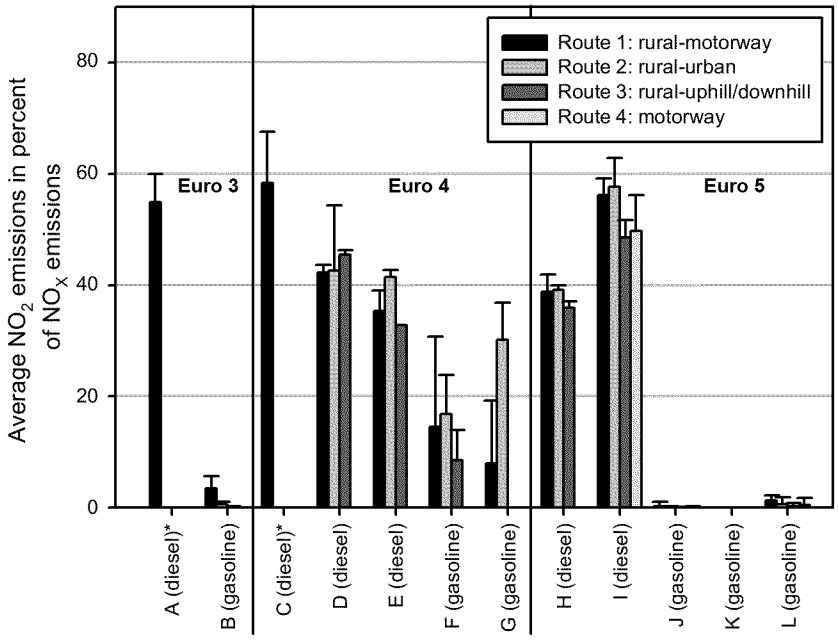

Figure 14: Average NO_2 emissions on the PEMS test routes expressed as percentage of average NO_X emissions; uncertainty intervals indicate the maximum average emissions for each test and vehicle; NO_2 was not measured during NEDC testing; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

In contrast to the on-road NO_X emissions, both on-road CO and THC emissions generally stay below Euro 3-5 emission limits. Figures 15 and 16 indicate that:

(i) On-road CO emissions of both diesel and gasoline vehicles generally stay below Euro 3-5 emission limits.

(ii) The results do not allow identifying a trend towards lower CO emissions from Euro 3 to Euro 5 diesel and gasoline vehicles.

(iii) The Euro 5 gasoline vehicle L shows exceptionally high emissions during extreme uphill-downhill as well as high-speed driving. The high CO emissions are associated with elevated THC emissions (see below) and high catalyst temperatures of up to 400 °C. The insufficient oxidation of carbon monoxide during uphill and high-speed driving points to insufficient catalytic conversion and requires further analyses.

VW FOIA, EPA 06/20/2017 2017-FFP_027339

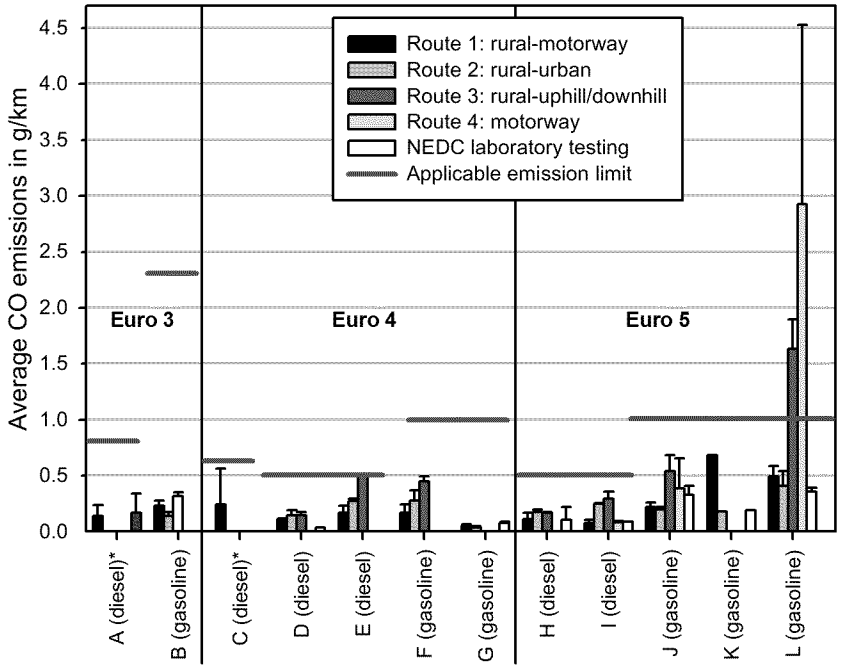

Figure 15: Average CO emissions on the PEMS test routes and during NEDC testing in the laboratory; uncertainty intervals indicate the maximum average emissions for each test route and vehicle; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

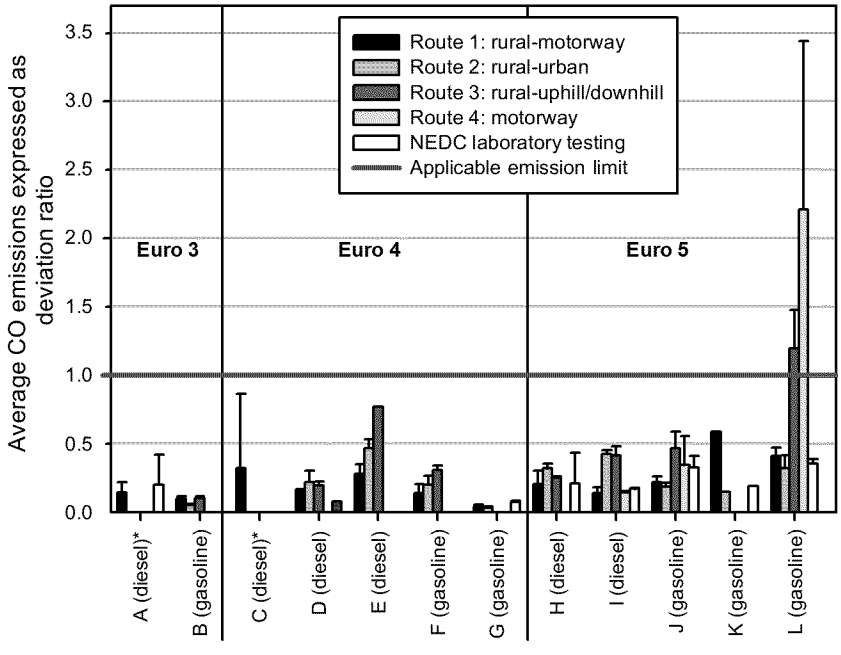

Figure 16: Average CO emissions on the PEMS test routes and during NEDC testing in the laboratory expressed as deviation ratio; uncertainty intervals indicate the maximum emissions for each test route and vehicle; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

The THC emissions of all diesel and gasoline vehicles remain below Euro 3-5 emission limits during the PEMS test campaign. The results can be summarized as follows (Figures 17 and 18):

(i) THC emissions of diesel and gasoline vehicles remain far below Euro 3-5 emission limits.

(ii) THC emissions generally increase from Euro 3 to Euro 5 gasoline vehicles both in absolute terms and as percentage of Euro 3-5 emission limits.

(iii) THC emissions of diesel and gasoline vehicles are generally higher during NEDC testing than they are on the road.

(iv) The Euro 5 gasoline Vehicle L shows higher THC emissions than all other test vehicles; the elevated emissions are associated with catalyst temperatures of up to 400 ^{O}C, suggesting low catalytic conversion rates.

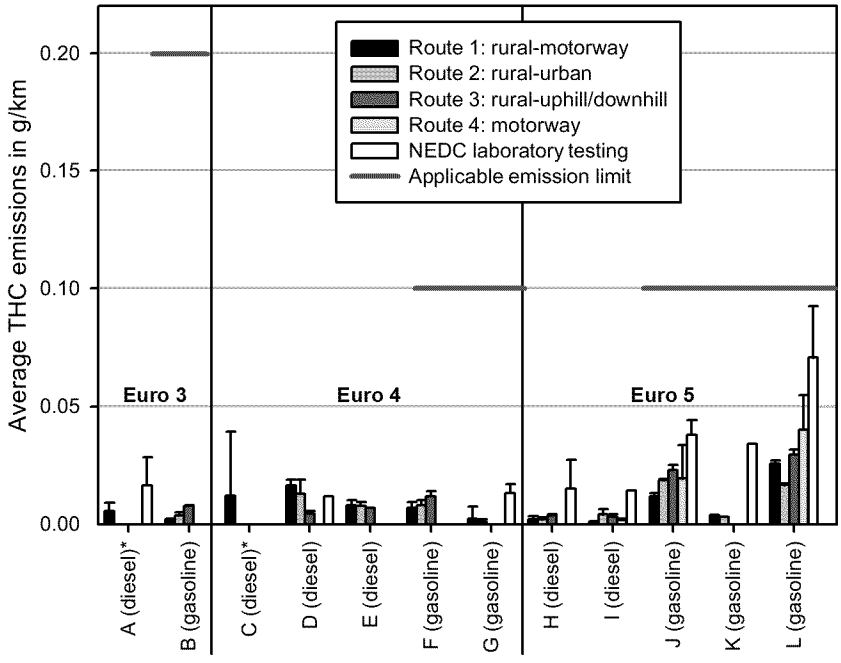

Figure 17: Average THC emissions on the PEMS test routes and during NEDC testing in the laboratory; uncertainty intervals indicate the maximum average emissions for each test route and vehicle; * Route 1: rural-motorway for Vehicles A and C (see Table 3) includes a combination of the two test routes Ispra-Milan-Ispra and Milan-urban

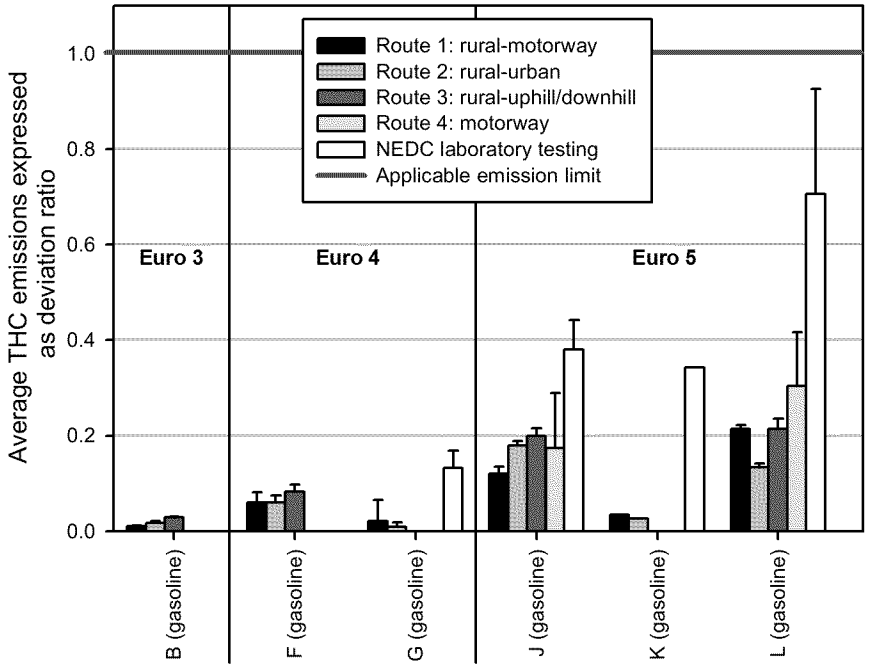

Figure 18: Average THC emissions on the PEMS test routes and during NEDC testing in the laboratory expressed as deviation ratio; uncertainty intervals indicate the maximum average emissions for each test route and vehicle

The PEMS measurements indicated so far that on-road NO_X emissions of diesel vehicles substantially exceed substantially Euro 3-5 emission limits, whereas on-road CO and THC emissions generally remain below the limits. Next to regulated pollutants, on-road CO_2 emissions are of particular interest to policy makers. To reduce greenhouse gas emissions from transport, the European commission sets a target of 130 g CO_2/km for new passenger cars of a reference mass of 1372 kg (EC, 2009a). For reasons of simplicity, we uniformly use here 130 g CO_2/km as benchmark for all test vehicles, thereby disregarding the specific mass of vehicles. The PEMS measurements indicate that (Figures 19-21):

(i) The average on-road CO_2 emissions of all vehicles tested on the four PEMS test routes amount to 176 ± 42 g/km. Diesel vehicles emit on average 189 ± 51 g/km, whereas gasoline vehicles emit 162 ± 29 g/km CO_2. Thus, on-road emissions substantially exceed the European Commissions fleet-average emissions target of 130 g/km (EC, 2009a).

(ii) The on-road CO_2 emissions of test vehicles exceed the emissions as specified during NEDC type approval by on average 21 ± 9%. Diesel vehicles show a deviation of 24 ± 8% and gasoline vehicles of 18 ± 10%. Still, these deviations might increase if vehicles are driven at extremely high speeds, e.g., as it frequently occurs on the German Autobahn.

(iii) The average CO_2 emissions during NEDC laboratory tests exceed the emission values as specified during NEDC type approval by 15 ± 10%. This deviation might be explained by differences regarding vehicle preparation (e.g., brand, dimension, air pressure of tyres, level of battery charge) as well as specific settings of the chassis dynamometer.

The report presented so far on-road emissions as averages over entire test routes. The next section analyzes in greater detail the on-road NO_X emissions of Euro 5 vehicles by making use of the averaging window calculations.

4.2 On-road NO_X emissions of Euro 5 light-duty vehicles

4.2.1 On-road NO_X emissions of Euro 5 vehicles versus Euro 5 emission limits

The results of the previous section indicate that on-road NO_X emissions of Euro 5 diesel vehicles may substantially exceed the Euro 5 emission limit. This section analyzes now in greater detail the NO_X emissions of Euro 5 vehicles with the averaging window method (see Section 3.4.2 for methodological details). The analysis shows that for almost any driving conditions the two tested Euro 5 diesel vehicles emit more NO_X than specified by the Euro 5 limit of 0.18 g/km (Figures 22-25). The key findings are:

(i) The average NO_X emissions of all averaging windows exceed the Euro 5 emission limit in the case of Vehicle H; the average NO_X emissions of at least 80% of the averaging windows exceed the Euro 5 emission limit in the case of Vehicle I, depending on the route driven.

(ii) Uphill/downhill driving on Route 3 is associated with particularly high NO_X emissions; the average NO_X emissions of all averaging windows for Vehicles H and I exceed the Euro 5 emission limit on this test route; roughly 20% of the averaging window emissions exceed the Euro 5 limit by more than 8 times. This finding points to fuel consumption, i.e., engine load as critical parameter determining the NO_X emissions of diesel vehicles.

(iii) The distribution of the averaging window NO_X emissions shows considerable variability, which is higher between different test routes than between individual tests on identical test routes.

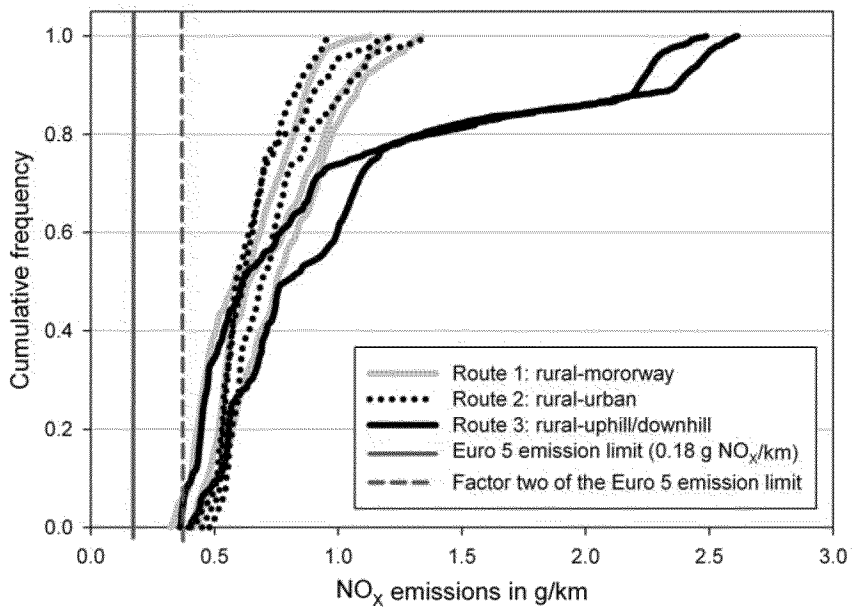

Figure 22: Averaging window NO_X emissions of EURO 5 diesel Vehicle H

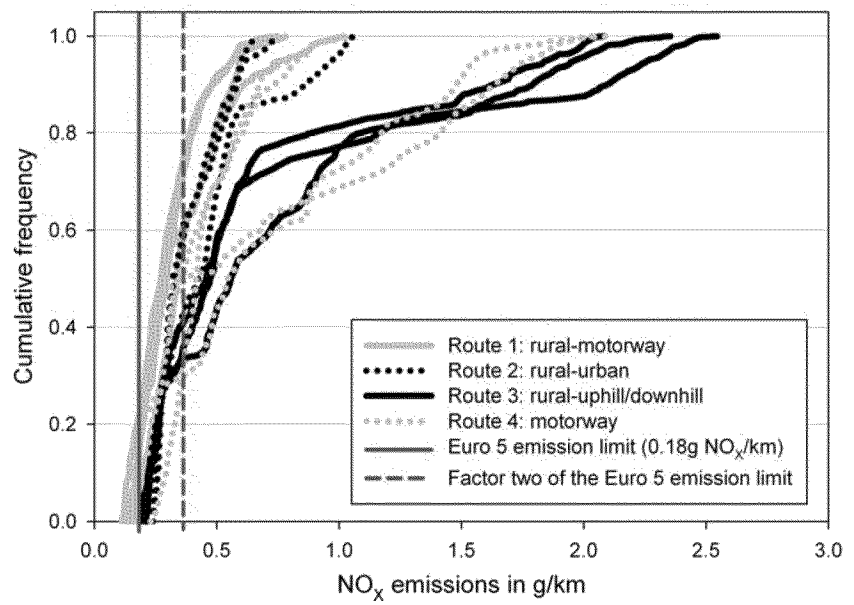

Figure 23: Averaging window NO_X emissions of EURO 5 diesel Vehicle I

VW FOIA, EPA 06/20/2017 2017-FFP_027345

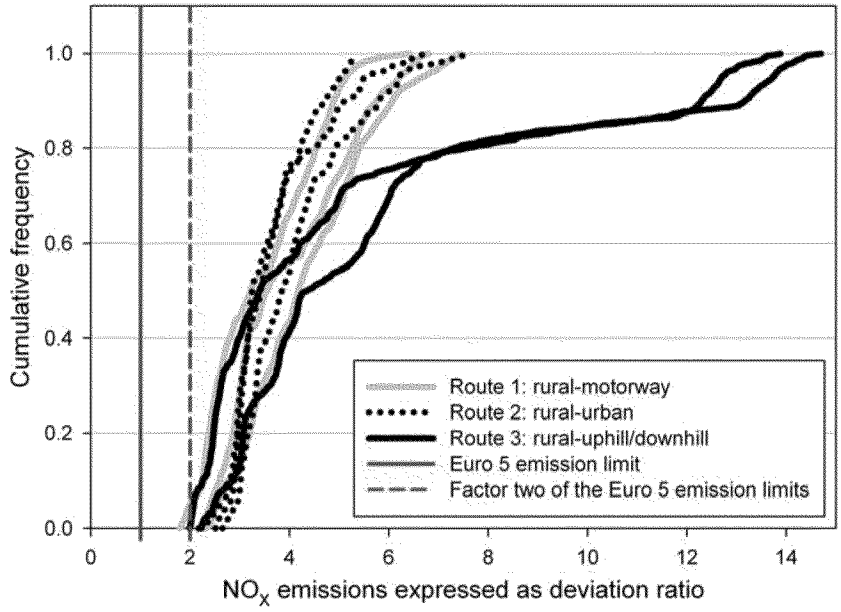

Figure 24: Averaging window NO_X emissions of EURO 5 diesel Vehicle H expressed as deviation ratio

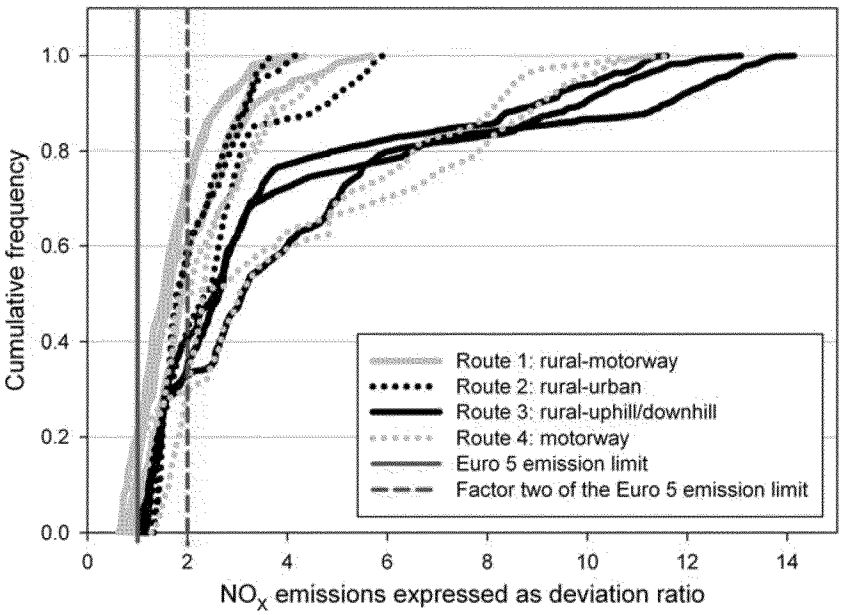

Figure 25: Averaging window NO_X emissions of EURO 5 diesel Vehicle I expressed as deviation ratio

In conclusion, the results indicate that the magnitude of NO_X emissions of Euro 5 diesel vehicles depends on vehicle velocity and operation mode but substantially exceeds under almost all on-road driving conditions the Euro 5 emission limit. This finding presents a sharp contrast to Euro 5 gasoline vehicles, for which NO_X emission remain for most of the averaging windows below the Euro 5 limit of 0.06 g/km (Figure 26). The key findings for Euro 5 gasoline vehicles are:

(i) NO_X emissions remain for the majority of averaging windows below the Euro 5 emission limit.

(ii) Even on the very severe Route 3, at maximum 40% of the averaging windows exceed the Euro 5 emission limit (Vehicle L). However, NO_X emissions of a very few averaging windows might exceed the limit by more than three times under these driving conditions.

(iii) Particularly high NO_X emissions occur at velocities higher than 120 km/h, under extreme uphill/downhill driving, during the cold-start phase, and during idling in urban driving. This finding points to fuel consumption (i.e., engine load) as well as catalyst temperature (which is low during cold start and might decline during long downhill and idling passages) as critical parameters for NO_X emissions. This finding further indicates, which driving pattern should be critically considered during type approval to achieve an effective reduction of on-road NO_X emissions.

(iv) The high NO_X emissions during low-velocity driving on Routes 1 and 2 are likely to be caused by both cold start and long idling periods. In the latter case, the catalyst cools down while the engine produces emissions although the vehicle's velocity is zero.

Caution is, however, required before drawing conclusions about the high emission levels of Euro 5 gasoline vehicles on Routes 1 and 2. Additional evaluation in Section 4.2.3 shall explore to which extent idling actually explains high NO_X emissions at low velocity and whether alternative metrics for data analysis should be employed to correct for the bias introduced by idling operation into the results.

VW FOIA, EPA 06/20/2017 2017-FFP_027347

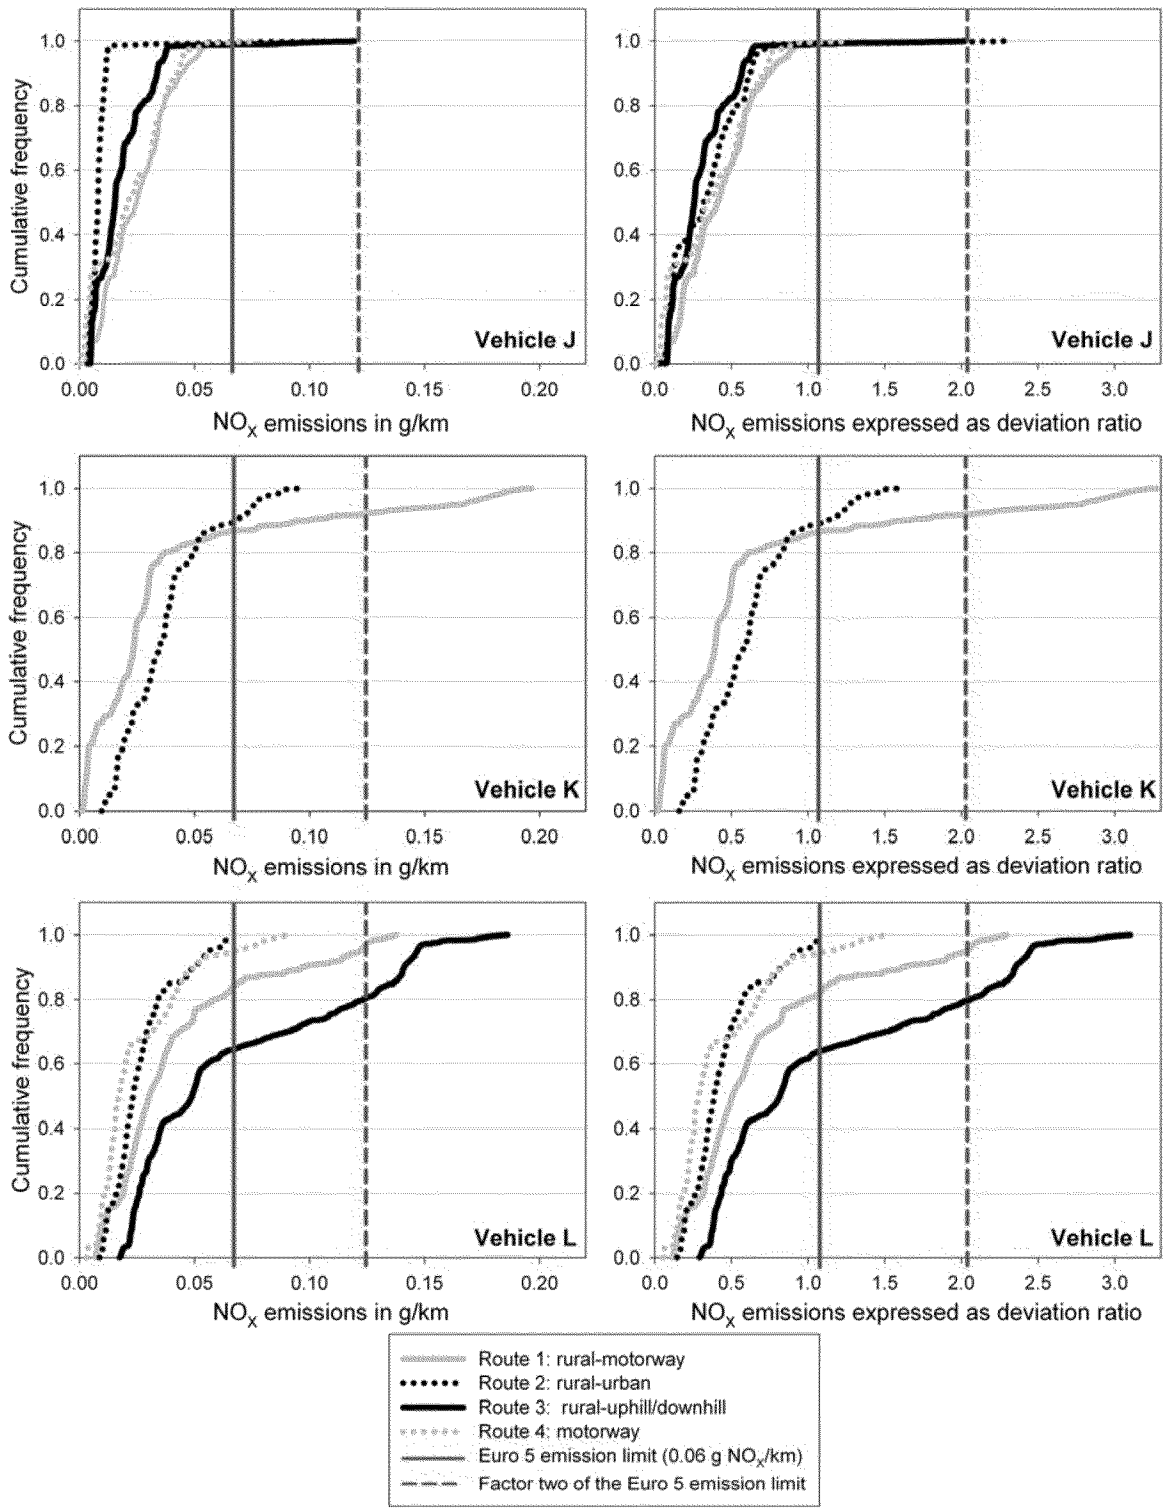

Figure 26: Averaging window NO_X emissions of Euro 5 gasoline vehicles; results given for only one randomly selected PEMS test for each vehicle and test route

4.2.2 Comparison of on-road NO_X emissions of Euro 3-5 vehicles

The previous section focussed solely on Euro 5 vehicles. This section now compares the averaging window NO_X emissions of Euro 3-5 vehicles based on one, randomly selected PEMS test per vehicle and test route (Figures 27 and 28). The findings are consistent with the route-average NO_X emissions identified in Section 4.1 and indicate that:

(i) Averaging window NO_X emissions of diesel vehicles in general substantially exceed the Euro 3-5 emission limit, while varying over a large range of values.

(ii) Averaging window NO_X emissions show a decline from Euro 3 to Euro 5 diesel vehicles, albeit at relatively large variability.

(iii) The highest averaging window NO_X emissions typically occur during demanding uphill/downhill driving on Route 3 and at high speeds on the motorway (Route 4).

By contrast, the findings for gasoline vehicles (Figure 28) indicate that:

(i) The majority of averaging window emissions remains below the Euro 3-5 emission limits although NO_X emissions vary over a large value range.

(ii) A few averaging windows substantially exceed the Euro 3-5 emission limits. These windows often include the cold-start, which is characterized by a low catalyst temperature and thus conversion efficiency.

(iii) The high emissions of Vehicle H on Route 3 present an exception among gasoline vehicles and warrant further and more detailed analyses.

In particular the results for gasoline vehicles indicate substantially elevated emissions during cold start. The next section addresses therefore cold-start emission in greater detail.

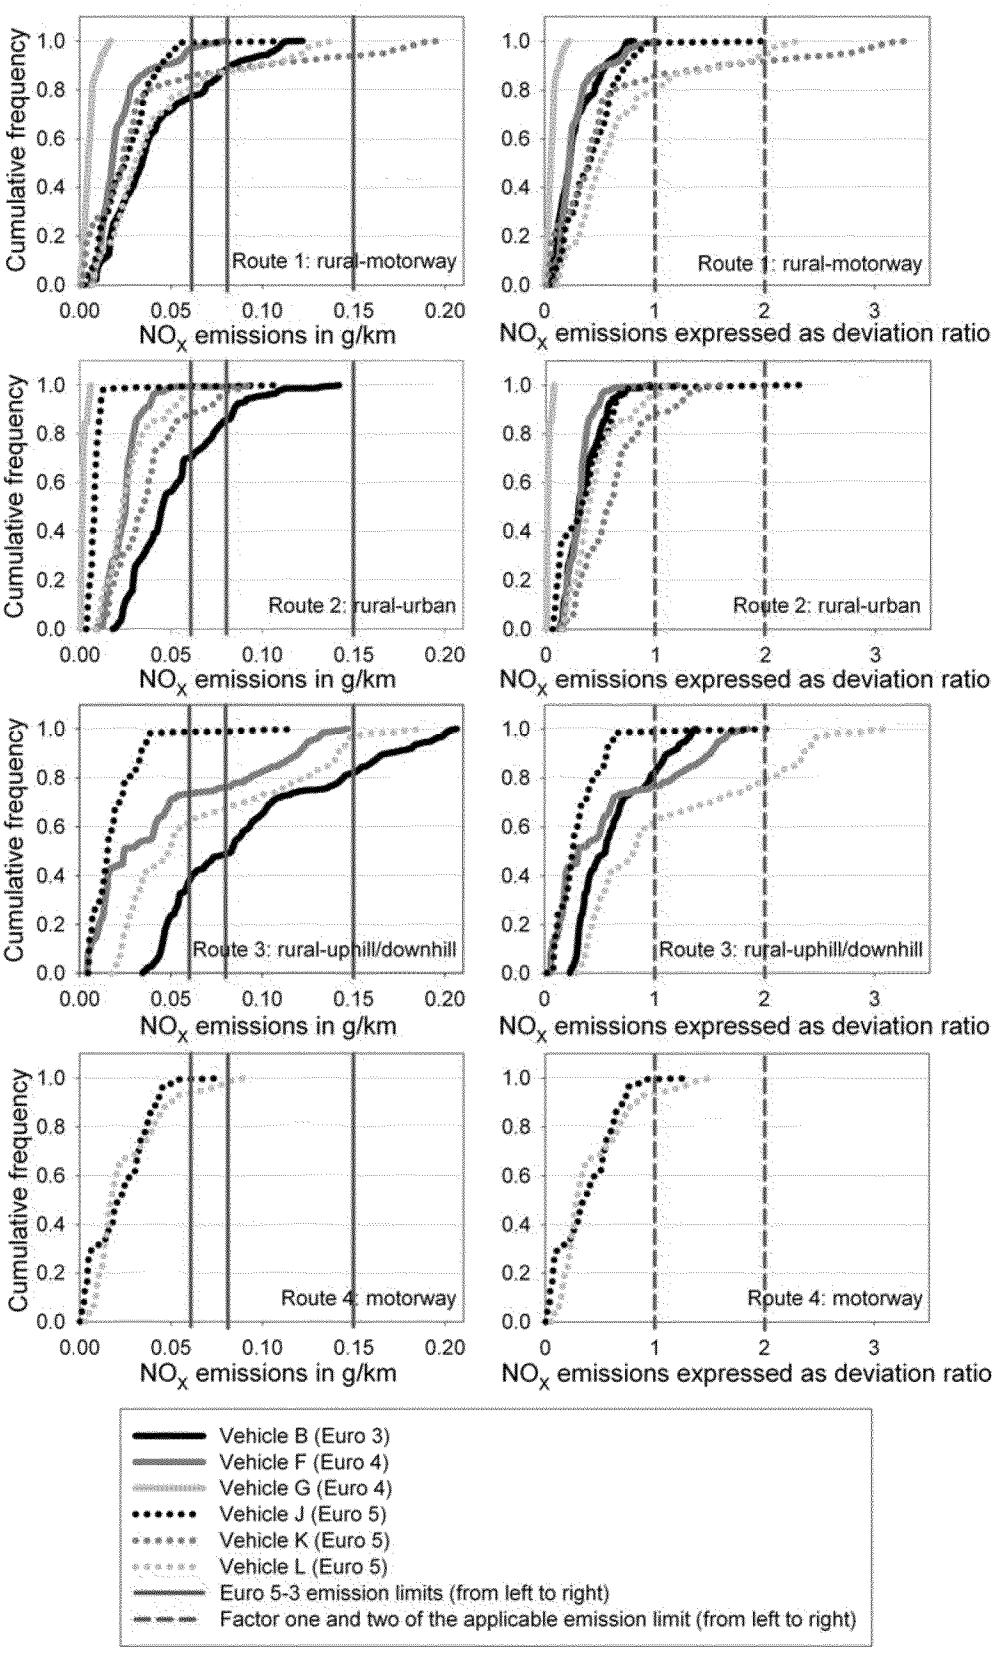

Figure 28: Comparison of the averaging window NO_X emissions of Euro 3-5 gasoline vehicles on the four PEMS test routes

VW FOIA, EPA 06/20/2017 2017-FFP_027351

4.3 Cold start emissions

Low catalyst temperatures typically limit the effectiveness of the catalytic conversions during cold start. Cold start emissions are of particular interest because these generally occur in urban areas and might substantially exceed average on-road emissions levels. The analysis of cold-start emissions focuses on the first 300 seconds of each PEMS emissions test. The various test routes were not differentiated because driving conditions are relative similar during this initial time period for all test routes. Cold-start emissions are presented in the following for each light-duty vehicle individually as averages over all four test routes (Figures 29 and 30).

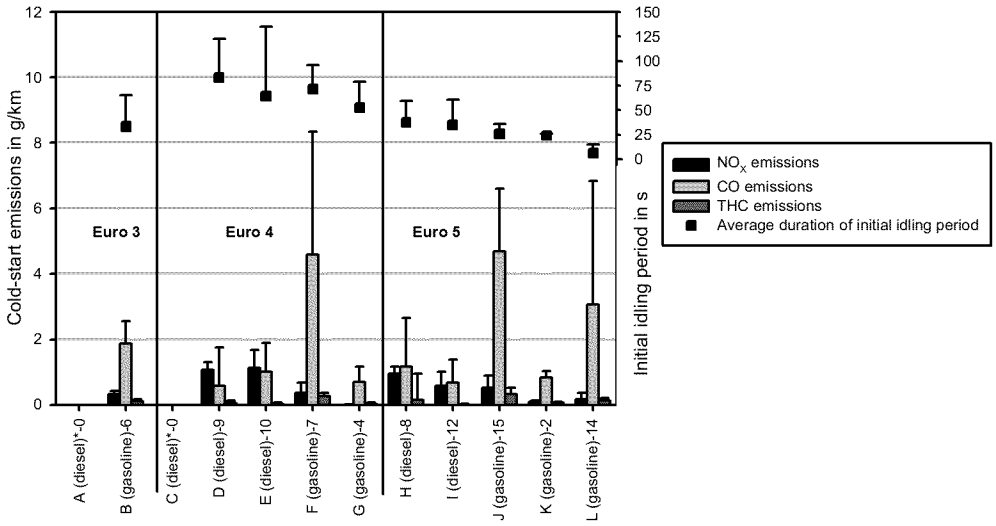

Figure 29: Average cold-start emissions and initial idling periods of light-duty vehicles; numbers below the x-axis indicate the amount of individual PEMS tests included in this analysis; uncertainty intervals indicate the maximum cold-start emissions identified for each respective vehicle; * Vehicles A and C (see Table 3) are excluded because the driving distance during the cold-start period could not be retrieved from the GPS system

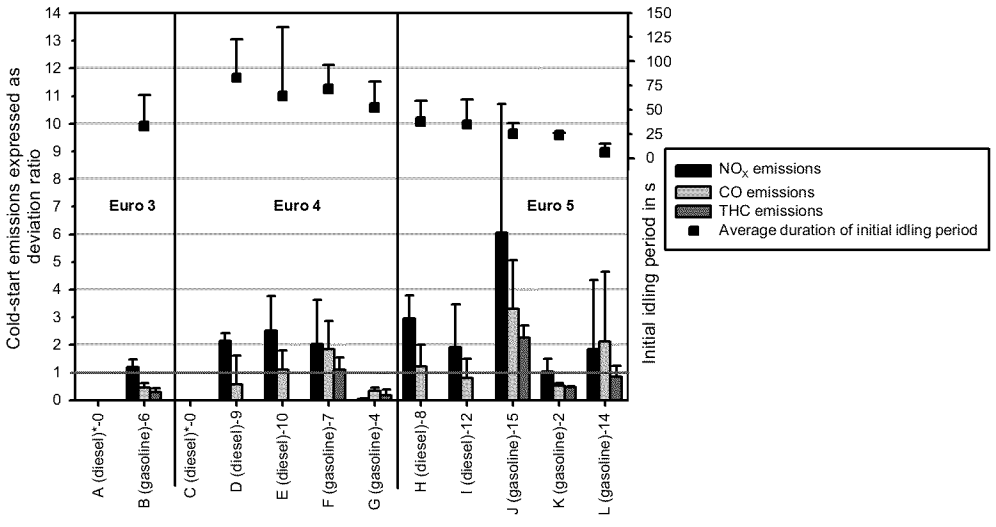

Figure 30: Average cold-start emissions expressed as deviation ratio and initial idling periods of light-duty vehicles; numbers below the x-axis indicate the amount of individual PEMS tests included in this analysis; uncertainty intervals indicate the maximum cold-start emissions identified for each respective vehicle; * Vehicles A and C (see Table 3) are excluded because the driving distance during the cold-start period could not be retrieved from the GPS system

The results presented in Figures 29 and 30 can be summarized as follows:

(i) The data do not indicate a trend towards lower cold-start emissions from Euro 3 to Euro 5 diesel and gasoline vehicles.

(ii) Cold-start emissions of both diesel and gasoline vehicles generally exceed Euro 3-5 emission limits. Cold-start NO_X emissions are always higher than the Euro 3-5 limits; CO emissions often exceed the emission limits; THC emissions are both below and above the Euro 3-5 limits.

(iii) Cold-start emissions are slightly higher than the average on-road emissions in the case of NO_X but substantially exceed the average on-road emissions in the case of CO and THC.

(iv) Cold-start emissions of individual vehicles span over a relative large value range. This suggests that environmental conditions (e.g., lower or higher ambient temperatures) in combination with changing driving pattern (e.g., longer or shorter idling periods) might substantially affect the results. In particular the duration of initial idling periods might have a substantial effect on the distance-specific cold-start emissions. More detailed analysis is warranted to quantify the magnitude of this effect on the results presented in Figures 29 and 30.

More detailed insights into cold-start emission pattern can be obtained by plotting both emissions and tailpipe temperature as function of time (Figures 31 and 32). The examples of diesel Vehicle H and gasoline Vehicle L indicate that pollutant concentrations in the exhaust are often particularly high directly after the start of the engine. At this point, exhaust and catalyst temperatures are particularly low, causing a low efficiency in the oxidation of CO and THC. The NO_X concentrations in the exhaust of diesel Vehicle H show large fluctuations but no obvious temperature dependency in the cold start phase. This finding results from the absence of catalytic NO_X oxidation in the emissions treatment system. By contrast, NO_X concentrations in the exhaust of gasoline Vehicle L decline directly after engine start. This finding points again to the temperature-dependent efficiency of three-way catalysts in gasoline vehicles.

5 Discussion

5.1 Data analysis and results

The on-road PEMS measurements indicate that in particular on-road NO_X emissions of light-duty diesel vehicles substantially exceed the Euro 3-5 emission limits, whereas on-road CO and THC emissions generally remain below the Euro 3-5 emission limits. These findings can be regarded as reliable and robust. Interpreting the deviation ratios of averaging window emissions, however, deserves special attention because this parameter differs from the so-called conformity factor that is used to characterize emissions of heavy duty vehicles (EC, 2010). First we reiterate the methodology for calculating both deviation ratios and conformity factors. Afterward, a comparison of deviation ratios and conformity factors calculated as a sample case for the averaging window emissions of one selected light-duty vehicle is presented.

Section 3.4.2 describes in detail the methodology for calculating deviation ratios. Conformity factors are calculated based on a similar method, with the exception that now engine work is used as reference quantity instead of travel distance as it is the case for deviation ratios (see Section 3.4.2). This approach is chosen to assure consistency with both the method used to define the duration of averaging windows and the definition of emission limits for heavy-duty vehicles (Bonnel and Kubelt, 2010; EC, 2009b, 2010).

To analyze the differences between the two parameters, also conformity factors for one light duty vehicle were calculated as a sample case. For this calculation, we approximate engine work by the CO_2 mass emitted. Per definition, the cumulative CO_2 mass emitted during one averaging window equals the cumulative CO_2 mass emitted during a standard NEDC test. Therefore, the conformity factor simplifies in this sensitivity analysis to the quotient of measured averaging window emissions and the respective Euro 5 emission limit (see also Equations 3-5 in Section 3.4.2):

$$CF = \frac{CF_I}{CF_C} = \frac{\frac{m}{m_{CO_2}(t_2) - m_{CO_2}(t_1)}}{\frac{m_L}{m_{CO_2;NEDC}}} = \frac{m}{m_L} \text{ ,if} \qquad \text{(Equation 7)}$$

$$m_{CO_2}(t_2) - m_{CO_2}(t_1) = m_{CO_2;NEDC} \qquad \text{(Equation 8)}$$

where:
- CF = conformity factor
- CF_I = in-use conformity factor
- CF_C = certification conformity factor
- m = mass of emissions; indices having the same meaning as in Equations 3-5

Based on this calculation, it is now possible to understand the difference between deviation ratio and conformity factor: In the case of the deviation ration, the distance driven by a vehicle on the road most likely differs from the distance of the NEDC cycle, even if the CO_2 masses on-road and during NEDC testing are identical. For example, if a vehicle is driven on the challenging uphill/downhill Route 3, it might consume more fuel, thus emit more CO_2 than under NEDC condition,

and thus travelling a shorter distance until it has emitted a CO_2 mass equivalent to the one emitted during NEDC testing. In such a case, the deviation ratio increases by the fraction of window distance to NEDC distance. Consequently, it is precisely this fraction between window distance and NEDC distance that represents the difference between deviation ratio and conformity factor. Since the measured on-road fuel consumption and the associated CO_2 emissions exceed the CO_2 emissions during NEDC testing by on average 21 ± 9% (see Section 4.1) it can be expected that the deviation ratio generally exceeds the conformity factor. Figure 33 indicates that this is indeed the case in our sample analysis for Vehicle L.

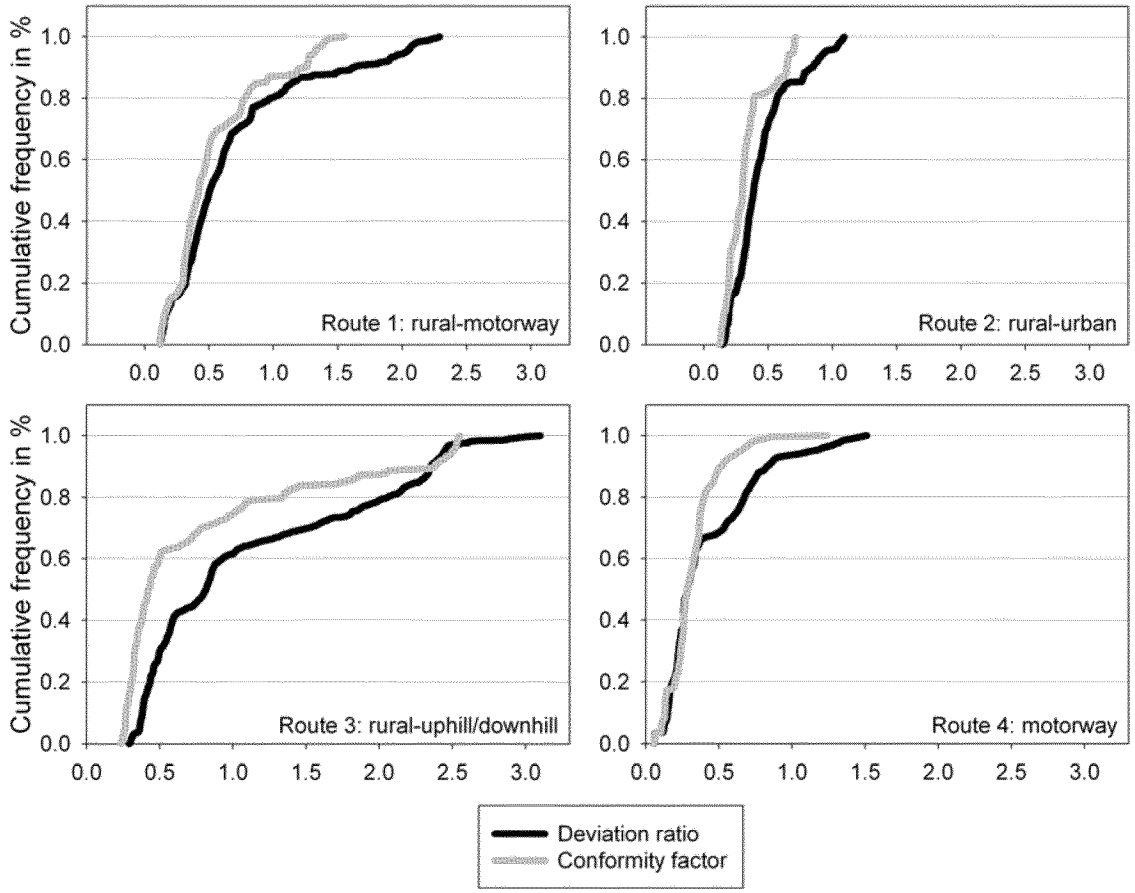

Figure 33: Cumulative frequency distribution of averaging window NO_X emissions of Vehicle L expressed as deviation ratio and conformity factor

By focusing in detail on Route 1, the data furthermore indicate that both deviation ratio and conformity factor of averaging window NO_X emissions show a positively skewed distribution (Figure 34). The peak of the frequency distribution of deviation ratios is located at 0.37, whereas the peak of the distribution of conformity factors is located at 0.28. A similar pattern can also be expected for other vehicles and pollutant emissions. This finding indicates that the majority of emissions are slightly lower than the average, while for a minority averaging windows, emissions are substantially elevated.

The distinct properties of deviation ratio and conformity factor suggest that both parameters should serve slightly different purposes:

VW FOIA, EPA 06/20/2017 2017-FFP_027357

(i) The deviation ratio is best used to indicate the ratio of distance-specific emissions to distance-specific emission limits as specified for light-duty vehicles.

(ii) The conformity factor serves best to compare work-specific emissions with work-specific emission limits as specified for heavy-duty vehicles.

The conformity factor is independent of distance; it may therefore provide a robust evaluation of emissions during long idling periods. In the case of idling, the distance travelled during in an averaging window may decrease substantially and theoretically lead to a considerable increase in the deviation ratio. This problem links to the shortcoming of a distance-specific definition of emission limits for light-duty vehicles that does not permit to link emissions to actual engine parameters.

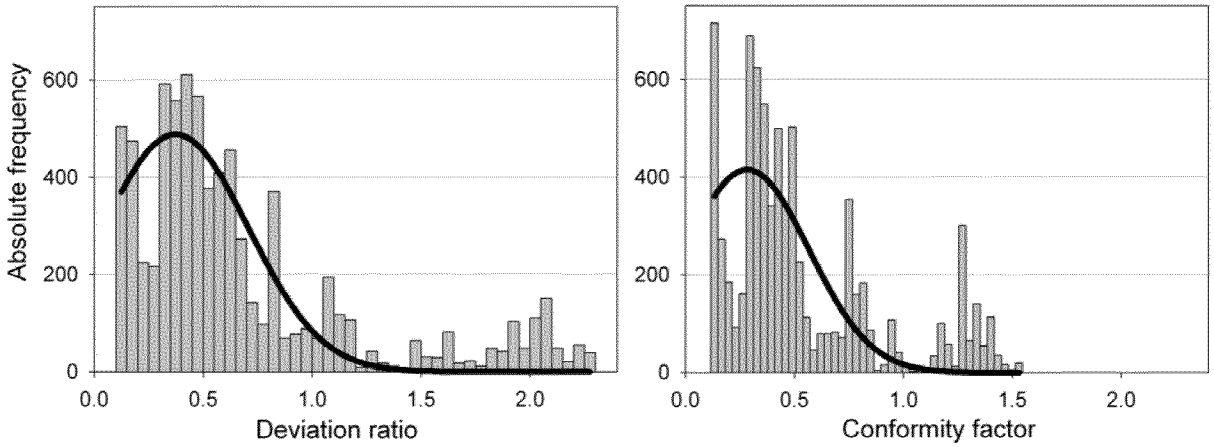

Figure 34: Cumulative frequency distribution of averaging window NO_X emissions of Vehicle L on test Route 1 expressed as deviation ration and conformity factor

On-road emissions testing with PEMS allows covering a large variety of driving conditions and is typically characterized by a high degree of randomness and limited repeatability. The variability in road, weather, and traffic conditions as well as the drivers' behaviour attribute to every on-road PEMS test quasi unique characteristics. Nevertheless, these characteristics open the possibility for limiting on-road PEMS tests to a very narrow range of normal driving conditions, e.g., with the aim of achieving extremely low emission values. Given this limitation, it is imperative:

(i) to continue using a standardized laboratory emissions test procedure that yields comparable and reproducible emission results

(ii) to supplement this procedure by test procedures that capture a wider range of potential on-road emissions

(iii) to define general criteria for conducting on-road PEMS tests

VW FOIA, EPA 06/20/2017 2017-FFP_027358

5.2 Potentials of PEMS-based emission test procedures

The present test campaign revealed the strengths and weaknesses of PEMS. In view of developing supplementary emission test procedures for light-duty vehicles, these can be summarized as follows:

Strengths:

(i) PEMS measures real emissions from actual on-road driving.

(ii) PEMS can assure the proper design and operation of emission control technologies as well as the vehicle's energy consumption under a wide variety of normal operating conditions.

(iii) PEMS is suitable to test emissions from novel engine/after-treatment/powertrain technologies (e.g., parallel/serial (plug-in) hybrids or electric vehicles) as well as from alternative fuels.

(iv) PEMS provides measurements that can serve as basis for not-to-exceed emission limits, i.e., emission levels that should not be exceeded, regardless of driving and ambient conditions.

Weaknesses:

(i) PEMS generally allow only to a very limited extent to reproduce and compare individual test results due to the variability of on-road ambient and driving conditions.

(ii) PEMS allow only to a limited extent to reproduce cold start emissions.

(iii) The power consumption of PEMS is typically supplied by auxiliary batteries in order not to interfere with the vehicle operation. However, the weight of batteries and analytical equipment of approximately 80 kg may introduce a bias in emission measurements, especially if conducted for small vehicles equipped with small engines. Potentials for weight reductions of the equipment exist as technological improvements of the test equipment are very likely (both in terms modularity and size).

Several practical considerations might support or limit the application of PEMS:

(i) PEMS allows for relatively long test campaigns of 2 hours duration.

(ii) PEMS test procedures and equipment has been developed for testing the in-service conformity of heavy-duty vehicles and non-road machinery and has been proven to be reliable also for light-duty vehicles.

(iii) The modular composition of PEMS allows for limiting the emissions screening to an absolute minimum. For instance, the THC measurements with an FID analyser (which has high power consumption and requires a hydrogen/helium mixture) could be abolished because the correct functioning of oxidation and three-way catalysts can also be verified by analysing CO emissions only. Such an approach would reduce the weigh of the PEMS equipment substantially.

(iv) PEMS testing requires no detailed prescription of driving and ambient conditions; a prescription of key-features of test routes (e.g., percentage of driving in city, motorway, test duration, road slope, drivers' behaviour) is, nevertheless, recommended to assure that PEMS testing covers as far as possible the large spectrum of driving conditions as it occurs during normal conditions of vehicle use.

VW FOIA, EPA 06/20/2017 2017-FFP_027359

6 Conclusions

This report analyzes the on-road emissions of twelve light-duty diesel and gasoline vehicles by using Portable Emission Measurement Systems (PEMS). The analyses were conducted for Euro 3-5 light-duty vehicles in the period between 2007 and 2010 on four test routes comprising rural, urban, uphill/downhill, and motorway driving.

The average NO_X emissions of all tested diesel vehicles over the entire test routes amount to 0.93 ± 0.39 g/km; the average NO_X emissions of the tested Euro 5 diesel vehicles reach 0.62 ± 0.19 g/km. These results indicate that NO_X emissions of light-duty diesel vehicles substantially exceed the Euro 3-5 emission limits: by a factor of 4-7 as averages over entire test routes and up to a factor of 14 for individual averaging windows. The increasing stringency of European emission limits has, thus, not resulted in an equivalent reduction of on-road NO_X emissions of light-duty diesel vehicles. By comparison, on-road NO_X emissions of gasoline vehicles as well as CO and THC emissions of diesel and gasoline vehicles generally stay within Euro 3-5 emission limits. The share of NO_2 in the total NO_X emissions reaches 60% for diesel vehicles but only 0-30% for gasoline vehicles. The tested light-duty diesel and gasoline vehicles emit on average 189 ± 51 g CO_2/km (grams of carbon dioxide per kilometre) and 162 ± 29 g CO_2/km, respectively during on-road testing, thereby exceeding the CO_2 levels as specified during NEDC testing of the respective vehicles by on average 21 ± 9%. The magnitude of all pollutant emissions varies depending on vehicle, operation mode, route characteristics, and ambient conditions. Cold-start emissions of both diesel and gasoline vehicles span over a large value range; NO_X emissions exceed Euro 3-5 emission limits by a factor 2-14, CO emissions often exceed the Euro 3-5 limits, and THC emissions are both below and above the limits.

In conclusion, the PEMS results indicate that on-road NO_X emissions of light-duty diesel vehicles differ substantially between laboratory NEDC testing and actual on-road driving. While the standardized laboratory NEDC emissions testing yields comparable and reproducible results, the procedure may fail to capture the potential range of on-road emissions. To solve this shortcoming, Regulation 715/2007 (EC, 2007a) envisages supplementing the standard laboratory emissions testing with suitable complementary test procedures. Such complementary procedures may then also address particularly polluting driving modes, which cannot be simulated in the laboratory such as (i) extreme high speed driving as it frequently occurs on the German Autobahn and (ii) vehicle operations associated with relatively low or high temperatures of the aftertreatment systems. Without covering such a wide range of normal operating conditions, a reduction of on-road emissions, and specifically NO_X emissions, may remain punctual.

The PEMS equipment is able to provide reliable and accurate on-road emission measurements for light-duty vehicles, even for vehicles that will be certified according to future emissions standards. This makes PEMS a suitable tool for identifying and updating emission factors of air pollution models. Furthermore, PEMS may be used as supplemental emission test procedure next to standardized laboratory emission tests. The strengths of PEMS include the ability to detect the proper operation of emission control technologies under a wide variety of normal operating conditions, in particular during high-speed driving at speeds above130 km/h as it frequently occurs on the German Autobahn. PEMS also allows testing emissions from novel fuel/engine/after-treatment/powertrain technologies (e.g., parallel/serial (plug-in) hybrid vehicles. Such analyses have not been conducted yet but are envisaged for the future. A major limitation of PEMS refers to its relatively high weight (PEMS unit, EFM, mounting devices, power supply), which may reach 80 kg

VW FOIA, EPA 06/20/2017 2017-FFP_027360

(i.e., equal to 1 person). As technological improvements of the test equipment are very likely (in terms modularity and size) the weight of the equipment could be reduced substantially in the future. In conclusion, the present test campaign has resulted in the successful application of PEMS for light-duty vehicles. The results of this test campaign indicate that on-road emissions might exceed substantially emission levels as identified during type approval in the laboratory.

The applied averaging window method, which has been implemented to check emissions of heavy-duty engines (EC, 2010), offers a simple and straightforward way to average and analyze emissions data of light-duty vehicles. Based on this method, appropriate indicators could be developed to evaluate whether an averaging window (or any other data sub-set) can be classified as extreme (as opposed to normal) driving conditions. Such analysis could address specific driving situations, for instance cold start, steep road grades, or aggressive high-speed driving.

Future research should address not-to-exceed regulatory concepts and alternative metrics for defining emission limits: the current approach that expresses emission limits as distance-specific quantities is problematic because it lacks a reference to actual engine parameters and only insufficiently accounts for the large variability of on-road driving conditions that may include long idling periods in congested traffic.

THE INTERNATIONAL COUNCIL ON CLEAN TRANSPORTATION

BRIEFING

MARCH 2015

Accelerating progress from Euro 4/IV to Euro 6/VI vehicle emissions standards

This brief presents the technical details and benefits of leapfrogging to Euro VI heavy-duty emission standards and Euro 6 light-duty emission standards rather than progressing through Euro 5/V.

INTRODUCTION

As many countries model their vehicle emission standards after those developed for the EU, the lessons learned in the European market should inform policymakers and manufacturers in other markets. This means acknowledging both the successes of these policies in leading to highly efficient control technology, and some of the failings in intermediate policy stages. Since the adoption of Euro 5/V standards across the EU, several shortcomings of the regulation have been revealed. For heavy-duty vehicles, Euro V standards have not achieved hoped-for reductions for NO_x emissions.[1] While Euro 5 standards have resulted in dramatic reductions in PM emissions from light-duty diesels, real-world diesel NO_x emissions have continued to far exceed certification limits.[2] Regulators should weigh these regulatory weaknesses when considering whether to move directly to Euro 6 and VI or to include the intermediate stages.

The type-approval process is critical in ensuring that reductions in limit values translate into reductions in real-world emissions from light- and heavy-duty vehicles. The type-approval

Prepared by Sarah Chambliss and Anup Bandivadekar

VW FOIA, EPA 06/20/2017 2017-FFP_027368

process specified for both Euro IV and V standards does not ensure that NO_x controls operate effectively in urban driving conditions. The issue has been addressed through the move to World Harmonized Test Cycles and efforts to improve real-world conformity to NO_x limits in Euro VI.[3] For light-duty vehicles, the current type-approval procedure (New European Driving Cycle or NEDC) allows certification of vehicles with real-world NO_x emissions far above regulatory limits,[4],[5] a problem that will be partly addressed in the Real-World Driving Emissions (RDE) provision of Euro 6c and the transition from the NEDC to the World-Harmonized Light-Duty Test Procedure (WLTP).[6] While Euro 5 standards have forced use of diesel particulate filters (DPFs) for light-duty diesels, only the Euro VI standard introduces a particle number (PN) limit for heavy-duty vehicles, leading to the use of diesel particulate filters (DPFs) for all diesel vehicles. Given the regulatory improvements that Euro 6/VI standards provide, countries following emission standards modeled after European regulations should move directly from Euro 4/IV to Euro 6/VI standards.

EURO VI HEAVY-DUTY VEHICLE STANDARDS

Euro VI is a critical step in heavy-duty emission standards, resulting in significant real-world reductions for both NO_x and PM emissions. Euro VI lowers both NO_x and PM limits and introduces a limit on particle number which leads to the use of a DPF for heavy-duty diesel vehicles. The standard also overhauls the testing procedures to better represent real-world driving conditions, broadens the set of pollutants considered, and strengthens durability and OBD requirements.

In the EU, Euro VI standards were implemented for all new vehicle registrations in January 2014,[7] with some provisions to be phased in by 2017.[8] To allow early introduction of lower-emitting vehicles, Euro VI type approvals were granted starting in August 2009. EU member states used tax incentives to encourage the sale of Euro VI certified vehicles before full implementation of the standards.[9] The same technology packages being used to comply with Euro VI standards have been necessary to comply with US standards since 2010.

FILTER-BASED PM CONTROLS FOR DIESELS

Euro VI standards lower the limit on PM emissions by 67% relative to Euro IV and V,[10] and introduce a particle number limit making a diesel particulate filter (DPF) the most cost-effective solution to meet emission requirements. Due to the high efficiency of DPFs at capturing PM, this results in a 90% drop in PM emissions[11] and >99% reduction in the number of ultrafine particles.[12] DPFs have been used to meet PM standards for heavy-

duty vehicles sold in the US since 2007, and have proven highly effective at reducing PM mass, ultrafine particles, and air toxics, as well as black carbon, a potent short-lived climate pollutant.[13],[14] Experiments investigating the health impacts of diesel exhaust that has passed through a DPF have found no evidence of cancer-causing effects, in contrast to unfiltered diesel exhaust.[15] By ensuring the use of DPFs, Euro VI provides much stronger air quality and health benefits than Euro V.

LIMITS ON PARTICLE NUMBER IN ADDITION TO MASS LIMITS

In addition to the more stringent limit on PM mass, Euro VI includes a limit on particle number, the measure of the number of individual particles emitted, and defines a new measurement procedure based on the work of the Particulate Measurement Programme (PMP) of the United Nations Economic Commission for Europe (UNECE).[16] The addition of the PN metric draws attention to emissions of ultrafine particles (less than 100 nanometers in diameter). Although ultrafine particles contribute little to the total PM mass, they are the dominant contributor to particle number. Because ultrafines can be inhaled more deeply into the lung, they are suspected of having greater toxicity than larger particles.[17] Wall-flow DPFs used on Euro VI engines reduce particle number emissions by >99%.[18]

REDUCED NO_X EMISSIONS

While Euro VI standards reduce the limit on NO_X emissions by 77% relative to Euro V, and by 89% relative to Euro IV, advanced test protocols that improve real-world conformity to NO_X limits result in real reductions that are closer to 95% relative to Euro V.[19] NO_X reductions are achieved with combustion improvements (high-pressure fuel injection and advanced air/fuel management), exhaust gas recirculation, and a closed-loop selective catalytic reduction (SCR) system. Euro VI vehicles are required to be certified under lower loads, lower speeds, and cold start conditions, ensuring that emission control systems are calibrated to function during the full range of driving conditions.

Real-world emissions data has shown that NO_X emissions from Euro V trucks and buses greatly exceed their certified limit values.[20],[21] Low speed driving forms a major component of vehicle use in countries such as India. Euro VI addresses the Euro V problem of under-emphasizing high NO_X emissions at the low-speed, low-load driving conditions typical of urban areas with test cycles that better represent real-world driving conditions. Euro VI standards replace the European Transient Cycle (ETC) and Stationary Cycle (ESC) with the World Harmonized Transient Cycle (WHTC) and Steady-State Cycle (WHSC). The WHTC requires both cold and hot start conditions and includes more

than twice the idling time as the ETC. Similarly, the WHSC includes an average engine load about half that of the ESC. Euro VI also introduced off-cycle emissions testing requirements that follow the not-to-exceed (NTE) limit approach used in the US. Testing of Euro IV, V, and VI certified engines on six non-regulatory, real-world duty cycles found that Euro VI certified vehicles consistently conformed to regulatory limits, unlike Euro IV and V certified vehicles which have average emissions approximately two and five times higher than their respective certification levels.[22]

The benefits of NO_X reduction for air quality include reduced formation of secondary $PM_{2.5}$ and ground-level ozone, as well as lower direct NO_2 emissions. Possible complementary provisions to Euro VI may include in the future a maximum limit for the NO_2 component of NO_X.

IN-SERVICE CONFORMITY TESTING FOR TYPE APPROVAL AND IN-SERVICE VEHICLES

In addition to the changes in laboratory testing, Euro VI importantly introduces in-service conformity (ISC) testing requirements using a Portable Emission Measurement System (PEMS).[23] Although this complements the test-cycle changes in ensuring conformity to NO_X emissions limits, it has emerged as one of the most important new aspects of the Euro VI regulation. The first ISC test must occur within 18 months of type approval, and the vehicle model must be tested at least once every two years.[24] Testing includes a mix of urban, rural, and highway driving, and tracks emissions of carbon monoxide, total hydrocarbons, CO_2, NO_X for diesel engines and methane for gas engines. In-service conformity has been enforced by previous standards, but this provision marks the first time that in-use testing is included in European vehicle emission standards, and ensures conformity to the Euro VI regulations.

NEW AMMONIA LIMIT

Euro VI introduces a new limit on ammonia (NH_3) emissions.[25] The selective catalytic reduction (SCR) systems used to control NO_X emissions in Euro IV-VI may produce excess ammonia as a byproduct (ammonia slip). The limit requires precise control of urea injection and tuning of the SCR system to prevent excess NH_3 and may also require the use of a guard catalyst installed downstream of the SCR (ammonia slip catalyst). Because ammonia emissions lead to the formation of secondary PM, controlling ammonia can improve air quality[26] as well as preventing the harmful environmental effects of ammonia deposition in water.[27] Ammonia is also harmful if inhaled directly.[28]

TIGHTER, WIDER-REACHING CONTROL ON METHANE

Euro VI tightens methane limits for CNG vehicles by 50% and imposes the same limit on LPG vehicles. Methane is a potent greenhouse gas[29] and can contribute to ground-

level ozone formation. Controlling emissions from alternative-fuel vehicles is increasingly important in regions where their market share is expected to grow.

EXTENDED DURABILITY REQUIREMENTS

Euro VI increases the durability distance requirement for all vehicle categories, but allows the same year period requirement as Euro IV and V. It requires durability of 160,000 km or 5 years (whichever occurs sooner) for small buses and pick-up trucks[30] compared to 100,000 km under Euro V; durability of 300,000 km or 6 years for mid-size trucks and buses[31] compared to 200,000 km under Euro V; and 700,000 km and 7 years for heavy trucks and buses[32] compared to 500,000 km under Euro V. Higher durability requirements in Euro VI ensure that emissions stay low throughout the useful life of the vehicle. Ensuring that the emissions control equipment is functioning through the most productive lifetime is especially critical for long-lived and intensively-used diesel vehicles.

IMPROVEMENTS IN OBD SYSTEMS

On-Board Diagnostic (OBD) systems for heavy-duty vehicles are increasingly important as more sophisticated in-cylinder controls and aftertreatment systems are added to vehicles. In addition to inducements to ensure proper operation, including torque limits when NO_x emissions exceed a threshold of 7.0 g/km or the system detects insufficient urea levels or quality, Euro IV standard introduced the first requirements for OBD monitoring of NO_x control systems. With Euro VI standards, OBD systems are also required to monitor the performance of the fuel injection system, exhaust gas recirculation (EGR) system, DPF, and any other emission related component.[33] They are also required to issue warnings for unexpected levels of urea consumption, and impose more severe inducements when urea level or quality is not sufficient for proper SCR performance. OBD threshold limits (OTLs), which if exceeded will signal a fault, are 82% lower for NO_x and 75% lower for PM with respect to Euro IV and Euro V OTLs. Finally, Euro VI requires improved communication procedures for OBD systems and requires improved access to OBD data for vehicle repair and maintenance.

EURO 6 LIGHT DUTY VEHICLE STANDARDS

Euro 6 standards narrow the gap between diesel and gasoline light-duty vehicle standards and strengthen OBD requirements. Some of the biggest changes to come with Euro 6, real-word driving testing and the introduction of new test cycle procedures, are almost finalized and are expected to be fully implemented within the 2017-2020 timeframe.

In the EU, Euro 6 is being introduced in three stages. Vehicles that were certified to meet Euro 6 limits ahead of the September 2015 regulatory deadline were allowed relaxed OBD requirements and no particle number limit for gasoline vehicles (the 6a stage). After September 2015,[34] all new-vehicle registrations must meet Euro 6 standards, including full Euro 6 OBD requirements but with preliminary OBD threshold limits and a relaxed PN limit for DI gasoline vehicles (the 6b stage). After three years of Euro 6 implementation,

30 N1 and M2 vehicle categories
31 N2; N3 ≤ 16 ton; and M3 Class I, Class II, Class A, and Class B ≤ 7.5 ton
32 N3 > 16 ton; M3 Class III, and Class B > 7.5 ton
33 Posada, F., and Bandivadekar, A. (2015). Global overview of on-board diagnostic (OBD) systems for heavy-duty vehicles. The International Council on Clean Transportation. Retrieved from http://www.theicct.org/global-overview-board-diagnostic-obd-systems-heavy-duty-vehicles
34 September 2015 is the implementation date for all new registrations of passenger cars (category M1) and light commercial vehicles (category N1, class I). The implementation for new type approvals occurs a year earlier, in September 2014. For heavier commercial vehicles (category N1 class II and III, category N2), Euro 6 will come into effect for new type approvals in September 2015, and apply to all new registrations in September 2016.

VW FOIA, EPA 06/20/2017 2017-FFP_027372

or after September 2018[35] for all new registrations, the stricter PN emission limit (equal to the diesel limit introduced with Euro 5b) becomes mandatory for all gasoline vehicles, final OBD threshold limits will be enforced, and real world driving emissions (RDE) requirements will be introduced (stage Euro 6c). As a final component of Euro 6c, the Worldwide harmonized Light vehicles Test Cycles (WLTC) will be adopted in place of the current New European Driving Cycle (NEDC). The timing of the WLTC adoption is not yet determined, but it is likely to happen in 2017–2020. No change in the Euro 6c regulated pollutants limits is expected with the introduction of WLTP, only the CO_2 targets.

LIMITS ON PARTICLE NUMBER FOR ALL FUEL TYPES

Limits on particle number (PN), important for controlling ultrafine particle emissions, were introduced in Euro 5b for compression-ignition vehicles.[36] While these PN limits applied to all light-duty diesel vehicles, they did not apply to the increasingly popular gasoline direct-injection (GDI) technology, which generates more particles than traditional port-fuel gasoline engines.[37] Euro 6c requires all vehicles to meet uniform PN standards, including those with spark-ignition GDI engines.[38] It is expected that GDI vehicles will meet PN standards with relatively low-cost gasoline particulate filters, estimated to cost less than USD$100.[39]

TIGHTER LIMITS FOR DIESELS NARROWS THE GAP BETWEEN FUEL TYPES

Euro 6 tightens the diesel NO_x standard by 55% with respect to Euro 5, and tightens the HC+NO_x standard by 26%–39% depending on vehicle type.[40] This partially addresses the long-standing issue that European emission standards are not fuel-neutral. Even under the Euro 4 standards, NO_x limit values for diesel vehicles were three times the limit values for gasoline vehicles. With Euro 6, NO_x emission limits for diesel vehicles are only 25% higher than for gasoline vehicles, a smaller margin than in any previous standard. With the use of DPFs to meet Euro 5 PM and PN limits, particulate emissions from diesel cars also approach those of gasoline cars. Euro 6 limits bring overall emissions of diesel and gasoline vehicles close to parity, provided that vehicles of both fuel types conform to standards in real-world driving conditions.

REAL-WORLD DRIVING TESTING

As with the Euro VI in-service conformity standards for heavy-duty vehicles, real driving emissions (RDE) testing will be included as an additional requirement for type approval in the final stage of Euro 6. Portable Emission Measurement System (PEMS) testing of early Euro 6-certified diesel vehicles has revealed that NO_x emission control systems that are sufficient to pass laboratory-based emissions tests may not operate at certified levels in real world driving conditions, with real-driving NO_x emissions three to six times those indicated by certification testing.[41] With RDE provisions, vehicle emissions of CO, NOx, and PN will be measured on the road using PEMS testing to ensure that emissions during real-world driving stay within reasonable limits. RDE testing will begin with a pilot

phase from 2015 through 2017. No limits will be enforced during this monitoring phase. An initial conformity factor will be set in 2015; the Euro 6 limit values will be multiplied by this conformity factor to determine the limits for RDE testing. In 2017, RDE testing against this conformity factor will begin. Conformity factors will be defined for NO_x and PN; they may be tightened in the future.

LOWER OBD THRESHOLDS

The On-Board Diagnostic (OBD) thresholds (OTLs) for Euro 6 are 70-75% lower than Euro 5 OTLs for NO_x and PM, depending on vehicle type, and about 10% lower for carbon monoxide (CO) and non-methane hydrocarbons (NMHC).[42] This means the OBD system is sensitive to more minor malfunctions in the emission control system, leading to earlier detection and corrections of such problems.

PLANNED MOVE TO A HARMONIZED TEST CYCLE

With full implementation of Euro 6, the World Harmonized Light Vehicles Test Procedure (WLTP) will replace the current test procedure. Under the new protocol, the World Harmonized Light-duty Vehicle Test Cycle (WLTC) will replace the New European Drive Cycle (NEDC), and a variety of test parameters will be adjusted to close loopholes and address shortcomings of the NEDC procedure.[43] The WLTC is more representative of real-world driving conditions than the NEDC[44], and will be complemented by the RDE testing efforts to ensure better conformity to standards in real driving conditions. The WLTP has other benefits for vehicle efficiency testing, and the use of a harmonized test will save auto manufacturers in development and certification costs.

CONCLUSION

Given the availability of ultra-low sulfur fuel (sulfur content less than 10 ppm), greater air-quality benefits can be gained from a leap from Euro 4/IV to Euro 6/VI than a path that includes the intermediate Euro5/V stage. For countries that are at prior standards for heavy-duty vehicles, skipping Euro IV and V altogether may also be an attractive option. Accelerating the adoption of heavy-duty vehicle Euro VI standards has two-fold benefits for air quality: the use of DPFs to comply with new PM and PN leads to a 90% or greater reduction of $PM_{2.5}$ emissions, and the new test cycle and in-service conformity requirements provide real-world reductions in NO_x emissions of 95% or greater, providing emission control even in urban driving conditions that remained a problem in Euro V. Light-duty Euro 6 standards promise a similar reduction in real-world NO_x emissions from diesel cars, through tighter emissions limits, a future move to the WLTP, and the inclusion of PEMS testing in the type approval process to ensure conformity to standards in actual driving conditions. Countries like India are poised to take full advantage of the mature, effective control technologies now available by skipping Euro 5/V and moving directly to Euro 6/VI.

VW: 1.8M COMMERCIAL VEHICLES, 700,000 SEAT CARS AFFECTED

BERLIN (AP) -- Volkswagen said Tuesday that 1.8 million commercial vehicles are among those affected by the emissions-rigging scandal, while Spanish unit SEAT said 700,000 of its cars were fitted with the diesel engine in question.

Volkswagen AG has admitted using a piece of engine software to cheat on diesel car emissions tests in the U.S. It said last week the engines concerned are in some 11 million vehicles worldwide, far more than the 482,000 originally identified by U.S. authorities.

Details have emerged gradually of how many were made by which VW division. Guenther Scherelis, a spokesman for the commercial vehicles unit - which makes vans and pickups - on Tuesday confirmed a report in the daily Hannoversche Allgemeine Zeitung that 1.8 million of its vehicles were affected. He didn't give further details.

Spanish subsidiary SEAT said it fitted 700,000 vehicles with the EA 189 diesel engines in which Volkswagen has said there are "discrepancies."
SEAT said the cars were sold worldwide and it was seeking to determine how many were sold in each market.

Also fitted with the suspect software were 5 million VW brand cars, 2.1 million Audis and 1.2 million Skodas.

SEAT and Volkswagen-Audi Spain on Tuesday ordered a suspension of sales of all SEAT, Volkswagen, Audi, Skoda and Volkswagen commercial vehicles with the EA 189 diesel engine. It said this decision would affect 3,320 vehicles currently in stock.

In Brussels, European Union Industry Commissioner Elzbieta Bienkowska was scheduled to meet Tuesday with Volkswagen brand chief Herbert Diess.
"We expect Volkswagen to explain the situation," said EU spokesman Ricardo Cardoso. "The Commission wants facts and wants to get to the bottom of this."

The German government last week set up a commission of inquiry on the scandal. Transport Ministry spokesman Martin Susteck said that the panel is in contact with the U.S. Environmental Protection Agency.

UPDATE 1-Volkswagen to refit cars affected by emissions scandal

BERLIN, Sept 29 (Reuters) - Volkswagen signaled on Tuesday it would recall up to 11 million vehicles as it tries to address the scandal over its admission that it cheated U.S. diesel emissions tests.

New Chief Executive Matthias Mueller said the German carmaker had drawn up a "comprehensive" refit plan to be submitted to regulators aimed at ensuring its diesel models complied with emissions standards.

It will ask customers "in the next few days" to have diesel models equipped with manipulated software refitted and brief authorities on technical fixes in October, Matthias Mueller told a closed-door gathering of about 1,000 top managers at Volkswagen's Wolfsburg headquarters late on Monday.

The company is under huge pressure to tackle the biggest business-related crisis in its 78-year history. Germany's KBA regulator had set an Oct. 7 deadline for it to present a plan to bring diesel emissions into line with the law.

Volkswagen has said previously about 11 million vehicles were fitted with software capable of cheating emissions tests, including 5 million at its namesake brand, 2.1 million at luxury brand Audi, 1.2 million at Czech division Skoda and 1.8 million light commercial vehicles.

"We are facing a long trudge and a lot of hard work," Mueller, appointed CEO of Europe's

biggest automaker last Friday, said in the speech text seen by Reuters. "We will only be able to make progress in steps and there will be setbacks."

Separately, Mueller said Volkswagen's troubled core VW division, struggling with high fixed costs and low profit margins, would in future be able to act as independently as premium flagship brands Audi and Porsche.

"The new company structure is a first step and the basis for a modernization of VW, for a new and better company," he said. (Reporting by Andreas Cremer; Editing by Ludwig Burger<http://blogs.reuters.com/search/journalist.php?edition=us&n=ludwig.burger&> and Mark Potter)

BBC News:
http://www.bbc.com/news/business-34390369

Seat says 700,000 cars have 'cheat' emissions software VW crisis
Seat has said about 700,000 of its cars are fitted with the software that allowed parent company Volkswagen to cheat US emissions tests.

A spokesman said they are currently trying to work out how many were sold in each national market.
In Spain slightly over 3,000 new cars are affected but showrooms have been told to put them aside.
VW has said a total of 11m diesel engines are involved in the emission's scandal.
Broken down brand-by-brand they are:

* VW - 5m
* Audi - 2.1m
* Skoda - 1.2m
* Seat - 700,000
* Vans - 1.8m

Seat said it planned to contact owners so their cars can undergo tests.
It will also set up a search engine on its website to allow customers to find out if their vehicles are affected.
The Spanish carmaker said it had temporarily suspended the sale and delivery of all new vehicles with the EA 189 engines which contain the software.

Volkswagen scandal
11 million
Vehicles affected worldwide

* €6.5bn Set aside by VW
* $18bn Potential fines
* No. 1 Global carmaker in sales

Scandal spilling over
The scandal is continuing to hit VW's share price. On Tuesday it fell another 1.5%<http://www.bbc.co.uk/news/business/market_data/shares/5/113230/one_month.stm> during morning trade in Frankfurt. The company has lost 35% of its market value since last Monday.

A survey of 62 institutional investors by the investment banking advisory firm Evercore, showed 66% of them would not invest in VW for 6 months or until it clarified what costs, fines, and legal proceedings it faced.

The effects are also spilling over into the local economy around VW's headquarters in Wolfsburg. The city is expecting a fall in business tax revenue from VW and the mayor has announced a budget freeze and hiring ban on public sector workers.

The scandal was revealed after the US Environmental Protection Agency found that some VW diesel cars were fitted with devices that could detect when the engine was being tested, and could change the car's performance to improve results.

The German company has apologised for breaching consumers' trust, and on Friday announced that Matthias Mueller was replacing Martin Winterkorn as chief executive. Mr Mueller promised a "relentless" investigation to uncover what went wrong.

He said the group was "facing the severest test in its history."

German prosecutors announced on Monday that it was conducting a criminal investigation of Volkswagen's former chief executive.

Volkswagen Close to Diesel Fix as Sales of Rigged Cars Halted
Elisabeth Behrmann<http://www.bloomberg.com/authors/AP6ltgka_yg/elisabeth-behrmann>
September 29, 2015 — 8:06 AM EDT

A brand new Volkswagen Passat and a Golf 7 car are stored in a tower at the Volkswagen Autostadt complex near the Volkswagen factory in Wolfsburg, Germany.
Sales halted in Spain, Switzerland, Italy and the Netherlands

* Volkswagen to inform customers soon of plans for repairs

Volkswagen AG is close to announcing a fix to emissions systems that cheated on pollution tests, as sales of vehicles with the rigged diesel engines get halted in a growing number of European countries.

Cars with the affected diesel engines are being pulled from markets including Spain, Switzerland, Italy, the Netherlands and Belgium, while prosecutors in Sweden consider opening an investigation on potential corruption. For vehicles already sold, Volkswagen is looking to inform customers soon about the steps it will take to repair the vehicles.
"It's going to depress their market share for a while, maybe even up to one to two years," said Richard Gane, an automotive specialist at supply-chain consultancy Vendigital Ltd. "This is going to run and run."

Almost two weeks after it publicly admitted to cheating on diesel emissions tests in the U.S., Volkswagen has yet to provide a comprehensive breakdown of the car models and markets affected. Information has emerged piecemeal in the scandal over a type of diesel engine installed in as many as 11 million vehicles worldwide. The number includes about 5 million VW brand cars, 2.1 million Audi models, 1.2 million from the Skoda unit and 700,000 from the Spanish Seat nameplate.

German Deadline
To reach out to customers, Volkswagen is looking into setting up websites in various countries so drivers can check on actions locally. The company has already set up a site<http://www.vwdieselinfo.com/> in the U.S., where the scandal started.
The German government has set an Oct. 7 deadline for Volkswagen to say how it'll bring some 2.8 million diesels in its home market up to standard, threatening to pull the cars off the road if the carmaker fails to do so.

As Volkswagen seeks to recover, the executive committee of its supervisory board, made up of union officials as well as shareholder representatives from the Porsche family and Lower Saxony, is meeting Wednesday to discuss the latest results from the investigation, a person familiar with the situation said.

Volkswagen Chief Executive Officer Matthias Mueller, who was appointed on Friday, said a project team devised a plan over the weekend and the company will start informing customers in the coming days that the emissions of their vehicles will need to be improved. The fix will be presented to regulators for approval in October.

'Long Road'
"We have a long road and a lot of work ahead of us," Mueller said in a speech to Volkswagen's management late Monday, confirming that the company hired law firmJones Day to assist with its internal investigation. "To this end, thoroughness is more important than speed."
Still, pressure is building on the company to come up with a solution. Swedish prosecutors at the National Anti-Corruption Unit are evaluating whether they have jurisdiction to start their own probe, said Alf Johansson, a chief prosecutor at the unit. In the Netherlands, the government is exploring regionwide recall of the vehicles.

"We would like you to consider the possibilities of a European recall," Dutch State Secretary Wilma Mansveld said in a Sept. 25 letter to the European Commission. "This has

to ensure that all faulty software is removed from the market and replaced by proper software that allows proper emission reduction."

Bloomberg:
http://www.bloomberg.com/politics/articles/2015-09-29/california-teachers-pension-scolds-volkswagen-on-emissions-dupe

California Teachers' Pension Scolds Volkswagen on Emissions Dupe
Alison Vekshin<http://www.bloomberg.com/politics/authors/AOWq1oX1-C4/alison-vekshin> <http://twitter.com/alisonvekshin> Margaret Collins<http://www.bloomberg.com/politics/authors/APs6rgY-8H4/margaret-collins>Tim Jones<http://www.bloomberg.com/politics/authors/AQIjj4Bpzcg/tim-jones>
September 29, 2015 — 5:00 AM EDT

California's $184 billion pension fund for school teachers chided Volkswagen AG for rigging some diesel engines to cheat on U.S. emission tests and said it is evaluating its exposure to losses from the scandal.

The California State Teachers' Retirement System, the second biggest U.S public pension, held 37,580 Volkswagen shares valued at $4.85 million as of Sept. 25 and 284,856 of the company's preferred shares worth $34.2 million.

The Wolfsburg, Germany-based company admitted Sept. 18 that it programmed some of its cars' diesel engines to meet emissions standards only when undergoing official tests while letting them exceed legal pollutant limits on the road. Volkswagen's market value has plunged 27 billion euros ($30.3 billion) since the announcement.

"As owners we actively monitor our holdings and expect our portfolio companies to govern themselves responsibly."

- Michael Sicilia, Calstrs spokesman

"Calstrs is clearly disappointed that a company in our portfolio has managed to simultaneously damage both its shareholder value and the environment that we're pledging to protect," said Michael Sicilia, a Calstrs spokesman. "As owners we actively monitor our holdings and expect our portfolio companies to govern themselves responsibly."

About 11 million vehicles around the world were fitted with the defeat devices. The company has set aside 6.5 billion euros to cover damages including fixes, potential regulatory fines and lawsuits.

Not only is California home to the two biggest public pension funds, it has more of the cars on its roads than any other state and has the toughest carbon emission standards in the U.S.

Following the admission that the company cheated in order to try and gain U.S. market

share, Chief Executive Officer Martin Winterkorn stepped down and the U.S. Federal Bureau of Investigation has opened a criminal probe. U.S. states also are looking into the company's actions.

Volkswagen is facing more than 80 federal court lawsuits by consumers alleging the company committed fraud by cheating on emissions tests, inducing them to pay more for their vehicles. Those lawsuits were filed as class actions representing all consumers in the U.S. or in individual states who leased or bought the vehicles.

A Michigan pension fund for police and firefighters alleges in a lawsuit that holders of VW's American depositary receipts lost hundreds of millions of dollars.

The $286 billion California Public Employees' Retirement System said it has about $165 million invested in Volkswagen. The fund, the biggest in the U.S., is "examining the situation and continue to monitor," said spokesman Joe DeAnda.

New York state's pension fund -- which was worth $184.5 billion as of March 31 -- has 22,927 ordinary shares of Volkswagen valued at about $5 million, according to Matt Sweeney, a spokesman for state Comptroller Thomas DiNapoli, the fund's sole trustee. It has another 159,979 shares of Volkswagen's non-voting preferred shares worth $33.3 million, Sweeney said by e-mail.

The $50 billion Alaska Permanent Fund Corporation held 15,009 shares of Volkswagen stock as of June 30, valued at $3.47 million. "It doesn't exactly move the needle, does it?" said Laura Achee, the fund's director of communications.

The Teacher Retirement System of Texas declined to comment on its holdings but said that any investment in Volkswagen would be a drop in the bucket of its $132 billion assets, according to communications director Howard Goldman. At the $26 billion Employees Retirement System of Texas, which provides retirement benefits for state employees, retirees and their dependents, VW holdings are similarly negligible.

"We have some in equities and in fixed income, but very small," said spokeswoman Mary Jane Wardlow in an e-mail.

Volkswagen shares are also held in the pension plans of private companies including General Motors Co. and International Business Machines Corp., according to their latest filings with the Labor Department.

GM doesn't comment on individual holdings in its pension plans, spokesman Pat Morrissey said in an e-mail. The company reported shares in Volkswagen valued at about $1 million in its latest filing with the Labor Department as of Sept. 30, 2014. That's a small portion of the plan's about $80 billion.

CBS News:
http://www.cbsnews.com/news/volkswagen-faces-daunting-challenges-in-fixing-emissions-cheating/

VW faces daunting challenges in fixing emissions cheating

DETROIT - Volkswagen faces daunting challenges in fixing software that enables cheating on diesel engine emissions tests, a task that's becoming more urgent because of growing anger from customers.

The company has set aside $7.3 billion to pay for the scandal. But experts say it's likely to cost much more as VW tries to comply with U.S. clean air regulations while appeasing diesel owners who paid extra for the cars, thinking they could help the environment without sacrificing performance.

"We understand that owners of the cars affected by the emissions compliance issues are upset," VW said on a consumer website launched Sunday. The company asked for patience and said it would address the issue as fast as it can. A spokeswoman wouldn't comment further.

But experts said VW will have to strike a careful balance to appease government regulators, make customers happy and avoid emptying the company cash box. A cheap remedy of software fixes likely would hurt performance and gas mileage, further antagonizing customers. A more expensive fix that adds a treatment system wouldn't hurt performance, but it would cost thousands per car and by one analyst's estimate, could total more than $20 billion including vehicles in the U.S. and Europe.

That's in addition to a potential $18 billion fine in the U.S. and the cost of numerous class-action lawsuits alleging that VW's cheating reduced the value of its customers' cars.

The scandal broke on Sept. 18, when the U.S. Environmental Protection Agency and the California Air Resources Board accused VW of installing secret software on 2-liter four-cylinder diesel engines that turned on pollution controls for lab tests and shut them off during real-world driving. As a result, 482,000 Jettas, Beetles, Golfs and Passats from the 2009 to 2015 model years belched out 10 to 40 times as much ozone-causing nitrogen oxide as U.S. law allows.

A few days later, VW admitted the same "defeat device" that switched the pollution controls on and off was on 11 million cars worldwide. Germany says 2.8 million cars there are affected.

Software in the main engine control computer figured out when the cars were being tested on a treadmill-like device called a dynamometer that the EPA used for verification and turned the controls on.

With the pollution controls on, the cars are less efficient and won't accelerate as fast, the two main reasons why people bought the VW diesels, said Matt DeLorenzo, managing editor and a diesel expert for Kelley Blue Book. VW could change the software and leave the controls on to satisfy the EPA and California regulators. But that would anger customers and likely would force VW to compensate them for the reduced mileage, just as Hyundai did when it got caught with inflated fuel economy estimates, DeLorenzo said.

"If it's really sluggish and doesn't get out of its own way, that's a bigger issue (to customers) than fuel economy," DeLorenzo said. "People notice that big of a change in performance."

The other option is to add a diesel exhaust treatment system that's used by other manufacturers and even by VW on larger diesel engines. The treatment involves adding a tank of a chemical called urea, which enables the cars to separate nitrogen oxide into harmless nitrogen and oxygen. That would cost $2,000 or more per car, DeLorenzo said.

Engineers would have to find room for a tank to store the blue urea fluid, which has to be refilled about every 7,500 miles, DeLorenzo said. And VW probably would have to compensate customers for years of urea cost, which is about $13 for 2.5 gallons.

VW probably tried to avoid urea systems in the beginning because their cost would have driven Jetta and Golf prices above competitors, especially gas-electric hybrids, DeLorenzo said. Now, adding it after the fact will cost even more, he said.

The scandal has forced Volkswagen to tell U.S. dealers not to sell cars with the suspect diesel engines. VW said on Sunday that it's working to get government approval to sell 2016 models with updated engines "which we believe do not have any of the issues the government has identified in other vehicles."

The 2015 and 2016 models have a new version of the 2-liter diesel engine that probably runs cleaner and could need just a software change to comply, DeLorenzo said.

But on older models from 2009 to 2014, the fix may be more difficult. Mike Jackson, CEO of AutoNation, the largest dealership chain in the U.S., said he was told by VW that it will take hardware and software changes to fix the older models. The EPA says it may take VW a year to develop a fix.

Before the 2009 model year, U.S. diesel emissions standards weren't as strict, so those cars likely passed the tests without a defeat device, DeLorenzo said.

Whenever the fix comes, it's possible that owners might not get it done if it hurts their cars' mileage and performance, and the EPA can't force people to take their cars in for repairs.

The agency only has authority over automakers, not car owners.

The EPA says some states require proof that emissions recalls have been fixed before license plates are renewed. And the possibility of failing emissions inspections in states that require them apparently won't be an issue because of the cheating software. "The defeat device was specifically designed to ensure that vehicles would pass inspection," the agency says on its website.

In wake of the scandal, the automaker's stock dropped about 30 percent this past week alone, CBS News correspondent Kris Van Cleave reported.

Volkswagen introduced is new CEO on Friday. Matthias Mueller, the former head of Porsche, will try to restore VW's reputation.

The Guardian:
http://www.theguardian.com/business/2015/sep/26/volkswagen-scandal-emissions-tests-john-german-research

Meet John German: the man who helped expose Volkswagen's emissions scandal
Automative engineer's research connected the dots to how the automaker manipulated diesel emissions tests – but that was never the intention
Rupert Neate in New York

John German has barely had time to catch his breath all week between appearances on TV news channel and radio phone-in shows. He's an unlikely media star, not a pop singer or reality TV contestant, but a grey-haired automotive engineer thrust into the global spotlight after he and his colleagues were credited with helping uncover one of the biggest ever corporate scandals.

"We really didn't expect to find anything," German said of his research that found Volkswagen had installed sophisticated software designed to cheat strict emission tests across the world. His simple test – checking the car's emissions on real roads rather than in lab test conditions – led to the resignation of VW's chief executive after the German company was forced to admit it installed "defeat devices" in 11m cars. The scandal has wiped more than €24bn ($26.8bn) off VW's market value.

Many questions remain but one thing is clear to German: "It was not an accident," he said. "A lot of work has gone into this."

When German finally found a moment of peace this week he called his wife in Ann Arbor, Michigan. "She said: 'You know you've made it now, you can retire and be very happy'," German told the Guardian as he prepared to board a plane back to Michigan after a week in the spotlight in Washington DC. "No, no, no, I can't afford to yet," German told his disappointed wife.

He may have helped uncover one of the world's biggest corporate scandals, but German earns a modest salary as US co-lead of the International Council on Clean Transportation (ICCT) a small nonprofit organisation dedicated to helping to reduce vehicle emissions and has an annual budget of just $12m.

"It has been totally overwhelming," German said of the global interest in his research this week. "I've been doing nothing else [but responding to the media and politicians] for 12 hours a day since Friday," when US regulators announced their findings against VW based on German's research] "We're a small organisation that primarily deals with information on diesel filters, so this is unprecedented and overwhelming.

"As an organisation that is trying to reduce emissions and improve efficiency it is always gratifying to see results from our work, but we never dreamed we would have this kind of impact."

German explained that the idea to carry out the test, which he described as "very ordinary", came from Peter Mock, a colleague in Europe, who noticed discrepancies in the emissions of the diesel VW Passat and VW Jetta. He said they decided to carry out on-the-road tests in the US as the emissions regulations are much stricter than in the EU. They expected the cars to pass and they could use this as proof to show Europeans that it was possible to run diesels with cleaner emissions.

German, who has a degree in physics from the University of Michigan and said he "got over halfway through an MBA before he came to his senses", sought out the assistance of the West Virginia University's Center for Alternative Fuels, Engines and Emissions. The WVU provided a portable emission measurement system that could be put in the car's boot (trunk) with an attached probe placed in the exhaust pipe.

Then German sourced a Passat, Jetta and a BMW X5 (which also showed emissions discrepancies in Europe) and "had a drive around". "The VWs were massively exceeding their official emissions readings in normal driving conditions, which was completely inexplicable and totally surprised us," German said.

Thinking it must be a technical error, the tests were expanded and the cars were driven more than 1,200 miles from San Diego to Seattle – almost the entire length of the west coast of the US.

The VWs nitrogen oxide emissions – which creates smog and has been linked to increased asthma attacks and other respiratory illnesses – still exceeded the US standards by up to 35 times. The BMW X5 was within the regulated range.

Arvind Thiruvengadam, a research assistant professor at WVU, who conducted the tests said: "We were doubting ourselves and our procedures and making sure to double check that we were not doing anything wrong. We did so much testing we couldn't possibly doing the same mistake again and again.

"We were like 'OK, we're going to write a lot of journal papers, and we'll be happy if three people read these journal papers,'" he told National Public Radio last week. "That's our happiness at that point."

German published the research in May 2014 and handed it over to the Environment Protection Agency (EPA). "There was an expectation that they would find out what was causing the higher-than-expected emissions," he said. "We did send a courtesy copy to VW to say 'vehicles B and C are your vehicles and you might like to know', we had no response."

There was no response from the EPA either, but keen-eyed German noticed an EPA press release in which VW agreed to recall almost 500,000 vehicles in December 2014 to reinstall software, which it said would solve the higher-than-expected emissions.

However, a couple of months later the California Air Resources Board (Carb) carried out spot checks and discovered that the "defeat device" software – used to dramatically reduces nitrogen oxide (NOx) emissions only when the cars are undergoing strict emission tests – was still present.

"That is actually the single most inexplicable thing about this whole business," German said. "VW had a chance to fix the problem, and they continued to try and cheat and do what they had done. That's just amazing."

"Only then did VW admit it had designed and installed a defeat device in these vehicles in the form of a sophisticated software algorithm that detected when a vehicle was undergoing emissions testing," the EPA said in a statement last week.

German said it was unclear how the defeat device software worked, but the software could work by detecting periods when the steering column wasn't turning but the wheels were which would indicate the car was on dynamo-meters for testing, or could also test for the precise uniform temperature that the tests are carried out at.

"The kind of software it takes to first detect when you're driving on the official test would be very hard to develop. And then you would need duplicate software to tell the car to have two different emission controls."

UK, France and Germany lobbied for flawed car emissions tests, documents reveal
He said it was impossible to know how far up the food chain at VW the fraudulent activity went, but said: "It would have had to be quite a few people involved. It certainly won't have just been one individual."

German said VW could have continued in the deceit for the foreseeable future if no one had thought to test the cars emissions on real roads. He said there is no way to know if other car companies may also have been using similar methods to trick official emission tests, but welcomed UK, German and US regulators moves to retest cars emissions on real roads.

German, who drives a 1997 Honda Accord station wagon that he says has pretty good emissions for a manual transmission, said he hopes his work will act as a wake-up call and scare the whole industry into making certain that their vehicles comply with all emissions regulations. "Companies should realise they might get away with stuff for a little while, but it will catch up with them."

He refused to enter into discussion about what sort of action should be taken against VW, which is facing a fine of up to $16bn in the US alone and a possible criminal investigation. "That's really up to others, I'm just an engineer from Michigan it's really beyond my field of reach."

Consumerist:

Report: Volkswagen Knew Of "Defeat Devices" Eight Years Before EPA Action
By Ashlee Kieler September 28, 2015

An internal review spurred by the emissions scandal that has engulfed Volkswagen over the past week found that the carmaker knew that so-called "defeat devices," used to trick emissions tests, were used in more than 11 million VW and 2.1 million Audi diesel vehicles for several years before the Environmental Protection Agency issued a violation notice to the manufacturer ordering it to recall some 500,000 million sedans.

The Associated Press, citing two German publications, reported Monday that VW's internal investigation has so far found at least two incidents in which VW was made aware that the use of defeat devices were against the law.

The Frankfurter Allgemeine Sonntagszeitung, a German publication, reported on Sunday that VW's internal investigation shows one of the company's own technicians was aware of the software.

Back in 2011, an engineer reportedly expressed concern that using the device was illegal, but was ignored.

The same investigation turned up a letter, dated 2007, from parts supplier Bosch that warned the car company not to use the software during regular operations of vehicles.

According to Bild am Sonntag, sources uncovered the internal communications between Bosch and VW, with the parts supplier insisting that the software was for test purposes and that using it in regular operation would be against the law.

Bosch, one of the largest car parts suppliers in the world, admitted last week that it supplied many of the key components for the defeat devices as a way to evade emissions standards for certain pollutants with a range of serious health effects.

According to the EPA's order [PDF], the "sophisticated software algorithm" in the vehicles is programmed to detect when the car is undergoing official emissions testing, and to only turn on full emissions control systems during that testing.

However, the effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations.

Volkswagen declined to address the new reports, saying it doesn't comment on "rumors and speculation."

"Volkswagen is working with all its strength to conduct a thorough and merciless investigation of this matter," a spokesperson tells the AP.

In addition to new revelations that VW was aware that the defeat devices were illegal, CNBC reports that the company's now former CEO Martin Winterkorn is under criminal investigation by German prosecutors related to fraud.

Winterkorn stepped down last week, noting that he took full responsibility for irregularities in nearly 11 million diesel vehicles found to contain "defeat devices," the former CEO is at the center of the latest investigation into the manufacturer.

Mothers Jones:
http://www.motherjones.com/kevin-drum/2015/09/vw-tries-blame-engine-emissions-fraud-low-level-engineers-and-technicians

VW Tries to Blame Engine Emissions Fraud on Low-Level "Engineers and Technicians"
—By Kevin Drum

I guess it was just a few bad apples. That's a relief:

Volkswagen has blamed its emissions scandal on a "small group" of people and has suspended a number of staff as Matthias Müller was unveiled as its new chief executive.

....Berthold Huber, the acting head of VW's supervisory board, called the crisis a "moral and policy disaster"...."The test manipulations are a moral and political disaster for Volkswagen. The unlawful behaviour of engineers and technicians involved in engine development shocked Volkswagen just as much as it shocked the public."

This is ridiculous. What incentive do low-level engineers and technicians have to do this on their own? Hell, they couldn't even take on a project like this unless their managers OKed the time to do it, and their managers wouldn't do it unless they were being pressed by higher-ups. Anybody who's ever worked at a big corporation knows this perfectly well. And according to Bloomberg, that's exactly what happened:

Volkswagen AG executives in Germany controlled the key aspects of emissions tests whose results the carmaker now admits were faked, according to three people familiar with the company's U.S. operations.

....Their accounts show the chain of command and those involved in the deception stretched to Volkswagen headquarters.... Ulrich Hackenberg.... Wolfgang Hatz are among those who will leave the company in the wake of Winterkorn's resignation two days ago, two people familiar with the matter said. The two previously ran units at the heart of the affair — Hackenberg, a Winterkorn confidant, was responsible for VW brand development from 2007 to 2013, while Hatz ran the group's motor development from 2007 to 2011.

Will it go even higher? Stay tuned. However, I'll call BS on UBS, which apparently thinks this scandal "could signal the eventual end of the combustion engine." Please. There's no difficulty "amassing accurate data" on engine emissions, as one of their analysts suggests. VW amassed very precise data. They just chose to hide it by means of a calculated, premeditated, multi-year fraud. Anyone who hasn't done the same should be in fine shape.

Legal woes mounting for Volkswagen as criminal cases loom
Volkswagen admitted that 11 million of its diesel vehicles sold worldwide contained software specifically designed to help cheat emissions tests.
By Michael Biesecker and Eric Tucker ASSOCIATED PRESS SEPTEMBER 28, 2015

WASHINGTON — Who knew about the deception, when did they know it, and who directed it?

Those are among the questions that state and federal investigators want answered as they plunge into the emissions scandal at Volkswagen, which has cost the chief executive his job, caused stock prices to plummet, and could result in billions of dollars in fines.

Legal experts say the German automaker is likely to face significant legal problems, including potential criminal charges, arising from its admission that 11 million of its diesel vehicles sold worldwide contained software specifically designed to help cheat emissions tests.

The Environmental Protection Agency has accused VW of installing sophisticated stealth

software that enabled ''clean diesel'' versions of its Passat, Jetta, Golf, and Beetle models to detect when they were being tested and emit less-polluting exhaust than in real-world driving conditions. The agency says the ''defeat devices'' allowed those models to belch up to 40 times the allowed amounts of harmful fumes in order to improve driving performance.

The Justice Department says it's ''working closely'' with EPA investigators.

''If there is sufficient evidence to show that Volkswagen intentionally programmed its vehicles to override the emission control devices, the company and any individuals involved could face criminal charges under the Clean Air Act, and for conspiracy, fraud, and false statements,'' said David M. Uhlmann, a former chief of the Justice Department's Environmental Crimes Section who is now a law professor at the University of Michigan. He called criminal charges ''almost certain.''

But Uhlmann cautioned that hauling the executives involved into a US courtroom could be challenging, because much of the conduct at issue probably occurred overseas. While the United States has an extradition treaty with Germany, European regulators also are investigating and could claim first dibs on prosecuting company officials.

'[Volkswagen is] facing a tsunami of possible state and federal enforce-ment actions.' William Carter, former federal prosecutor who specialized in environmental crimes

It's not the first time that Volkswagen has been accused of cheating on emissions testing by the EPA. In July 1973, the agency found that VW had installed temperature-sensitive devices that turned off emissions controls on about 25,000 Fastback, Squareback, and bus models. The company agreed to remove the devices and eventually settled with the Justice Department, paying a $120,000 penalty.

Chief executive Martin Winterkorn resigned on Wednesday, and Volkswagen announced it would set aside $7.3 billion to cover the cost of the scandal, but even that may not be enough.

The company has apologized, but has not yet detailed who was responsible for the defeat devices.

German media reported Sunday that Volkswagen had received warnings years ago about the use of illegal tricks to defeat emissions tests. Bild am Sonntag said VW's internal investigation has found a 2007 letter from parts supplier Bosch warning Volkswagen not to use the software during regular operation. Frankfurter Allgemeine Sonntagszeitung said a Volkswagen technician raised concerns about illegal practices in connection with emissions levels in 2011.

A Volkswagen spokesman declined to comment on the reports.

The Clean Air Act allows for fines of up to $37,500 for each of the 482,000 suspect VWs sold in the United States, potentially totaling more than $18 billion. Attorneys general for

nearly 30 states and the District of Columbia have announced a coordinated investigation and said they are issuing subpoenas for company records.

There's also a high likelihood of class-action lawsuits by angry VW owners.

''They're facing a tsunami of possible state and federal enforcement actions, and a potential large number of violations — including administrative, civil, and criminal,'' said William Carter, a former federal prosecutor in Los Angeles who specialized in environmental crimes and served as general counsel of the California Environmental Protection Agency.

Investigators will almost certainly look for any false statements made to the EPA and for signs that VW has tried to conceal wrongdoing or obstruct regulators. Fraud charges could be considered if evidence emerges that company executives used the Internet or the mail system to carry out the deception. And money laundering allegations will be explored if investigators suspect that VW sent illicit proceeds overseas.

''If a software package such as this were intentionally designed to defeat the emissions testing, there may well be e-mail traffic, meetings, records that would establish that intent,'' said Gregory Linsin, a former environmental crimes prosecutor at the Justice Department.

But Linsin said he expected the Justice Department also to take into account the multiple investigations likely to take place worldwide, and to not punish the automaker in a way that jeopardizes its ability to stay in business.

The problems at VW come as the Justice Department faces growing pressure to prosecute individual executives and employees for corporate misdeeds. The last two major criminal investigations against auto companies — Toyota and General Motors — yielded massive fines over car safety problems but have resulted in no prosecutions of executives. Those outcomes dismayed consumer watchdog groups and grieving victims' relatives, who demanded better accountability for failure to disclose vehicle defects.

A memo this month by Deputy Attorney General Sally Yates sought to reaffirm the Justice Department's commitment to prosecuting employees and executives, directing among other policy mandates that corporations pushing for credit for cooperating with the government must first turn over evidence against individuals.

''Volkswagen has a fundamental choice to make,'' said Uhlmann, the former prosecutor. ''That is whether it intends to cooperate and seek leniency, or whether it wants to fight the charges. Every indication over the last several days from Volkswagen is that it intends to cooperate.''

Asked whether that meant he expected company executives to voluntarily come to the United States to stand trial, he laughed.

''Absolutely not,'' he said.

AP (via Dallas Morning News):
http://www.dallasnews.com/business/headlines/20150927-sell-sue-or-stay-put-considerations-for-volkswagen-owners.ece

Sell, sue or stay put: considerations for Volkswagen owners
Tom Krisher and Dee-Ann Durbin
Updated: 27 September 2015 11:10 PM

DETROIT — If you're driving a diesel-powered four-cylinder Volkswagen, you're stuck with a fun-to-drive machine that's belching unhealthy pollutants from its tailpipe.

Until the company figures out how to fix its bogus emissions controls, there isn't much you can do about your dirty diesel.

Following disclosures that Volkswagen developed software for its 2-liter diesel engine that could better control pollutants during testing than in real-world driving, there's a lot up in the air for owners of Jettas, Golfs, Passats and Beetles and Audi's A3.

Here are some things to consider if you're thinking of suing, selling or are unsure of what to do next.

The problem

VW's software turned on pollution controls for government tests, which are done on a treadmill device called a dynamometer. When the software deduced that the cars were back on the street, the controls went off and the cars polluted too much. About 500,000 of the cars were sold in the U.S.

VW hasn't said how it will fix the problem.

Owners worry the repairs will cut fuel economy and performance — the reasons they bought the "clean" diesels in the first place.

"I really hope they fix this thing," said Zandy Hartig, an actress in Los Angeles who owns a diesel 2013 Jetta SportWagen. "I assume since they did it on purpose they can undo it."

The EPA has told VW to fix the cars so they comply with pollution regulations, but there's no word from the company on how or when that will be done. The EPA said it could take a year.

"We understand that owners of the cars affected by the emissions compliance issues are upset," VW said on a consumer website launched Sunday. The company asked for patience and said it would address the issue as fast as it can. A spokeswoman wouldn't comment further.

A recall fix may be coming soon for 2015 and 2016 models, neither of which can be sold until repairs are made. Mike Jackson, CEO of AutoNation, the country's largest auto dealership chain, said that he was told by VW officials that a software change will bring the last two model years into compliance.

But it's a mystery how the company will fix models from 2009 through 2014, including whether software and equipment changes will be needed, he said.

Did my car lose value?

Worried about their cars losing value, some owners might rush to put the car up for sale.

Eric Ibara, senior analyst for Kelley Blue Book, is encouraging owners to hang on to their VWs, at least until the company comes up with a fix.

Ibara said the impact on VW's resale values may not be known for two or three weeks. The price that dealers agree to pay for vehicles being auctioned this week will be the first indication.

VW diesels traditionally have higher resale values than gasoline counterparts, but the scandal might erode that premium, Ibara said, especially if the fix cuts mileage or impacts their sporty performance.

If repairs are made, history shows there might not be a lasting impact. General Motors' residual values weren't affected by ignition switch recalls, and Toyota's car values returned to normal within a year of an unintended acceleration crisis.

Some owners are hoping for rebates, while a consumer group called on VW to buy back the diesels.

Legal action?

Joining a lawsuit against VW is one option for owners, although it is likely to take years to get any relief.

Several U.S. lawsuits have been filed, some alleging the cars' values will fall because of the scheme.

Consumers could have some success in the courtroom. In 2012, for example, Toyota agreed to pay more than $1 billion to resolve hundreds of lawsuits filed by owners who said their vehicles lost value after the company's unintended acceleration problems.

Also, politicians are calling on the Federal Trade Commission to investigate, because VW often advertised the cleanliness of the vehicles. The FTC, which monitors advertising claims, can seek remedies for all of the car owners.

Don Marron, 58, a banker from Allentown, Pa., wants Volkswagen to take back his 2012 SportWagen and apply the credit toward a new car. He'd also consider a repair that didn't compromise performance or fuel economy.

"I'm going to wait and see what they do, but I'm not going to do nothing," he said. "It's just dumb that they did this. How could they think that it wasn't going to be discovered? What arrogance, what bad judgment."

WSJ:
http://www.wsj.com/articles/auto-parts-makers-hit-by-vw-scandal-1443395198

Auto-Parts Makers Hit by VW Scandal
Suppliers move to defend diesel technology, fearing shift toward alternatives
By JEFF BENNETT
Updated Sept. 27, 2015 7:50 p.m. ET

Auto-parts makers with big exposure to the diesel-car market are racing to salvage the technology's reputation in the wake of the Volkswagen AG emissions-cheating scandal.

Shares of the parts makers, which include Tenneco Inc., BorgWarner Inc., Delphi Automotive PLC and Continental AG, were pummeled last week following the Environmental Protection Agency's disclosure that VW cheated for years on emissions tests of its diesel-powered cars.

The parts industry's focus has shifted to defending the viability of diesel technology amid concerns that betrayed consumers or auto makers, which face tighter government scrutiny of diesel, will turn their attention to hybrids and electric-powered vehicles.

"You can't have an event like this without questions being raised, but that doesn't mean the technology doesn't work," said Terrence Hahn, chief executive of Honeywell International Inc.'s $3.8 billion Transportation Systems unit.

"We have seen proven results around clean-diesel technology, and we don't want what one auto maker has done to tarnish the industry or the technology," Mr. Hahn said.

Wall Street wasn't convinced, however. Shares of Honeywell, a major supplier of the turbochargers often used to make diesel-powered cars peppier, fell 10 cents Friday to $93.52, down about 5% from their close on Sept. 18. That was the day the EPA accused VW of installing illegal software that sharply reduces nitrogen-oxide emissions, but only when the cars are undergoing strict emission tests.

VW later acknowledged its use of the software and issued an apology.

The company promised to find a remedy to repair the 482,000 VW diesel cars in the U.S. as soon as possible. On Sunday, it launched the website vwdieselinfo.com to tell VW diesel

owners about the company's plans to fix their vehicles.

Shares of Tenneco, which makes emissions systems and gets 8% of its revenue from VW, sank almost 8% last week, while those of BorgWarner, which generates 17% of its revenue from the auto maker, fell 6%, finishing the week at $40.

BorgWarner recently opened plants in Portugal and South Korea, partly to produce more components used in starting diesel engines.

Continental, a German supplier of engine components, also was under pressure. Its stock lost nearly 6% of its market value last week.

Closely held Robert Bosch GmbH, the German giant that supplied the components now at the center of the emissions probe, has said VW was responsible for how the parts were installed.

On Friday, the EPA indicated it would step up scrutiny of diesel vehicles by overhauling the way it oversees the industry's compliance with emissions standards.

The regulator sent a letter to auto makers saying that it will conduct tests of 2015 and 2016 vehicles under normal driving conditions, rather than accepting lab results, as it has done in the past.

In the U.S., diesel engines are largely confined to heavier trucks, with diesel-powered cars representing just a small part of the passenger-car market. But diesel is dominant in Europe, accounting for more than 50% of the passenger-car market in 2015, according to Barclays.

Before the scandal broke, J.D. Power & Associates expected diesel to expand to 7% of the U.S. light-vehicle market by 2017 from 3% this year.

Barclays analyst Brian Johnson suggests those growth expectations need to change, both in the U.S. and Europe. And that will squeeze some parts makers.

"Whatever the specifics that emerge from a VW investigation, we believe strongly that the VW scandal will heighten the pressure on diesel in Europe," he said in a research note last week.

"The end result of the VW issues will be to accelerate a move away from diesel in the European mass market, pressuring suppliers leveraged to diesel," Mr. Johnson said.

Mike Jackson, chief executive of AutoNation Inc., the largest U.S. auto retailer, said it would tough to rebuild trust with potential diesel buyers in the U.S. "It is another black eye for diesel engines overall," he said.

Mr. Johnson of Barclays added that auto makers might need to accelerate development efforts of electric vehicles, hybrid and more-efficient gasoline engines.

That could help parts makers, since many of the same companies will have to supply those component. But their investments in diesel-powered cars could be lost if the industry shifts to those alternatives.

VW scandal: German prosecutors probe Winterkorn as Volkswagen emissions-rigging crisis spreads to 2.1 million Audi cars and Skoda models
By Julia Bradshaw10:31AM BST 28 Sep 2015

Prosecutors in Germany have opened a criminal investigation into former Volkswagen chief executive Martin Winterkorn in the wake of the emissions-rigging scandal.

The probe is understood to concentrate on accusations of fraud after it was revealed that VW had fitted 'defeat' devices in millions of its diesel cars worldwide to cheat government emissions tests.

The investigation aims to establish who was responsible, according to the statement from prosecutors in Braunschweig, Germany, and will look at Mr Winterkorn's role in the worst crisis to hit VW in its 78-year history.

The prosecutors have also received a number of criminal complaints, including one from Volkswagen itself.

Winterkorn quit saying he was "not aware of any wrongdoing on my part"

Under the German system, anyone can file a criminal complaint with prosecutors, who then must examine the complaint and decide whether there is enough evidence to open a formal investigation and for charges to be brought.

It is essentially the equivalent of a police investigation in the UK.

Prosecutors say it is too early to determine if and when they may try and interview Mr Winterkorn himself.

"This is a very broad case and in other such investigations it has taken many months, sometimes years," a spokesman said.

Mr Winterkorn stepped down as CEO last week and was replaced by former Porsche boss Matthias Mueller after the emissions-rigging scandal wiped billions of pounds off the value of VW and tarnished its previously solid reputation for reliability and quality.

Mr Winterkorn has denied knowing about the pollution-cheating software, and issued a statement at the time of his resignation saying: "I am doing this in the interests of the company even though I am not aware of any wrongdoing on my part."

Dr Hans-Christoph Hirt, a director at fund manager Hermes, criticised VW's choice of corporate insiders to take charge of the company, saying the move "raises some real doubts whether the key shareholders have recognised the need for fundamental reform and a real new beginning".

He said: "Following intensive engagement with Volkswagen on corporate governance issues between 2006 and 2009, we have repeatedly raised concerns about aspects of Volkswagen's corporate governance.

"We plan to attend the Extraordinary General Meeting of Volkswagen on November 9 and on behalf of a group of investors will explain our concerns and suggest changes to the company's corporate governance and culture to other shareholders and the management and supervisory boards."

The news came as Audi announced that the device used in parent company Volkswagen's cars to manipulate emissions tests was also fitted in 2.1 million of its own luxury cars.

Of the 2.1 million autos, some 1.42 million diesel-powered Audi vehicles are registered in Western Europe, with 577,000 in Germany.

There are almost 13,000 cars containing the cheat software in the United States, a spokesman for Ingolstadt-based Audi said today.

The engine in question was built into 1.6-litre and 2-litre turbo diesel models in the A1, A3, A4, A6, TT, Q3 and Q5 ranges.

The cars involved have engines in the "euro 5" emissions category. Those with the newer "euro 6" engines aren't affected by the emissions scandal.

"We're working at full speed to find a technical solution," said Juergen de Graeve, a spokesman for Audi.

"Once we have that solution, we'll write to customers and we'll upgrade the cars so that they're within emissions regulations."

Skoda, which is also part of the VW family, has said that 1.2 million of its cars worldwide contain the software cheat, according to reports.

Volkswagen shares have fallen by more than 7pc so far today.

It has also emerged that VW has suspended the R&D chiefs of its core VW brand, luxury division Audi and sports-car maker Porsche, sources familiar with the matter told reporters.

The carmaker's supervisory board last Friday agreed to put a number of employees on leave until the details of affair were cleared up.

VW sparked global outrage last week when it admitted that 11 million of its diesel cars are fitted with special gadgets that activate pollution controls during tests but secretly turn them off when the car is on the road.

The deception has wiped billions off the value of the car giant and is set to land the German auto maker with substantial penalties and recall costs as governments and regulators around the world launch investigations - some of the criminal - into the scandal.

The nations carrying out probes include the UK, South Korea, India, Brazil, Australia, France, Italy, South Africa and Norway - whose economic crime unit has opened an investigation.

The US Justice Department has also launched a criminal probe.

Executives at VW have been accused of masterminding the emissions scandal from the company's headquarters in Wolfsburg.

The chain of command of those involved in the rigging deception stretched all the way back from the US to VW's home patch, it has been claimed, with executives in Germany controlling the key aspects of tests which the firm now admits were manipulated.

It was said that the cars that missed US emissions targets were reported to managers in Wolfsburg.
Testers at a California site evaluated vehicles and results were sent back to Germany before being passed to the US Environmental Protection Agency.

If any car failed to meet emissions targets, a team of engineers from Volkswagen headquarters or Audi's base in Ingolstadt was flown in.

UK Prime Minister David Cameron has condemned Volkswagen over its rigging of emissions tests.
"If companies are breaking the rules and fiddling their figures, that is unacceptable," Mr Cameron said as he flew to New York for a visit to the United Nations. "Emissions standards matter and they have to be properly policed and delivered."

Any move to restrict sales would be "all a matter for the Transport Department," he said.
German authorities have also demanded the carmaker present a timetable for fixing affected vehicles.

The regulators have asked VW to come up with a plan by October 7 to show when its cars will meet emissions requirements.

The German government has also insisted that it did not know about the rigged diesel emissions tests at VW before the story broke.

"The transport minister found out about the allegations of manipulation the weekend before last," a spokesman said.

"We had no previous knowledge that this system was being used."

Volkswagen has set aside €6.5bn to cover damages including fixes for the vehicles, potential regulatory fines and lawsuits, but the cost of the fallout is expected to be much larger.

The FBI in Detroit is reportedly handling a US criminal investigation of the German company, while 27 state attorney generals have unleashed a joint investigation into the blighted car maker.

Thse 27 states are reportedly going to send subpoenas to the company - these are essentially writs compelling testimony or evidence to be produced or face a penalty.

Private law firms are also lining up to take on VW, with a class action suit already being filed by a Seattle law firm.

The automobile giant already faces at least 60 lawsuits filed in federal courts in the US by consumers alleging the company committed fraud by cheating on emissions tests, which means their cars might not be as efficient as they believed them to be.

Dutch investor group VEB, which represents shareholders, has issued a liability claim against Volkswagen for the losses incurred by investors in the wake of the emissions fraud.

The group said: “The liability in question concerns the incorrect, incomplete and misleading information provided by Volkswagen…this manipulation kept the Volkswagen share price artificially high.

“In doing so Volkswagen acted unlawfully; not only towards car owners but also its own shareholders.”

Meanwhile, European environmental organisation, Transport & Environment, has said it has found some new models of Mercedes, Volkswagens, BMWs and other new cars consume much more petrol than lab tests claim, according to reports from PA.

The organisation said it had found no proof the cars are equipped with the same sort of "defeat devices" installed on diesel-powered Volkswagens, but called on European Union governments to broaden their probes into the scandal to cover petrol cars as well.

Both the EU and US have announced plans to crack down on the way car emissions are measured.

Currently, manufacturers test emissions in near-perfect lab settings, using smooth tyres unsuitable for roads, engine lubricants so expensive they're beyond the reach of most consumers and even clip off wing mirrors to achieve required emission results.
US regulators and the European Commission have both said they will introduce rules forcing manufacturers to test car emissions under real world road conditions.

The EU is expected to introduce new legislation in early 2106, although French ministers on Thursday called for this to be brought forward to before the end of the year.

New VW boss Matthias Mueller has pledged to win back the trust of customers.

"My most urgent task is to win back trust for the Volkswagen Group by leaving no stone unturned and with maximum transparency, as well as drawing the right conclusions from the current situation," he said on Friday.

Despite the turmoil at VW, the European Central Bank has not suspended the purchase of assets backed by VW loans, under its quantitative easing programme.

Contrary to reports over the weekend, the latest list of eligible collateral purchased by the ECB still includes securities issued by the carmaker.

What to do if you have Volkswagen affected by the emissions scan
BY NEWSMEDIAON SEPTEMBER 28, 2015

Regulators will add more spot-checks to cars already on the road as part of a toughening of USA environmental oversight following Volkswagen's admission that it fitted as many as 11 million diesel cars worldwide with software that rigged pollution tests.

The software tells a auto when it is under an official test, triggering emissions control systems that do not seem to be operating under normal driving conditions.

Volkswagen appointed Matthias Mueller as its new chief executive officer, to help the German automaker recover from a scandal over its rigging of USA vehicle emissions tests.

"We are not going to tell them what these tests are; they do not need to know", said Christopher Grundler, director of the EPA's Office of Transportation and Air Quality.

EPA officials insisted on a call with reporters Friday that the previous testing procedures were sophisticated and sufficient to accurately detect the emissions from the diesel cars as long as a manufacturer is not deliberating trying to cheat the process.

The EPA move comes amid a widening scandal over Volkswagen's diesel vehicles, as the automaker has admitted it installed a cheat device to remove nitrous oxide from exhaust emissions during lab testing. Volkswagen CEO Martin Winterkorn issued an apology, stating that he was "deeply sorry that we have broken the trust of our customers and the public".

The EPA's findings regarding the scandal saw that 482,000 cars in the U.S. were involved including the brands made by VW such as the Audi A3 and the VW models Jetta, Beetle, Golf and Passat.

The US Department of Justice (DoJ) has said that the United States would be taking part in an investigation by the Environmental Protection Agency (EPA) into the vehicle company.

Why did successive governments not discourage the proliferation of diesel vehicles which now account for about half of new cars in Britain?

The Air Resources Board sent a letter to all vehicle manufacturers Friday notifying them of the change that will be effective immediately.

Private owners of the 2009-15 VW and Audi models equipped with the violating 2.0-liter diesel may continue driving the cars, and do not have to do anything until Volkswagen of America and the EPA agree on a timeline for a recall.

The Academic Paper That Broke the Volkswagen Scandal
Last year, a group of researchers at West Virginia University uncovered one of the biggest frauds in automotive history while working under a small $50,000 grant.
BOURREE LAM 1:23 PM ET

Every day since the story first broke a week ago, the ripples of Volkswagen's scandal have extended further and further. Initially, the Environmental Protection Agency ordered Volkswagen to recall nearly half a million vehicles after discovering illegal devices intended to cheat emissions testing. Then, Volkswagen announced the number of vehicles affected is closer to 11 million worldwide—and that the company has set side $7.2 billion to fix the problem. Volkswagen's CEO at the time, Martin Winterkorn, soon resigned.

The company's board is expected to pick Matthias Mueller, the chief executive of Porsche, to take over. There are reportedly nearly 30 class-action lawsuits pending from car owners in all 50 states, plus 5 provinces in Canada. All these furious drivers bought their cars believing that they were highly fuel-efficient—which appears to not be the case, affecting their resale values significantly.

But how did this whole thing begin? At a small lab in West Virgina, it turns out. In 2012, a group of researchers at West Virginia University won a $50,000 grant from the International Council on Clean Transportation to do performance testing on clean diesel cars. Arvind Thiruvengadam, a research assistant professor in mechanical and aerospace engineering, told NPR this week that the team was merely excited do the research—which involved driving the clean diesel cars outside the lab—and write a journal paper based on the data. They never expected that they would discover one of the biggest frauds in automotive history.

When Thiruvengadam and his colleagues tested Volkswagen's clean diesel cars, they found discrepancies up to 35 times the expected emissions levels. The researchers suspected cheating, but couldn't be sure. David Carder, another researcher on the West Virginia University team, told Reuters that the fallout at hand is surprising because this data was made public over a year and a half ago.

The stakes were upped when the Volkswagen cars in question were tested by the California Air Resources Board (CARB) in an investigation starting May of last year, and the CARB and EPA started discussions with Volkswagen on why there were such discrepancies. Volkswagen insisted to EPA officials that the discrepancies were due to a technical issue rather than deliberate cheating. Only when the EPA threatened not to approve Volkswagen's 2016 clean diesel cars for sale in the U.S. did the company finally fess up.

Volkswagen will survive this scandal (even though its stock has plunged 30 percent, wiping out a quarter of its market value), but now the future of diesel cars are at stake and it's expected that the consumers who wanted clean diesel cars for their greenness will likely switch to hybrids, while those who care for performance might try to dodge the recall. Either way, Volkswagen will be held responsible for clean diesel's coming existential crisis.

Does EPA's Response To Volkswagen's Emissions Cheating Go Far Enough?
By Cole Stangler

Auto regulators are now on the offensive after being deceived by Volkswagen for years. They unveiled a response Friday to the company's stunning admission that it systematically cheated on emissions tests from 2009 to 2015. In a letter to automakers, the U.S. Environmental Protection Agency said it will bolster testing procedures to detect so-called defeat devices like the ones Volkswagen used to shut down pollution control systems outside of testing conditions.

Jesse Prentice-Dunn, a policy analyst at the Sierra Club, applauds the move. But he says "long-term" fixes are still needed. "The testing regime needs to be revamped."

Critics have long said as much. Under the current testing system, automakers in the United States conduct their own examinations and report the data to federal officials. The EPA, meanwhile, conducts spot checks, but its resources are stretched thin.

Dan Becker is the director of the safe climate campaign at the Center for Auto Safety. For companies to respect emissions standards, he says, officials need to remove the tests from private hands and transfer them to labs with federal supervision. "Right now, you've got the foxes in control of the chicken coop, and that's never going to be a good show."

In an ideal world, Becker says, automakers would simply follow the law. But in the last few decades, companies have shown a remarkable penchant for gaming the standards, and the current structure of the testing system makes it exceedingly easy to do so.

"If these companies were being honest, we wouldn't need an elaborate system to make sure they don't cheat," Becker said. "But they've proven that they do cheat." Not just Volkswagen -- but "virtually every major automaker," he asserted.

A History of Gaming The System

It started in the 1970s, just after the EPA was created and began to regulate auto emissions under the Clean Air Act. Volkswagen, in fact, was among the first to equip its cars with defeat devices to override emissions control systems. In 1973, it confessed to installing them on 25,000 cars. The following year, Chrysler was forced to recall more than 800,000 cars after it was found to have installed a similar device in radiators.

The 1990s saw a couple of major scandals. In 1995, General Motors settled with the Justice Department and the EPA for $45 million, acknowledging it installed a computer chip in 500,000 Cadillacs that tripled the amount of carbon monoxide output when the cars' heating and cooling systems were running. Three years later, Caterpillar, Mack Trucks and Volvo Trucks reached a similar settlement, worth $1 billion, for equipping trucks with defeat devices.

Kia and Hyundai followed suit more recently. Last November, the South Korean

corporations copped to overstating fuel economy standards on 1.2 million cars from 2010 and 2012, settling with the Justice Department and the EPA for $300 million.

A representative for the Alliance of Automobile Manufacturers, a trade group that represents automakers operating in the United States, declined to comment.

What Is To Be Done?

The Sierra Club's Prentice-Dunn says one path to reform could simply be to increase the number of spot checks. Indeed, Christopher Grundler, director of the EPA's Office of Transportation and Air Quality, recently told the Associated Press that the agency may soon do this.

Grundler was less forthcoming about the EPA's plans to enhance detection of defeat devices -- the subject of Friday's letter to automakers. On a call with reporters, he wouldn't say what changes the agency is enacting to audit lab results submitted by car companies.

"They don't need to know," he said, of the automakers. "They only need to know that we will be keeping their cars a little bit longer, and we're going to driving them more."

Becker says more oversight is a good step, but regulators need to go further by eliminating their reliance on companies' test data altogether.

"This is an industry that has proven it's not trustworthy," said Becker. "The EPA shouldn't trust them when they say, 'our vehicles meet your standards, everything's just peachy keen.' The government needs to set up a better testing system and not rely on the auto companies' assertions."

He's not sure exactly how that would look -- whether it would be in-house or conducted at independent labs with federal supervision -- either way, he says, it would need to be firmly outside the control of companies. Taxpayers, in theory, could cover a portion of the cost, but companies should be forced to foot most of the bill.

Congressional Republicans, who have made frequent targets of the EPA, would likely oppose such a plan. Since 2010, the agency has seen its budget decline by a fifth, or about $2 billion. Earlier this month, 20 Republican members of Congress filed articles of impeachment against Gina McCarthy, head of the agency.

Luke Tonachel, director of clean vehicles and fuels at the Natural Resources Defense Council, says all this makes it harder for the agency to do its job. "If the EPA's resources are constantly under attack, it's only gonna be harder for them go out and catch the cheaters."

Fortune:
http://fortune.com/2015/09/25/gm-volkswagen-emissions/

Former GM Vice Chair: "I almost feel sorry" for Volkswagen
by Chris Matthews

Bob Lutz says the competition wondered how VW could get low emissions cheaply

For six years, Volkswagen has been installing software in its cars to help them cheat on EPA emissions test. As former GM Vice Chair Bob Lutz told CNBC Friday, the rest of the industry was wondering just how the company was able to get clean emissions so cheaply.

Lutz said that he consistently pressed his engineers to figure out what his competitor was doing, ""They said, 'We can't answer that question," according to Lutz. "Honda asked the same question. They couldn't figure it out either because with near identical engines and hardware from the same suppliers, they could not get themselves to pass."

Lutz also predicted that to fix the problem will be, "incredibly expensive" after factoring in government fines and consumer lawsuits for complaints like loss of value. He even went so far to say that he "almost" feels sorry for his former competitor.

Volkswagen Whistleblower: "We Gave EPA The Diesel Emissions Data In 2014"
By Mike Brown

The Volkswagen scandal has shaken the automotive world. It all started with two men: Peter Mock and John German. The pair worked with West Virginia University to try to show that clean emissions tech doesn't necessarily effect automotive performance. Instead, they discovered that the chosen cars were pumping 40 times more emissions into the air than they were supposed to. They submitted their findings to the California Air Resources Board and the federal Environmental Protection Agency.

This week, German, senior fellow at the International Council on Clean Transportation, suddenly became one of the key figures in a story about how the global car manufacturer had cheated on EPA emissions tests. The shocking revelations have had widespread impact on the industry and started an international conversation on emissions testing. They also cost Volkswagen CEO Martin Winterkorn his job. Here, German speaks to International

Business Times about how Volkswagen got away with it, the wider implications, and what happens next.

International Business Times: Now, as I understand it, Volkswagen was using a "defeat device" to measure the conditions of the car, but this wasn't actually a device. It was a piece of software, correct? What was that software measuring for?

John German: We don't know. You are correct it is software, it has to do with the computer looking for the conditions under which test procedure was conducted, and if it detects the conditions, the emission controls behave the way they were designed. But if it does not detect those conditions, it switches to a different control where it reduces the effect of the system. The specifics as to how they reduce effectiveness, though, we don't know. There's quite a number of ways they could detect how they could see that the car was being tested.

IBT: Who could have known about this?

German: One aspect that's really interesting is that we turned data and report over to CARB and the EPA back in May 2014 and they discussed the problems with Volkswagen. Then in December 2014, Volkswagen issued a field fix, and they reflashed the computers in the cars to install the field fix. A few months later they assessed, and found the defeat device was still in the field fix. That is incomprehensible to me, so the interpretation is that this was only a relatively small part of the company.

IBT: Is this something that's ever happened before?

German: There have been a number of other defeat device cases. The best-known case was in the late 1990s with heavy-duty engine manufacturers, ones for really big freight trucks. They did something similar; they were concerned with driving long distances. So they looked for a steady state highway speed for more than x mins, after which they would change calibrations, pushing the NOx up.

IBT: But I'm assuming before they didn't have as advanced computers and electronics. How did they control it before?

German: The systems were simpler. Before NOx after treatment, it was all in calibration. One example of this was what's known as exhaust gas recirculation. That was the first step of control. You could put in one of those to reduce NOx, but it would also increase fuel consumption, so you could switch it off.

IBT: When will we find out what Volkswagen was doing? Are we talking more in months or years?

German: We will only find out if CARB or EPA reveal it. It might be part of the settlement with Volkswagen, as part of the legal agreement. There is a good chance that the EPA will release the info, but we're probably talking more in months. At this stage, though, it's definitely in Volkswagen's interest to get it fixed and behind them as fast as possible.

IBT: Could we conduct tests to find out for ourselves how Volkswagen were doing this?

German: Maybe. It would be difficult. The kind of time and expertise it takes to reverse-engineer calibrations ... these computers are really powerful and complex, and it would take a large amount of time and expertise.

IBT: But we know the car was looking for certain conditions. What are these conditions they could have been measuring for?

German: There are several factors. On an official test the non-drive wheels don't spin, the front wheels do not turn. The test is run at a consistent ambient temperature. It's always run with a cold engine, and the test has a defined speed trace, i.e. the speed for each second. Volkswagen could have looked for any of those.

IBT: Thank you for your time, this has been very interesting. Is there anything else you wanted to say about this that you don't think we covered?

German: The main point is that governments need to do a better job of oversight and enforcement. Worldwide, in China, India, Brazil ... the primary lesson is that there needs to be better oversight and more data.

CBC News (Canada):
http://www.cbc.ca/news/business/volkswagen-emissions-testing-1.3243656

EPA works with Canadian regulators to retest VW vehicles
U.S. regulators warn they will revamp testing protocols after learning of VW cheat device

The U.S. Environmental Protection Agency is looking to revamp the way it tests emissions for all automobiles in the wake of the scandal over Volkswagen's manipulation of emissions data.

The EPA will also be working closely with Environment Canada, which has an "excellent laboratory," to co-ordinate widespread testing around the Volkswagen emissions, EPA officials said in a conference call on Friday.

Affected vehicles have yet to be recalled, but the EPA said it is looking for "recall solutions." Part of the problem is that there is no fix that won't negatively impact vehicle performance.

An estimated half million vehicles in the U.S. are affected, with Environment Canada estimating 100,000 VW diesels are in service in Canada.

The EPA said it is sending a letter to automakers outlining plans for more extensive testing of all vehicle models.

That echoes an initiative by European regulators, who plan to move in 2017 to a system of road testing for vehicle emissions standards.

Light commercial trucks

The EPA move comes amid a widening scandal over Volkswagen's diesel vehicles, as the automaker has admitted it installed a cheat device to remove nitrous oxide from exhaust emissions during lab testing.

On Friday, Germany's transport minister said that light commercial trucks made by Volkswagen appeared to have the same software geared toward cheating on U.S. emissions tests.

Transport Minister Alexander Dobrindt told lawmakers Friday that 2.8 million vehicles in Germany may be affected.

Meanwhile, Daimler AG, the maker of Mercedes cars, is rejecting claims by a German environmental group that it appears to have been involved in manipulation of emissions data.

The Deutsche Umwelthilfe group said Friday it had information that almost all German manufacturers of diesel cars exceed emissions limits and speculated that the cars were declared road-worthy by regulators because of cheat devices.

"We sharply deny the allegation that we manipulated our cars during emissions tests. We never did and do not now use a defeat device," Daimler said in a statement.

Questions over emissions testing

Volkswagen cars as far back as 2009 are equipped with the defeat software that is geared toward passing emissions standards.

The revelation has put the EPA, and testing agencies around the world, on the alert.

Chris Grundler, head of the EPA's office of transportation and air quality, was clearly on the defensive, saying the EPA had left it to European regulators to do more extensive tests of diesel as the fuel is in wider use there.

It wasn't the EPA that uncovered the high nitrous oxide emissions from VW diesel cars, but the International Council on Clean Transportation (ICCT), a nonprofit research organization based in Virginia.

"Do I wish we had uncovered it sooner? Absolutely," he said.

VW was able to fool the EPA because the agency only tested the cars on treadmill-like

devices called dynamometers and didn't use portable test equipment on real roads. The software in the cars' engine-control computers checked the speed, steering wheel position, air pressure and other factors to determine when dynamometer tests were under way. It then turned on pollution controls that reduced the output of nitrogen oxide, an ingredient in harmful ozone, the EPA has said.

The agency does have on-road testing equipment, but it is used to monitor automaker gas mileage estimates and heavy-duty diesel trucks, which create more emissions.

"It's not a question of equipment or technology or capability. It's a question of where we deploy those resources," Grundler said.

Any new testing will include investigations that will uncover any software designed to fool emissions testers, Grundler said.

More extensive road testing is also on the way, he warned automakers, though he did not specify exactly which tests the EPA plans.

The scandal has also exposed holes in the European testing system, where tests are done in laboratory conditions on special pre-production models provided by the manufacturers. Norway, France and Italy announced moves today to investigate VWs sold in their countries.

Europe's tests have not been upgraded since 1996 and critics say its testing is less rigorous than North American testing.

The EU has proposed real-world testing from 2017, with new proposals to close loopholes and design testing to more closely resemble real-world road conditions.

ICCT testing of diesel cars hints at trouble for many automakers around diesel emissions, with poor results for Volvo, Renault and Hyundai as well as Volkswagen.

EPA expands emissions tests in wake of VW scandal
By Greg Gardner
The EPA also will test diesel vehicles produced by other automakers.

The U.S. Environmental Protection Agency will introduce new tests to detect devices like the one Volkswagen used to cheat on its emission test to comply with the Clean Air Act, agency officials said today.

The German automaker said Matthias Mueller, currently the head of its Porsche unit, will become CEO, replacing Martin Winterkorn who resigned earlier this week because of the emissions cheating scandal.

The EPA apply the new regimen to diesel vehicles produced by other automakers. The agency is also asking owners to allow EPA researchers to test their diesel vehicles to learn more about how the German automaker disguised their violations, that could lead to a fine of up to $18 billion in the U.S. alone. More broadly Volkswagen has said 11 million vehicles worldwide used some type of software to game various countries' environmental standards.

"We're going to adapt new practices and more demanding tests to improve our enforcement," said Chris Grundler, director the EPA's office of transportation & air quality. "We are not going to tell manufacturers what these new tests are. They don't need to know."

In the U.S., the EPA found that 482,000 Volkswagen cars sold between the 2009 and 2015 model year used a defeat device when testing the vehicles.

They include:

Jetta (model years 2009-15)
Beetle (model years 2009-15)
Audi A3 (model years 2009-15)
Golf (model years 2009-15)
Passat (model years 2014-15)

Without the defeat devices, which were deactivated after Volkswagen met the emission requirements, the VW and Audi vehicles were emitting nitrogen oxides (NOx), a greenhouse gas, at levels up to 40 times the permissible standard.

Grundler and Janet McCabe, EPA acting assistant administrator for the office of air and radiation, asserted that neither their agency nor the California Air Resources Board, which can also penalize Volkswagen and Audi, don't allow any manufacturer to "self-certify," or conduct their tests without regulatory involvement.

EPA and CARB uncovered the defeat device software after independent analysis by researchers at West Virginia University, working with the International Council on Clean Transportation, a nongovernmental organization.

Grundler said EPA has the money and staff to expand its emission testing.

"We have the equipment. We have the people. We have 23 of these measurement systems and they are not cheap," he said.

Washington Post:
http://www.washingtonpost.com/business/economy/epa-to-begin-more-rigorous-testing-of-all-diesel-cars-after-vw-scandal/2015/09/25/f20fa39a-6393-11e5-8e9e-dce8a2a2a679_story.html

EPA to begin more rigorous testing of all diesel cars after VW scandal
By Thad Moore

Federal regulators are launching more aggressive testing of diesel-engine cars across all manufacturers in the wake of the Volkwagen emissions-cheating scandal, the Environmental Protection Agency said Friday.

The EPA also says it will add additional tests designed to ferret out "defeat devices" like the software VW used to circumvent emissions tests.

The agency had been focused its diesel testing on big-rig trucks because they are more common than diesel cars and account for more pollution in the U.S., said Christopher Grundler, director of the EPA's Office of Transportation and Air Quality.

The EPA will begin testing cars Friday, Grundler said, and it will seek out test vehicles from rental car fleets and consumers. The agency doesn't know how long the testing would take, but Grundler said it is working with regulators in California and Canada to speed the process.

VW acknowledged that 11 million of its vehicles worldwide, including nearly 500,000 in the United States, were involved in a deception that allowed the vehicles to pass emissions tests while emitting nitrogen oxide at up to 40 times the federal standard. Its' CEO, Martin Winterkorn, stepped down this week and the company is under criminal investigation and faces billions in fines. VW also set aside more than $7 billion to fix the problems with its cars and begin to repair its reputation with customers.

Neither the EPA nor Volkswagen have said how long it will take to fix the nearly half-million cars in the U.S. with defeat devices. But it expects cars in the 2015 model year will be patched "relatively quickly," Grundler said.

Older versions of the Passat should be fixed soon after that, but other models will take longer because designing a solution "will require additional engineering development that will take longer," Grundler said.

US News & World Report:

EPA Beefing Up Emissions Tests in Wake of VW Scandal

The agency also says it plans to test gasoline and diesel vehicles that are on the road today.

By Alan Neuhauser

One week after Volkswagen copped to cheating on federal emissions tests of popular VW and Audi "clean-diesel" cars, the Environmental Protection Agency sent a letter to vehicle manufacturers Friday announcing it was toughening its emissions tests. The agency also will be launching audits of every current make and model of light-duty diesel passenger vehicle, reflecting concern that cheating might be widespread.

The expanded checks will include on-road testing to better emulate real-world driving conditions. Some critics had previously alleged that the tests were outdated and easily outsmarted. The new audits will also include gasoline vehicles, an EPA official said

In this photo taken Feb. 14, 2013, a Volkswagen logo is seen on the grill of a Volkswagen on display in Pittsburgh. The Environmental Protection Agency (EPA) says nearly 500,000 Volkswagen and Audi diesel cars built in the past seven year are intentionally violating clean air standards by using software that evades EPA emissions standards.

RELATED

Volkswagen Sees Billions Erased From Market Value After Rigging Claims

The agency also confirmed that affected VW and Audi vehicles – diesel Passats, Jettas, Beetles, Golfs, and A3s, together numbering around 500,000 cars in the U.S. – would be recalled as the German auto group devises solutions to make the cars compliant with U.S. air standards.

"These violations are very serious," Janet McCabe, acting assistant administrator for the EPA's Office of Air and Radiation, said during a call with reporters. "VW was concealing the acts from EPA, from the state of California, and from consumers."

The California Air Resources Board tests vehicle emissions and was among the groups that uncovered the cheating regimen.

Volkswagen Group CEO Martin Winterkorn resigned Wednesday amid the continuing fallout from the scandal, stating he was "shocked by the events of the past few days" and "stunned that misconduct on such a scale was possible in the Volkswagen Group."

VW and Audi may ultimately face a penalty of up to $18 billion, or $37,500 per vehicle in violation. By comparison, Hyundai and Kia were penalized $300 million last year for overstating vehicles' fuel economy and greenhouse gas emissions.

The Justice Department has also reportedly opened a criminal investigation of Volkswagen

AG.

EPA officials intimated that they expected VW and Audi penalties – as well as the expanded audits – to reflect the flagrancy of the violations. The cars, from model years 2009 through 2015, contained "defeat devices" buried in the software governing their engine controls. These lines of code automatically reduced emissions of nitrous oxide, or NOx, during tests, then switched off the restrictions during normal driving.

The cars were found to emit as much as 40 times the legal limit of NOx, the EPA said, which causes smog and a range of health problems. With 11 million of the vehicles on the road worldwide, one "back-of-the-napkin" calculation by Vox's Brad Plumer found they churned out as much as 20 times the NOx of a typical power plant, contributing to anywhere from dozens to hundreds of premature deaths.

"The facts before us show us that this firm sadly developed a very sophisticated scheme to defeat this test using software very deep in the engine control," Christopher Grundler, director of the EPA's Office of Transportation and Air Quality, said during Friday's call.

The EPA is partnering with the California Air Resources Board and bringing about Environment Canada – that nation's version of the EPA – to carry out its audits of gas and diesel vehicles. The agency said it would test cars from private owners who volunteer, as well as vehicles from rental companies. Officials declined to speculate how long the testing would take or how much it would cost the agency, but did acknowledge that expected recalls of VW and Audi vehicles would take longer for older models.

"We expect the first generation of vehicles, all pre-2015 vehicles except for the Passat, will require additional engineering … that will take longer," Grundler said.

VW's four-cylinder diesel vehicles for 2016 also have not yet received required emissions certification from the EPA because officials aren't yet certain the vehicles will perform as required.

The EPA's testing procedures date to 1975 and were most recently updated in the "early 2000s," Grundler said, when they were expanded to reflect aggressive driving, high-speed driving, and driving in hot and cold weather.

In light of the VW and Audi practices, he added, "we are going to be adopting some new approaches and new tests as a continuous improvement of our oversight."

CNBC:
http://www.cnbc.com/2015/09/25/epa-expect-range-of-penalties-for-vw-amid-scandal.html

EPA: Expect range of penalties for VW amid scandal
Fred Imbert

The Environmental Protection Agency said Friday it will be cracking down on Volkswagen after the German automaker admitted it added software on its vehicles to deceive emissions tests.

The EPA said it will hit the company with a range of penalties as a result of the investigation, but added that it has not issued a recall since the discovery.

"We are upping our game," Chris Grundler, head of transportation and air quality at the Environmental Protection Agency, told reporters in a teleconference.

The automaker, one of the largest car companies in the world, could face fines of $37,500 per vehicle in the U.S., the EPA said last week. With around 482,000 of its diesel vehicles sold in the U.S. since 2008, this could mean a penalty of up to $18 billion.

Rain clouds are seen over a Volkswagen symbol at the main entrance gate at Volkswagen production plant on September 23, 2015 in Wolfsburg, Germany. Volkswagen CEO Martin Winterkorn and other members of the supervisory board are believed to be meeting inside the headquarters to discuss the Volkswagen Diesel emission scandal, which affects 11 million vehicles worldwide.

Europe's carmakers caught up in VW storm
The agency also said it has already begun new testing of all diesel-powered vehicles, and is planning even more new tests.

The EPA said it will improve its ability to detect so-called defeat devices or software that can reduce emissions during testing. But it will not tell automakers specifically how it is improving the testing.

"They don't need to know," Grundler said.

It added that the vehicles are safe to drive. Nevertheless, it also said these events make it clear it needs to improve its oversight over automakers and that Canada's Department of the Environment would be an active partner in testing vehicles more quickly.

Volkswagen German-listed shares have fallen nearly 30 percent in the last week, according to FactSet.

VW cheating scandal prompts EPA to widen testing of diesel cars
By JERRY HIRSCH

Working with regulators in California and Canada, the Environmental Protection Agency launched a new testing program Friday to look at the emissions from every make and model of diesel passenger cars on U.S. roads.

The increased oversight is a response to the discovery earlier this month that Volkswagen was using sophisticated software to cheat on pollution tests on 482,000 diesel vehicles sold in the U.S.

The automaker, which faces a federal criminal investigation and other regulator sanctions, admitted cheating and said the software could be on as many as 11 million vehicles worldwide.

"Clearly this is a concern for air quality and public health," said Janet McCabe, acting assistant administrator of the EPA office of air and radiation. "The Volkswagen violations before us now show that we must continue to improve our oversight."

Both the California Air Resources Board and the Environment Canada will join in the testing.

"This will allow us to move more quickly to test more models," said Christopher Grundler, director of the EPA's office of transportation and air quality.

The agency sent a letter Friday to all automakers explaining that their vehicles will undergo extra scrutiny.

The EPA said it now will test or require testing on any vehicle in a setting that emulates normal driving specifically for investigating the presence of a so-called defeat device, the industry term for systems that hide a vehicle's true emissions.

This will be in addition to the five standard emissions tests all new vehicles undergo and may require additional time, the agency said.

The agency and its partners also will use portable devices to measure the real life emissions of vehicles as they are driven on open roads, Grundler said.

Environmental groups welcome testing expansion and said it will deter other automakers from evading emissions regulations.

"EPA is on the job," said Luke Tonachel, director of clean vehicles and fuels project at the Natural Resources Defense Council. "This expansion of testing will is another signal that cheating will not be tolerated."

There is no evidence at this point to suggest that any other companies are cheating.

After tips from researchers in Europe and the University of West Virginia, California and federal regulators discovered that VW had buried an algorithm in 100 million lines of computer code in its vehicle electronics that allows the cars to emit up to 40 times the legally allowed amount of nitrogen oxide.

The cars met environmental regulations when tested on a dynamometer -- a kind of treadmill for vehicles -- in a laboratory. But they spewed pollution when driven on roads.

VW's software senses the testing environment by analyzing a variety of data -- steering position, speed, duration of engine operation, barometric pressure and changes in the car's performance.

The affected cars are the 2009 to 2015 Volkswagen Jetta TDI, 2009 to 2014 Volkswagen Jetta SportWagen TDI, 2012 to 2015 Volkswagen Beetle TDI, 2013 to 2015 Volkswagen Beetle Convertible TDI, 2010 to 2015 Audi A3 TDI, 2010 to 2015 Volkswagen Golf TDI, 2012 to 2015 Volkswagen Passat TDI, 2015 Volkswagen Golf SportWagen TDI.

Additionally, Volkswagen suspended new and used sales of the all 2.0-liter TDI four-cylinder diesel engines, including 2015 Beetle, Jetta, Golf, Passat TDI, as well as the Audi A3 TDI. Sales of VW's 2016, 4-cylinder diesel models are held up as they await EPA certification.

Grundler said the EPA is working with Volkswagen to evaluate potential remedies for the diesel vehicles' emission systems. The 2015 models will be the first fixed, followed by the 2012-15 Passats.

Because the range of cars affected include three generations of diesel engines, the remedies for the other vehicles could take much longer to develop.

Other automakers said they are ready for more rigorous testing of their diesel vehicles.

"We are prepared for testing," said Annalisa Bluhm, a GM spokeswoman. "We are not changing our diesel strategy as a result of what is going on with Volkswagen."

The automaker sells diesel pickup trucks and a diesel version of the Cruze sedan.

Bluhm said GM is "committed to the robust emissions compliance of all our vehicles" and expects its employees to know the regulations and "act legally and ethically."

Only about 3% of all autos and light truck sales involve diesel power trains.

According to the Diesel Technology Forum, there are 39 diesel-powered passenger vehicles being sold in the U.S. Those are made by Audi, BMW, Chevrolet, Jaguar, Jeep, Land Rover, Mercedes-Benz, Porsche, Ram and Volkswagen.

Get our weekly business news briefing >>
That number will grow, the forum said, by 15 more vehicles within the next year. Among the new entries will be light trucks from GMC, Chevrolet and Nissan.

Meanwhile, other German automakers issued statements saying that they have not gamed emission testing for their diesel offerings.

BMW said it observes "the legal requirements in each country.... Our exhaust treatment systems are active whether rolling on the test bench or driving on the road."

Mercedes-Benz said that it has never used defeat devices to evade testing, in response to allegations by a German environmental group that other automakers' diesels also exceed smog-forming nitrogen oxide emissions. The company said it sticks to all laws and rules and isn't aware of any measurements showing that its vehicles fail to keep to legal requirements.

Mercedes said it supports efforts to develop new testing methods to measure emissions based on real driving conditions.

The VW cheating scandal prompted the resignation of the automaker's chief executive, Martin Winterkorn. The company is expected to name a new CEO later Friday or in the coming days.

Financial Times:
http://www.ft.com/intl/cms/s/0/8c6d5aec-6392-11e5-a28b-50226830d644.html#axzz3mgG3bZd2

EPA warns other carmakers it will test for defeat devices
Chris Bryant in Frankfurt and Barney Jopson in Washington

The US environmental regulator put all vehicle manufacturers "on notice" on Friday that it will intensify its emissions testing on diesel-powered vehicles to discover whether "defeat devices" were being used more widely.

Janet McCabe, acting assistant administrator of the Environmental Protection Agency, told reporters: "We are stepping up our testing activities in response to VW's alleged violation."

The new testing regime will start immediately and Christopher Grundler, director of the EPA's office of transportation and air quality, said that for manufacturers it meant "we'll be keeping their vehicles a little bit longer and driving them more".

The EPA's announcement came as Volkswagen's board gathered to appoint a new chief executive to lead the carmaker, with Matthias Müller, head of Porsche, widely viewed as the favourite candidate.

The supervisory board meeting at VW's Wolfsburg headquarters follows Martin Winterkorn's resignation after eight years at the helm of the group.

Mr Müller is close to the Porsche and Piech families, who together control a majority of VW's voting shares, knows Volkswagen inside out and has a reputation for speaking his mind. The company declined to comment.

The board is also expected to decide on Friday which managers must leave the company over the scandal, with attention focusing on high-level engineers and designers.

VW has been reeling since the EPA revealed last Friday that the group had rigged its diesel cars to pass emissions tests, potentially laying itself open to criminal charges and substantial fines.

The EPA said that VW had installed defeat device software that turned off emissions controls during regular driving and turned them on during an emissions test. The software meant cars emitted up to 40 times the amount of nitrogen oxides that US environmental standards allow.

The EPA said 482,000 vehicles sold in the US since 2008 were affected, but VW later raised that figure to 11m worldwide. It said it would take a €6.5bn charge to cover the costs of the crisis.

A senior official at the EPA told the Financial Times that Volkswagen had orchestrated an unprecedented effort to beat the EPA's rigorous testing regime. "The level of deceit the company went through to game the system was enormous," the official said.

The EPA operated a cutting-edge testing regime to police compliance with clean air regulations, the official said, and it took an "elaborate, aggressive, ongoing, co-ordinated effort" to beat it. "We've seen uses of defeat devices, but nothing to this scale," the official added.

Forbes:
http://www.forbes.com/sites/neilwinton/2015/09/25/vw-struggles-to-agree-new-ceo-but-heres-some-advice-for-the-eventual-incumbent/

VW Struggles To Agree New CEO, But Here's Some Advice For The Eventual Incumbent
Neil Winton ,CONTRIBUTOR

A meeting in Wolfsburg, Germany, of Volkswagen executives to appoint a new CEO was dragging on into the evening, suggesting a lack of agreement on who should replace Martin Winterkon.

Winterkorn resigned this week in the wake of the scandal in which VW duped the EPA with

false diesel data. VW's shares dived on stock markets, and the company's 20-member supervisory board is apparently torn between appointing the media favourite Porsche CEO Matthias Mueller or VW brand chief Herbert Diess to replace Winterkorn.

Max Warburton, analyst with Bernstein Research, said Diess was his first choice.

"He's the best candidate if VW wants to show everyone – internally and externally – that the regime has changed," Warburton said.

Diess was recently hired from BMW so is not tainted by any of the VW scandals.VWLogo.jpg

"Diess would also be the best choice for shareholders who would like other changes after the EPA scandal has been dealt with. Our second vote goes to Hans Dieter Poetsch. He would be a good option in the short-term as VW needs an eloquent, unflappable face to put in front of U.S. Congress and media," Warburton said.

Poetsch, currently VW's finance chief, was nominated earlier this month as the replacement for Ferdinand Piech as Chairman of the board. Poetsch faces a shareholder vote in November to confirm his appointment.

Whoever gets the new CEO job should do the following, Warburton said.

Offer to buy back and scrap every 2.0 diesel sold in the U.S. – all 482,000 of them – cost $6 billion.

Announce that VW will henceforth abandon all efforts to sell diesel engines in the U.S., but will embrace gasoline and plug-in hybrids.

Send the new CEO to the U.S. Monday to meet government officials, the EPA and media.

Announce the immediate suspension of the 100 engineers most closely linked with the engine and software development.

Announce the cessation of all motorsport activities immediately, turning all the funding over the electric, plug-in hybrid and environmental research in a new research facility located in the U.S. employing U.S engineers.

CNN:

EPA to automakers: We'll test everyone for VW problems
By Chris Isidore and Ahiza Garcia @CNNMoney

Federal regulators are putting U.S. automakers on notice.
The EPA said Friday it will test emissions at every automaker to make sure no other company is trying to dodge pollution regulations like Volkswagen did.

The agency will send a letter to all manufacturers to notify them that it's stepping up its emissions policing.

The EPA said it will test every model of diesel car, SUV and pickup that's now on the road in the U.S. The testing won't include large vehicles such as semi-tractors and buses, which also use diesel.

It added that the new testing procedures will be more vigorous to prevent automakers from cheating, and will more closely approximate the emissions from a vehicle in real-world driving conditions.

Last week, the EPA found that Volkswagen had falsified pollution tests on 482,000 VW and Audi diesel cars in the U.S.

Those models include the VW Jetta, the Passat from 2014-2015, the Beetle and the Golf from 2009 through 2015, and the Audi A3, model years 2009-2015. Audi is owned by Volkswagen (VLKAY) Group.

Volkswagen manipulated software so its cars would seem cleaner when they were being tested. But when they were on the road, the cars pumped out nearly 40 times the legal level of nitrogen oxide. Volkswagen has since admitted it cheated.

EPA officials insisted on a call with reporters Friday that the previous testing procedures were sophisticated and sufficient to accurately detect the emissions from the diesel cars as long as a manufacturer is not deliberating trying to cheat the process.

Since the EPA plans to test older cars that are no longer available from the manufacturers, the agency said it will borrow cars from individuals as well as businesses, such are rental car companies, which own the vehicles it wants to test.

Volkswagen's directors are meeting Friday to name a new CEO after Martin Winterkorn stepped down earlier this week.

Winterkorn said he was unaware of the emissions cheating and apologized for the possible data manipulation in roughly 11 million cars worldwide.

VW has had to set aside €6.5 billion ($7.3 billion) to deal with the issue, but the final total could far exceed that. The automaker is also facing criminal probes from U.S. state attorneys generals and possibly the federal government. The EPA could impose a civil penalty of $37,500 per violation, which would come to $18 billion.

Volkswagen's share price has plunged 50% in the wake of the scandal.

Newsweek:
http://www.newsweek.com/epa-volkswagen-emissions-defeat-device-retest-announcement-376641

EPA to Begin Retesting All Light Diesel Cars on the Road for Defeat Devices
BY ZOË SCHLANGER

The search for more "defeat devices" installed in cars and meant to cheat emissions tests has begun. The U.S. Environmental Protection Agency announced on Friday it would begin systematically re-testing all models of light diesel vehicles currently on the road in the U.S. The goal is to weed out any other potential defeat devices following the discovery that Volkswagen designed and installed software in their cars that for years tricked the EPA's testing system.

"Today we are putting vehicle manufacturers on notice" that there will be additional testing to look for defeat devices, Christopher Grundler, director of EPA's Office of Transportation & Air Quality, said on a call with reporters Friday. "We aren't going to tell them what these tests are, they don't need to know. They only need to know we will be keeping their cars a little bit longer, and driving them a little bit more."

EPA maintains that it has the necessary expertise and equipment to detect defeat devices. However, the regulator did not catch Volkswagen's alleged fraud on the U.S. portion of the 11 million cars globally that contained the defeat device. The cars range from model years 2009 to 2015. According to EPA, the cars 'knew' when they were being tested for emissions, and were able to temporarily present much lower emissions than they did while on the road.

"As you know, the company, very deeply, within 100 million lines of software code, had a very specific algorithm to defeat the test," Grundler said. "They developed a very sophisticated scheme to defeat the test. It was a deliberate attempt to have two calibrations on the vehicle."

Each VW car was able to emit up to 40 times the allowed amount of NOx. EPA still has not calculated the additional amount of NOx the cars contributed to the atmosphere, but Janet McCabe, EPA's acting assistant director, said the agency "need[s] to address this." One estimate puts the number at between 250,000 to 1 million extra metric tons of NOx pollution per year, according to The Guardian.

NOx emissions have been found to contribute to respiratory illness and heart disease as well as early death.

Buzzfeed News:
http://www.buzzfeed.com/danvergano/volkswagen-deception-spurs-epa-to-start-defeat-

device-tests#.huywrmMbNN

Volkswagen Deception Spurs EPA To Start "Defeat Device" Tests Of All Cars
The Environmental Protection Agency will start auditing all cars for "defeat devices" designed to cheat on emissions tests. The decision was spurred by Volkswagen diesel cars violating clean air laws in this fashion.
Dan Vergano

The U.S. Environmental Protection Agency told all major auto companies on Friday that it would now audit cars for emissions test "defeat devices," following revelations that Volkswagen diesel cars cheated on pollution standards.

The environmental agency announced last week that software in Volkswagen diesel cars – perhaps 11 million vehicles worldwide – was designed to turn off exhaust cleaning controls in engines except when the vehicle underwent emissions tests. With the controls off, the vehicle's exhaust contained up to 40 times more pollutants than allowed by law.

"Today we are putting vehicle makers on notice," EPA's Christopher Grundler said during a news conference. Unlike past emissions test, the details of how the agency, along with Canada's environmental agency, will test vehicles for emissions cheating would not be provided to car makers, he said. That will prevent them from writing software allowing cars to recognize when they are being tested and turn on emissions controls.

In the past, the agency had focused on heavy diesel trucks for such tests because of their significant emissions and history of defeat devices, Grundler said. But now all cars will face added inspection for emissions cheating.

Volkswagen's chief, Martin Winterkorn, resigned in light of the revelations on Wednesday. And claims that BMW cars might have similar emissions questions affected the company's stock on Thursday, leading to a 9.7% drop.

The nonprofit International Council on Clean Transportation (ICCT), which had helped alert EPA to the Volkswagen emissions cheating, said in a statement last week that "defeat devices" are a worldwide problem in cars. European studies, "repeatedly found large and growing gaps between real world emissions and the regulatory certification levels."

"This is a global problem that will require a coordinated global solution," said ICCT's Drew Kodjak.

E.P.A. to Bolster Testing Because of Volkswagen Scandal
By THE NEW YORK TIMES SEPT. 25, 2015

Government regulators said Friday that they planned to step up the testing requirements of cars in the wake of the Volkswagen scandal.

The Environmental Protection Agency, which disclosed last week that it had learned that Volkswagen diesel cars had equipment to evade smog-testing standards, said it had sent a letter to manufacturers of gasoline and diesel cars saying that regulators would be looking for so-called defeat devices in all vehicles.

The agency said Volkswagen had used a device programmed to fool emissions testers into thinking that the car was emitting much less pollution than it was during regular driving.

"Manufacturers should expect that this additional testing may add time to the confirmatory test process," the E.P.A. wrote in its brief letter. The agency said that the new procedures would start immediately and that the California Environmental Protection Agency and Canada's environmental regulators were involved with the stricter requirements.

"We are not going to tell them what these tests are, and they don't need to know," Chris Grundler, director of the agency's office of transportation and air quality, said during a conference call with reporters.

Bloomberg:
http://www.bloomberg.com/news/articles/2015-09-25/u-s-epa-said-to-alter-diesel-emissions-tests-due-to-vw-cheating

U.S. EPA Toughens Emissions Oversight After VW Cheating
Jeff Plungis
September 25, 2015 — 8:42 AM EDT Updated on September 25, 2015 — 10:41 AM EDT

U.S. environmental regulators will add more spot-checks to cars already on the road following Volkswagen AG's admission that it fitted as many as 11 million diesel cars worldwide with software that rigged pollution tests.
"We are upping our game," said Christopher Grundler, director of the Environmental Protection Agency's Office of Transportation and Air Quality.

The U.S. Justice Department is conducting a criminal investigation of Volkswagen, and the company said it's cooperating with regulators. The admission has marred the reputation of the world's largest automaker and sent its shares to the lowest levels in years. Volkswagen's board is expected to name a successor Friday to former Chief Executive Officer Martin

Winterkorn, who resigned this week.
The EPA is sending a letter Friday to automakers informing them that emissions monitoring is being enhanced. Grundler wouldn't say what changes the agency will make to the testing.

"They don't need to know," Grundler, speaking to reporters on a conference call, said of the automakers. "They need to know that we will be keeping their cars a little bit longer." Grundler earlier told the Associated Press that the agency may add on-road testing. It already has on-road testing ability but it's only been used to check carmaker gas mileage estimates and diesel trucks, two situations in which they had uncovered emissions cheating in the past.

Past Cheating
The scandal now engulfing VW, which has admitted to outfitting cars with software designed to give false readings on emission tests, is unique both for the number of vehicles involved, and the digital complexity. But it's not the first emissions-cheating case, even for the Wolfsburg, Germany-based company.

In 1973, the EPA accused the automaker of installing defeat devices in cars it wanted to sell in the 1974 model year. VW then admitted it had sold 1973 model year cars with the devices, which consisted of temperature-sensing switches that cut out pollution controls at low temperatures.
General Motors Co. agreed in 1995 to pay $45 million after being accused of circumventing pollution controls on 470,000 Cadillac luxury sedans. The cars' 4.9-liter V-8 engines were tuned to turn off pollution controls when the air conditioning ran, the EPA said at the time.

The current VW case resembles a 1998 case involving seven manufacturers of heavy-duty truck engines: Caterpillar Inc., Cummins Inc., Detroit Diesel Corp., Mack Trucks Inc., Navistar International Transportation Corp., Renault Vehicules Industriels, S.A. and Volvo Truck Corp.
The companies agreed to spend more than $1 billion, including $83.4 million in penalties, to settle the case -- the biggest civil fine to that point for violating an environmental law.

EPA steps up emissions testing after Volkswagen scandal
By Timothy Cama - 09/25/15 11:22 AM EDT
The Environmental Protection Agency (EPA) is stepping up its emissions testing for diesel cars in an attempt to root out companies that cheat the tests.

The agency, working with officials in California's air pollution agency and Canada, plans to test every model of diesel car on the road to see if other automakers programmed their cars to skirt the tests like Volkswagen Group did.

"We're putting vehicle manufacturers on notice that our testing is now going to include additional evaluation and tests designed to look for potential defeat devices," Chris Grundler, director of the EPA's transportation office, told reporters Friday.
"We aren't going to tell them what these tests are. They don't need to know," he said. "They only need to know we will be keeping their vehicles a little bit longer and we're going to be driving them a little bit more."

The new procedure comes a week after the EPA announced that Volkswagen had programmed many of its diesel cars sold since 2009 to figure out when they were undergoing EPA tests and change their pollution output to comply with the tests.

In real-world driving, the cars emit up to 40 times more nitrogen oxides than allowed under the Clean Air Act.

Officials with the different agencies hope that their tests can find any emissions problems that were not revealed in the testing that all new cars undergo, which is very standardized and does not usually involve on-road driving.

"We must continue to improve and adapt our oversight, and we will," said Janet McCabe, acting head of the EPA's air pollution office.

The emissions issue, to which Volkswagen has admitted, has quickly evolved into an international scandal, with government officials in Europe, Germany, the United Kingdom, France and elsewhere taking action.

Domestically, the Justice Department is conducting a criminal investigation, and a House committee will soon hold a hearing on the scandal.

Volkswagen's chief executive officer resigned this week, and the head of its United States operations is expected to resign as well.

The EPA initially identified less than 500,000 cars with Volkswagen and Audi branding affected. But the company later said the problem extended to 11 million cars worldwide, although the issue only applies to United States emissions standards.

The EPA has 23 devices for testing on-road driving emissions, but Grundler said those have usually been dedicated to heavy-duty truck use.

Grundler and McCabe repeatedly declined to outline the new test procedures, saying they do not want automakers to try to defeat them.

"The smart engineers at EPA, California Air Resources Board and Environment Canada have come up with clever ways to do this," Grundler said.

The announcement does not change the standard testing that applies to new vehicles. Instead, the EPA is using its authority to test cars currently in operation, including those

from rental car fleets and individual consumers.

The new tests started Friday, Grundler said, declining to say how long it would take to test all diesel car models.

EPA to change diesel tests to thwart Volkswagen-like cheating
By Tom Krisher and Matthew Daly - Associated Press - Friday, September 25, 2015

DETROIT (AP) — The U.S. Environmental Protection Agency plans sweeping changes to the way it tests for diesel emissions after getting duped by clandestine software in Volkswagen cars for seven years.

Chris Grundler, head of the EPA's office of transportation and air quality, indicated the agency would add on-road testing to its regimen. VW's sophisticated software allowed its cars to pass tests in the lab and then spew pollution into the atmosphere while on the highway.

The revelations meant unwanted scrutiny for the EPA. Its testing procedures have been criticized for being predictable and outdated, making it relatively easy for VW to cheat. What's more, the EPA did not initially uncover the problem; researchers at West Virginia University did, using on-road testing.

Grundler says the changes are designed to detect software and other methods automakers might use to rig a test.

The EPA and the California Air Resources Board have engineers who are "developing clever ways in which these things can be detected," Grundler says.

He also notes that testing of diesel engines, which make up only 1 percent of the vehicles on U.S. roads, wasn't the top priority for the EPA. The agency did have on-road testing equipment — but it was assigned to monitor automaker gas mileage estimates and heavy-duty diesel trucks, where cheating had been uncovered in the past.

Grundler, who has been with the EPA for more than three decades, says the lack of on-road

testing for diesels "might change in the future." An announcement of the changes could come on Friday.

VW has admitted to installing software on Volkswagen and Audi cars with four-cylinder diesel engines that switches on pollution controls when they are being tested. When the software, called a "defeat device," determines that the cars are back on real roads, the controls are turned off. The EPA says about 500,000 U.S. cars including the Jetta, Golf, Beetle, Passat and Audi A3 have the cheating software, and VW says a total of 11 million cars have it worldwide.

VW was able to fool the EPA because the agency only tested the cars on treadmill-like devices called dynamometers and didn't use portable test equipment on real roads. The software in the cars' engine-control computers checked the speed, steering wheel position, air pressure and other factors to determine when dynamometer tests were under way. It then turned on pollution controls that reduced the output of nitrogen oxide, an ingredient in harmful ozone, the EPA has said.

VW started the scheme with the 2009 model year, and may not have been caught without testing performed at West Virginia University on behalf of the International Council on Clean Transportation, a nonprofit group that advises governments on regulations. EPA and California regulators confronted VW with those findings to VW in May 2014. The automaker eventually did a recall late last year, without much improvement, the EPA says.

Only when the EPA and CARB refused to approve VW's 2016 diesel models for sale did the company admit what it had done.

The EPA announced the violations a week ago and said VW could face billions in fines. The agency said the cars are safe to drive but VW will have to pay to recall and fix them. The agency also is going to test diesels from other manufacturers to make sure they don't have similar devices.

Sen. Bill Nelson of Florida is frustrated that regulatory agencies such as the EPA are failing to protect the public. "Seven years is way too long a time that the EPA has been asleep at the switch," he says.

He says the VW case has similarities to those involving General Motors ' defective ignition switches and Takata Corp.'s exploding air bag inflators, where it also took years before those problems were disclosed to consumers.

"When there is this kind of deception, we've got to get these agencies to be able to cut through it and catch it," Nelson says.
It's not the first time the EPA has had to change testing to make sure automakers are playing by the rules. Earlier this year the agency updated gas mileage tests after some automakers were caught with inflated window sticker estimates.

Grundler disputes the notion that EPA would never have caught VW without the outside

help. European regulators were looking into VW's on-road diesel emissions as far back as 2012, and since diesels make up half the cars there, the EPA decided to let Europe take the lead, he says.

"I don't think it's fair to say that this would never have been uncovered," he says. "Do I wish we had uncovered it sooner? Absolutely."

EPA to road-test cars after Volkswagen emissions scandal
Nathan Bomey, USA TODAY 10:40 a.m. EDT September 25, 2015
The change comes after Volkswagen fooled regulators into believing that its 4-cylinder diesel cars were compliant with emissions rules.

The Environmental Protection Agency told automakers on Friday that it will begin road tests of all new and used vehicle models to examine emissions claims following the exposure of Volkswagen's regulation cheating scandal.

The agency sent a letter to manufacturers notifying them that it will no longer rely exclusively on laboratory testing to validate emissions performance.

EPA also plans to begin testing all diesel models already on the road in the U.S. to check for similar violations.

"EPA may test or require testing on any vehicle at a designated location, using driving cycles and conditions that may reasonably be expected to be encountered in normal operation and use, for the purposes of investigating a potential defeat device," EPA told automakers in the letter.

The agency warned that the new process could mean it will take longer for automakers to secure certification required to sell new vehicles in the U.S.

"We aren't going to tell them what these tests are," said Christopher Grundler, director of the EPA Office of Transportation and Air Quality, in a conference call with reporters. "They don't need to know."

The change comes after Volkswagen fooled regulators into believing that its 4-cylinder diesel cars were compliant with emissions rules by installing sophisticated software to manipulate lab tests.

In reality, 11 million Volkswagen cars worldwide are emitting nitrogen oxides — which can exacerbate respiratory conditions such as asthma — at rates of up to 40 times acceptable U.S. standards.

The scandal has severely damaged Volkswagen's reputation, led to the resignation of the automaker's CEO and called into question the future of diesel cars. Several criminal investigations and numerous lawsuits have also followed.

The automaker set aside more than $7 billion to pay for fixes and fines. The episode is expected to trigger a massive recall.

The Volkswagen scandal has sparked a huge change in car emissions testing
by Benjamin Snyder @WriterSnyder SEPTEMBER 25, 2015, 10:39 AM EDT

Critics have wanted this move for years.

The U.S. Environmental Protection Agency will being testing vehicles' ability to meet emissions standards under real-world driving situations, it announced Friday. The agency formerly conducted random testing of vehicles in a way that critics have argued failed to simulate actual driving.

The change comes less than a week after German automaker Volkswagen admitted that 11 million of its diesel vehicles worldwide were loaded with software designed to trick the emissions testing process. About half a million of those vehicles were sold in the U.S.

EPA may test or require testing on any vehicle at a designated location, using driving cycles and conditions that may reasonably be expected to be encountered in normal operation and use, for the purposes of investigating a potential defeat device," reads a letter the EPA sent to automakers Friday, using an industry term for the illicit software found on Volkswagen's cars.

EPA officials said on a call with reporters Friday that the agency is "actively" testing diesel cars to ensure they meet emissions standards following the Volkswagen's revelations. Environmental agencies in the State of California and Canada are spearheading efforts to ensure there's a "broader and more robust presence" of testing, officials added.

The EPA also said it's working with Volkswagen to determine how to modify the affected vehicles already sold in the American market.

Volkswagen's stock price has tanked amid the scandal, which forced Volkswagen AG CEO Martin Winterkorn to resign Wednesday.

EPA to Overhaul Air-Emissions Testing in Wake of Volkswagen Cheating Revelation
By AMY HARDER
Sept. 25, 2015 9:31 a.m. ET

WASHINGTON—The U.S. Environmental Protection Agency is overhauling the way it polices auto-maker compliance with air-emissions standards after Volkswagen cheated on its testing for seven years, an agency official said Friday.

The EPA is sending a letter to auto manufacturers to explain that it may test or require testing of vehicles in an environment that would resemble normal driving conditions, the official said.

The EPA's current protocol doesn't test under real-word driving conditions, and requires auto makers instead to submit design certificates for compliance. The EPA has conducted random testing, but those are done in a controlled environment. Volkswagen had installed software designed to evade those tests.

Since at least 2008, Volkswagen has been using software, dubbed defeat devices, in several light-duty diesel models around the world—nearly a half-million cars in the U.S. and as many as 11 million world-wide—that disabled air-emissions controls under normal driving conditions.

The EPA's announcement Friday caps a tumultuous week for Volkswagen, whose CEO resigned following the revelations, and for the U.S. government, which scrambled to respond to the German auto maker's cheating.

The Justice Department is pursuing a criminal investigation.

"We have to be concerned about whether or not there are other defeat devices out there that we have not been able to detect," EPA Administrator Gina McCarthy said at an event hosted by The Wall Street Journal this week. "This was particularly difficult for us to detect. We got there."

It wasn't immediately clear Friday how comprehensive the new testing in normal driving conditions would be. Some experts have been calling on the agency to conduct such testing.

"The most important change that could take place is if EPA started incorporating real-world testing throughout their compliance process," said Drew Kodjak, executive director of the

International Council on Clean Transportation, a nonprofit research organization. The organization, alongside West Virginia University researchers, uncovered the testing anomalies in two Volkswagen model cars in 2014.

"The agency certainly has the authority to do this type of thing, but typically doesn't do them because, frankly, they're quite expensive," Mr. Kodjak said on Thursday.

In 2014, Mr. Kodjak's group and the university researchers conducted emissions testing, including under normal-driving conditions, that found two Volkswagen cars—a 2012 Jetta and 2013 Passat—had significantly higher nitrogen oxide emissions during normal driving conditions than what was certified with the EPA. Another car the researchers tested, a diesel-powered BMW, didn't have higher nitrogen oxide emissions.

EPA to change diesel tests to prevent VW-like cheating
by Chris Matthews @crobmatthews SEPTEMBER 25, 2015, 7:50 AM EDT

Diesel 'wasn't the top priority for the EPA.'

The U.S. Environmental Protection Agency is planning wholesale reform of its procedure for testing diesel engines, following revelations that Volkswagen VLKPY -5.72% installed software in its cars that allowed it to fool regulators into thinking the vehicles were cleaner than they actually were, according to the Associated Press.

Chris Grundler, head of the EPA's office of transportation and air quality, told the news service that his agency would begin testing cars on the road in addition to the tests performed with cars on treadmills.

Grundler told the AP that cars with diesel engines, which make up only 1% of the vehicles on U.S. roads, "wasn't the top priority for the EPA."

"The agency did have on-road testing equipment — but it was assigned to monitor automaker gas mileage estimates and heavy-duty diesel trucks, where cheating had been uncovered in the past," the report said.

The EPA's testing procedures have been criticized for being predictable and outdated, the AP said, potentially making it easier forVW to cheat. And it was researchers at West Virginia University—not the EPA—that uncovered the problem using on-road testing, the AP added. An announcement of the changes could come on Friday.

Volkswagen board gathers to appoint replacement for Winterkorn
Chris Bryant in Frankfurt and Barney Jopson in Washington

Volkswagen's board are gathering to appoint a new chief executive to lead the troubled carmaker out of the worst scandal in its history, with Matthias Müller, head of Porsche, as the favourite candidate.
The supervisory board meeting at VW's Wolfsburg headquarters — which may take several hours — follows Martin Winterkorn's resignation after eight years at the helm of the group.

People close to VW indicated that Mr Müller is the frontrunner in the succession race.
He is close to the Porsche and Piech families, who together control a majority of VW's voting shares, knows Volkswagen inside out and has a reputation for speaking his mind.
The company declined to comment.

The board is also expected to decide on Friday which managers must leave the company over the scandal, with attention focusing on high-level engineers and designers.

VW has been reeling since the US Environmental Protection Agency revealed last Friday that the group had rigged its diesel cars to pass emissions tests, potentially laying itself open to criminal charges and substantial fines.

The EPA said that VW had installed "defeat device" software that activated technology designed to reduce emissions from the vehicles only when it detected that they were being tested. The emissions then returned to much higher levels during regular driving.

The EPA said 482,000 vehicles sold in the US since 2008 were affected, but VW later raised that figure to 11m worldwide. It said it would take a €6.5bn charge to cover the costs of the crisis.

A senior official at the EPA told the Financial Times that Volkswagen had orchestrated an unprecedented effort to beat the EPA's rigorous testing regime. "The level of deceit the company went through to game the system was enormous," the official said.

The EPA operated a cutting-edge testing regime to police compliance with clean air regulations, the official said, and it took an "elaborate, aggressive, ongoing, co-ordinated effort" to beat it. "We've seen uses of defeat devices, but nothing to this scale," the official said.

INSIGHT-After year of stonewalling, VW stunned US regulators with confession
WASHINGTON/DETROIT SEPT 24 | BY TIMOTHY GARDNER, PAUL LIENERT AND DAVID MORGAN

The confession of cheating that's embroiled Volkswagen AG in one of the biggest scandals in auto industry history came on a cool California morning, on the sidelines of an academic conference focused on green transportation.

After more than a year of stonewalling investigators, Volkswagen stunned two senior officials with the U.S. Environmental Protective Agency and California's environmental watchdog by admitting the automaker hacked its own cars to deceive U.S. regulators about how much their diesel engines pollute.

That disclosure on Aug. 21, confirmed by two people with knowledge of the exchange, shows Volkswagen buckled to pressure from environmental regulators almost a month earlier than the scandal was made public. The admission to regulators came after a year during which VW officials insisted to regulators that tests on its diesel cars showing a spike in pollution levels on the road were in error.

U.S. officials exposed the deception on Sept. 18, triggering Volkswagen's admission that it had installed software in its cars to detect when they were being tested and alter settings to conceal the true emissions of 11 million cars sold worldwide. The delay between VW's confession and the U.S. exposure of the scandal occurred as regulators prepared their response to the disclosure.

As a result, Volkswagen, the world's largest automaker by sales, faces EPA fines that could reach $18 billion, class action and other lawsuits that could add billions of dollars more in liability and a U.S. criminal investigation. VW's leadership is in turmoil after chairman Martin Winterkorn was forced to resign and sources said other executives including the head of U.S operations were soon to follow.

Now, the story of how investigators unraveled systemic cheating in the face of consistent denials from the company may have implications for the sanctions VW will face and for an auto industry certain to face more scrutiny about its environmental claims. The company's lack of cooperation could figure into punitive action by the government.

At first, regulators were surprised that Volkswagen would make its confession at the conference, held in Pacific Grove, California. Minutes before Christopher Grundler, director of the EPA's transportation and air quality office, was to deliver a 9 a.m. speech to the conference, a Volkswagen representative told him about the deception. At the same

meeting, representatives of the California Air Resources Board, a state agency that had been pushing VW hard, were also given a verbal notice of the deception, people with knowledge of the events said.

Volkswagen declined to comment on the sequence of events described to Reuters. It isn't clear who the VW representative was who delivered the news of the deception to Grundler and the CARB. Stuart Johnson, head of VW's engineering and environmental office in the United States, was registered to attend the Aug. 21 conference, which was organized by the University of California, Davis. Johnson, who still works for VW in Auburn Hills, Michigan, did not respond immediately to a request for comment.

Norbert Krause, who was head of VW's U.S. environmental office until 2009 and who retired from VW in 2011, said nobody at Volkswagen of America was involved in the process of engineering the diesel cars.

"I don't know anything about the modification of the software," Krause said when reached by telephone in Germany. "The software was okay when we certified the vehicle and we made our durability runs. Everything was fine."

DECEPTION ACKNOWLEDGED

A formal acknowledgement of the deception came on Sept. 3, when the EPA and California officials held a conference call with Volkswagen executives in Germany and the U.S. During the call, the automaker went over written details provided to the participants explaining how software used in its diesel cars was able to manipulate emissions tests in the United States.

That admission came after the EPA threatened to withhold approval for the company's 2016 Volkswagen and Audi diesel models, according to a letter sent by the EPA to Johnson and VW's attorney. The letter detailed some of the timetable of the EPA's actions.

So ended 15 months of back-and-forth between Volkswagen and U.S. and California regulators who had come to suspect that the diesel engines were producing higher nitrogen oxide emissions during normal driving conditions than what was certified by the EPA and California, people involved said. Nitrogen oxide emissions have been linked to smog and acid rain.

Volkswagen had heavily marketed what it called "clean diesel" engines starting in 2008 with the 2009-model Jetta TDI. It appeared to have found a sweet spot between high-performance and fuel-efficiency with a zippy, fun-to-drive car that topped 40 miles per gallon in highway driving. Named "Green Car of the Year" at the Los Angeles auto show in 2008, the Jetta TDI was seen as a breakthrough in a country where diesel passenger cars occupy a tiny niche compared with Europe, where they are about half of the market.

GRANDFATHER'S DIESEL

"It's not your grandfather's diesel," Krause said in a September 2008 presentation to U.S. regulators, according to a video of the remarks.

Krause and other VW officials promised a diesel that would meet pollution laws in all states, including California where diesel engines had long been associated with smog and cancer-causing soot.

By that point, VW and other automakers had lobbied for almost a decade for regulators to give diesel another chance. In 2000, VW and other companies with an interest in promoting diesel, including Mazda, formed the Diesel Technology Forum to lobby for increased use in the United States as a way to reduce reliance on imported oil. In 2005, an energy bill signed by President George W. Bush offered tax credits for diesel buyers. That gave the first wave of diesel Jetta buyers an income tax credit of $1,300 each.

In 2009, after the new Jetta went on sale, VW dealers initially sold out, including in California where regulations had effectively shut the market to diesels earlier in the decade.

Around the same time, in Europe, regulators were skeptical. A European Commission study concluded in 2013 that European car makers were exploiting test loopholes. Separate findings by the EC's Joint Research Centre showed a discrepancy between test results and real world performance in European diesel engines.

California began its inquiry after EC regulators sought to obtain American data on the on-road emissions performance of diesel engines, said Stanley Young, CARB's communications director. The Europeans had a working theory that diesels should run more cleanly in the United States, where regulations are stricter, than in Europe.

To produce that data, they commissioned the U.S.-based nonprofit International Council on Clean Transportation in February 2013, which hired researchers at a West Virginia University lab.

The WVU researchers placed emission-monitoring equipment on a rented 2012 Jetta and a 2013 Passat. Over seven weeks in spring 2013, they drove the cars around Los Angeles and up the West Coast to Seattle, comparing them to a BMW X5 sport-utility with a diesel engine, said Daniel Carder, who led the WVU team. While the BMW's emission results came in under what the vehicles produced in laboratory tests, those of the Jetta were 15 to 35 times higher than the legal limit and the Passat 10 to 20 times higher.

Soon after, the same rental cars tested by WVU were monitored in CARB's El Monte, California, test facility east of Los Angeles. There were no irregular emissions.

Over the next 12 months, the West Virginia University researchers analyzed the data. They presented their findings at a March 31, 2014, conference in San Diego partly sponsored by California regulators and the EPA.

EXECUTIVES ON ALERT

"That data put our executives on alert that there was clearly a problem for the U.S. and California," said Young, the CARB official.

At meetings between California officials and Volkswagen that began in the summer of 2014, engineers from the German carmaker tried to "discredit the findings" by challenging the data and methodology of the study, Young said. "They were recalcitrant," he said. "It was a range of issues. Every time it was something different."

Among other things, VW said that "our calibration was off" and that the discrepancies had to do with "the conditions under which the test was done," Young said.

On Dec. 2, Volkswagen shared the results of its own tests, blaming its increased emissions on "various technical issues and unexpected in-use conditions," according to the EPA. Then Volkswagen agreed to recall vehicles to fix their engine-control software.

Engineers at CARB kept testing and found the proposed software fix did not significantly reduce emissions. A break came when they looked at diagnostic data stored in the cars' own computer system.

"We discovered some very strange anomalies," Young said. "For instance, the car was running more cleanly when it was cold than when it was warm, which is the opposite of what every other car does - because once you warm a car up that's when it begins to deliver its best pollution controls. This was not the case. So clearly something else was going on. Over time we assembled enough proof and questions that they could no longer provide any reasonable explanation for what was going on."

On July 8, CARB shared its results with VW, but there was no change in Volkswagen's position. Some officials privately questioned whether Volkswagen was deliberately violating the federal Clean Air Act by installing defeat devices -- software programmed to switch engines to a cleaner mode during official emissions testing, according to a person involved in the process.

During normal driving, the software then shuts off, enabling cars to emit as much as 40 times the legal limit of pollutants.

In early August, Oliver Schmidt, who followed Krause and preceded Johnson in VW's U.S. engineering and environmental office, attended a conference in Traverse City, Michigan and told regulators Volkswagen stood by its conclusions that the problem was technical, said people involved said. Schmidt declined to speak to Reuters.

"I'm just amazed," said Alan Lloyd, who headed CARB from 1999 to 2004 and helped open California's market to diesels. "Why someone would think they could cheat in this way and get away with it is beyond me."

AP (via ABC News):

Will Volkswagen Scandal Tarnish 'Made in Germany' Image?
By DAVID RISING, ASSOCIATED PRESS
BERLIN — Sep 24, 2015, 4:54 PM ET

The "Made in Germany" label has stood for precision and reliability for decades, but since Volkswagen admitted to cheating on U.S. car emissions tests, many are questioning whether the automaker's problems could taint the rest of the country.

It's the second serious blow to a major German company's reputation in six months, following the tragic crash of a Germanwings jet that killed 150 people. Parent company Lufthansa has faced questions over why it failed to identify the psychological issues suffered by the pilot who intentionally flew the plane into a French mountain.

Will such crises tarnish the hard-won, valuable reputations for quality of other German brands, such as BMW, Daimler or Bosch?

Experts say VW's problems could hurt the economy in the short term due to the company's sheer size, but that long-term damage to the country is unlikely.

That doesn't mean others won't try to capitalize. Companies will try to grab market share. And across Europe, people in countries that have been lectured by Germany for years about the virtues of financial honesty could be feeling smug.

"Not only does this make Germany look bad, I think that Germany has been very good at moralizing to the rest of Europe about the financial crisis and other things," said Michael Hewson, chief market analyst for CMC Markets in London.

"Germans have a word for it — 'schadenfreude' — and Germany's getting a big dose of it now," he said, referring to the German word for taking pleasure at the misfortune of others.

Indeed, Internet memes of VWs covered in clouds of smog were already making the rounds, and media commentators were quick to pounce on the issue.

"In Europe, there is a strong dose of schadenfreude ... after the Germans, and primarily Chancellor Angela Merkel, have for years been giving lectures others," wrote Thilo Schaefer for Spain's La Marea news magazine.

Still, in Lufthansa's case, the airline has not appeared to suffer any serious damage following the March crash.

Volkswagen's case could prove more costly for the company, though by how much is still unclear. CEO Martin Winterkorn resigned Wednesday and the company is expected to

name a replacement Friday.

The EPA accused VW of installing the so-called "defeat device" in 482,000 cars sold in the U.S. VW later acknowledged that similar software exists in 11 million diesel cars worldwide and set aside 6.5 billion euros ($7.3 billion) to cover the costs of the scandal.

It still faces possible criminal investigations and maybe as much as $18 billion in U.S. fines. The final cost could also depend on a host of class action lawsuits being filed by consumers who feel duped.

This is by no means the first time in recent years that a major German company's reputation for probity has taken a huge knock — though perhaps the first time that the damage has stemmed directly from a product that was popular with consumers.

Volkswagen itself was at the center of an unappetizing scandal less than a decade ago — before Winterkorn took over — that resulted in criminal convictions for the company's then-personnel chief and employee council chief, among others. That case centered on allegations that VW's influential employee representatives received illegal privileges, including lavish foreign trips involving prostitutes paid for by the company. The probe started after Volkswagen alerted prosecutors to possible wrongdoing.

Industrial conglomerate Siemens AG acknowledged dubious payments of up to 1.3 billion euros in a bribery case that came to light in 2007 and prompted the departure of the company's then-CEO and board chairman.

The company's biggest bank, Deutsche Bank, has also struggled to put behind it lawsuits and legal issues that in some cases date back years.

In April, Deutsche Bank agreed to pay $2.5 billion to authorities in the U.S. and Britain to settle allegations its traders rigged important market interest-rate benchmarks used to determine rates on a variety of debt.

Hartmut Dziemballa, who conducts image research for Germany's GfK institute with a focus on the automotive and airline sectors, said past scandals have not had lingering effects and that he didn't expect the Volkswagen scandal would significantly affect other German manufacturers — even car companies.

"The quality and the German engineering is still there, and people know that," he said.

Still, if a scandal with any brand has the potential to smear the whole "Made in Germany" label, it's Volkswagen, which is deeply interconnected with the country's people and politics.

Germany is the world's third largest exporter, vehicles are its largest export, and Volkswagen is its largest automaker. It employs over half a million people globally.

It's the largest single employer in its home state of Lower Saxony, which owns 20 percent of the company and whose governor and economy minister sit on its board of directors. VW's former personnel director Peter Hartz was also an adviser of former Chancellor Gerhard Schroeder, and today's welfare system is still called "Hartz IV" after his reforms.

Carsten Brzeski, an analyst with ING in Frankfurt, said while "the reputational damage is currently impossible to assess," because of its size even if the main impact of the scandal is limited to Volkswagen it could have serious economic effects on the German economy overall.

"While the German economy defied Greece, the euro crisis and the Chinese slowdown, it could now be facing the biggest downside risk in a long while," he said in a research note.

Analysts say there is the possibility that the fallout from the scandal might affect other car companies, whether through the need for tougher regulation or a shift away from the diesel engines at the center of the U.S. scandal.

Vice Chancellor Sigmar Gabriel told reporters at the auto show in Frankfurt after the news broke that the VW scandal would mean nothing to the "Made in Germany" label — before adding "I hope."

Dealers, owners frustrated over VW scandal
Associated Press 3:21 p.m. EDT September 24, 2015

LOS ANGELES — Bob Rand bought his Volkswagen Passat last year for its clean emissions and high gas mileage. He liked the car so much he convinced his son and a friend to buy one, too.

Now, as Volkswagen comes clean about rigging diesel emissions to pass U.S. tests, Rand is desperately trying to sell the fully loaded model with white leather seats for $10,000 below what he paid. His sole bite has been from a man who offered $7,500 on speculation that he could resell it in Mexico.

“Volkswagen was somebody that you could rely on for cutting-edge products and quality and all those things and now you find out that they’re not above lying just flat out,” said

Rand, who plans to join a class-action lawsuit against VW. "That's probably about as bad a thing as a company can do is lie to your face when you're buying a $35,000 car."

Rand's anger at the world's top-selling car company was echoed Wednesday by private dealers, auto wholesalers and owners across the U.S. as fallout from the smog test trickery mounted.

The EPA first disclosed Friday that stealth software makes VW's 2009-2015 model cars powered by 2.0-liter diesel engines run cleaner during emissions tests than in actual driving. On Wednesday, Volkswagen CEO Martin Winterkorn resigned and took responsibility for the "irregularities" found by U.S. inspectors — a scandal that has wiped out billions in the company's market value and raised the possibility of criminal investigations and billions more in fines.

The revelations left dealers sitting on hundreds of diesel cars they could not sell. Many also dealt with a flood of angry calls, emails and tweets from Volkswagen owners who felt betrayed because they believed they had bought a car that polluted less without sacrificing the good gas mileage and performance that comes with a diesel engine.

"I think their feet should be held to the fire. I think apologies don't mean anything when something is so premeditated," said Joe DeCarolis, of Cary, North Carolina, who owns a 2012 TDI Jetta Sport Wagon — a car he bought after careful comparison shopping for its clean emissions and good gas mileage.

Jon Vitale of Fowlerville, Michigan, listed his 2012 Volkswagen Passat for sale on the Internet last month, barely getting any interested callers.

But after finding out about the scandal, he's thinking the news might actually make it easier to sell his car.

"I don't know if the news will help me or hurt me," said Vitale, who bought the car used two years ago for its gas mileage. "I didn't get much interest before the news came out. If someone wants it, maybe they'll pay more because there's a stop sale on the new models."

Dealers can't give customers good answers because Volkswagen hasn't said a whole lot, said AutoNation CEO Mike Jackson, the leader of the largest auto dealership chain in the U.S.

AutoNation's six Volkswagen and eight Audi dealerships in the U.S. are telling customers that the cars are safe to drive and promising to call them as soon as they know more about repairs. "That's not adequate," Jackson said. "We need answers by next week."

A lot of people within VW had to know about the software that turned emissions controls on during government tests and off for regular driving, especially because the scheme went on for multiple years, Jackson said.

"This tells me that it's not a bad apple. It's not a rogue employee. It's deliberate deception," Jackson said. "It's a systemic failure. This took a lot of meetings. This took a lot of engineers. This took a lot of software programmers to put in place and keep in place."

Meanwhile, concern was growing at private dealerships about what to do with inventory that's now gathering dust.

At Volkswagen of Oakland, California, nearly two dozen new diesel cars have no chance of being sold in the short-term, while 25 2016 model vehicles are being held up at the Port of San Diego because they can't pass emissions standards, sales manager Chris Murphy said. Customers have been calling and emailing to demand the dealership buy their cars back or offer refunds.

"We can't afford to buy all those cars back. We're just one dealer," he said, adding that diesel models make up about 30 percent of the business. "This is definitely going to impact our business. We're trying to focus on positive, not negative things because there's nothing we can do."

Williams Volkswagen in Lansing declined to comment on how the company's actions affected its sales. It's the only Volkswagen dealer in the region.

Vitale thinks used models may become more valuable to some people who aren't as environmentally conscious, particularly because Michigan doesn't require emissions testing.

"I got a call a few days ago and the guy asked me about the news, and despite all that, he still wanted it," said Vitale, who is selling the car because he no longer needs it. "It's not illegal to drive in Michigan because there's no emissions testing here."

Volkswagen has taken steps to help out the dealership, Murphy said. That includes guaranteeing reimbursement for sales objectives for two quarters whether or not the goals are met and waiving the interest the local franchise normally pays on unsold cars on their sales floor, he said.

"They're making all the right steps. … I'm just waiting for everything to get uncovered to see how deep this really goes. I'm not mad at anyone except the people higher up who made these decisions," Murphy said.

Lash Volkswagen of White Plains, N.Y., has been scrambling to accommodate affected Volkswagen owners by giving them loaner cars and picking up or dropping off their cars when it's time for repair, said Tom Backer, general manager of the dealership in New York's Westchester County.

Dealers, he said, were told that there will be both software and hardware changes to fix the problem. They're already on 2016 models and are awaiting approval from the Environmental Protection Agency, Backer said. Older models will get the same fixes, he

said.

But not every Volkswagen dealer is fielding calls from angry customers.

Bill Haggerty, a sales manager at a VW dealership in the Chicago suburb of Oak Lawn, Illinois, said he hasn't heard concerns from customers so far. Diesels make up less than 20 percent of his business and draw the most interest from customers looking for better gas mileage, he said.

"We have 200 Volkswagens in stock; three of them are Jetta diesels," he said. "So, it's not like every Volkswagen out there has got a diesel motor in it. They sell an awful lot of cars with good gas mileage and great safety records."

Volkswagen Diesel Scandal: Is The EPA Partly To Blame?
By Cole Stangler @colestangler c.stangler@ibtimes.com<mailto:c.stangler@ibtimes.com>
on September 24 2015 2:10 PM EDT

Are emissions tests too easy? A Volkswagen car is pictured at a technical and testing center in Zenica, Bosnia and Herzegovina, Sept. 23, 2015. Reuters/Dado Ruvic
Since Volkswagen admitted this week to cheating on pollution tests for years, there has been a flood of outrage. Overwhelmingly, it is directed at the most obvious culprit: the German automaker, which admitted to equipping 11 million of its diesel cars worldwide with software specifically designed to reduce emissions during tests. But some critics argue Volkswagen is not the only one to blame. Are the regulators at fault, too?

"Automakers have been able to exploit lax testing systems in the U.S. and Europe," declared a Bloomberg editorial this week. "Regulators owe it to both car buyers and the environment to make these systems more rigorous."

In the United States, critics say, the Environmental Protection Agency isn't as strong a watchdog as it should be. The editorial board at Bloomberg says the EPA gives automakers like Volkswagen too much latitude in determining testing conditions. The agency doesn't have engineers on hand at the labs that actually conduct the exams, doesn't vary its testing routines enough and should have done more to detect the sneaky software gambit that will likely lead to the recall of some 500,000 cars in the U.S.

The EPA did not respond to requests for comment.

Volkswagen's deception may be particularly widespread and therefore more egregious. But it's not the first company to cheat American emissions standards. Hyundai and Kia acknowledged they overstated fuel economy standards on 1.2 million cars from 2010 to 2012. Last November, the companies agreed to a combined $300 million settlement with

the Justice Department and the EPA for doing so.

Still, Tyson Slocum, director of the energy program at consumer advocacy group Public Citizen, said it's unfair "to claim the EPA is responsible for a very sophisticated deception."

Emissions tests in the United States consist of the following: Automakers put their cars on rollers at various testing sites and run them through a set of federally approved maneuvers. Volkswagen duped the system by writing code into its diesel cars' software that automatically switched them into a sort of "low-emissions mode" during these moves.

Even with a beefed-up team of monitors on hand at testing sites, Slocum said, Volkswagen's trick "would have been very hard to catch." "Stopping a determined criminal is tough," he said, and "at the end of the day, you've got to hold the primary entity accountable."

At the same time, Slocum said, those complaining about the agency's oversight methods or regulatory capabilities should turn to federal legislators.

"Congress is to blame for the EPA's light touch," he said. He scoffed at the "Chicken Little" attacks from federal lawmakers and industry alike that frequently deride the agency as a jobs killer. Since 2010, the agency has seen its budget decline by 20 percent, or about $2 billion. (Earlier this month, before the emissions scandal broke, 20 members of Congress filed articles of impeachment against Gina McCarthy, head of the EPA.)

Europe's testing system, on the other hand, is widely seen as more hands-off than the United States'. Automakers there comply with the New European Driving Cycle, a test that got its last major revision in the 1990s. It takes less time to complete than its American counterpart and doesn't properly simulate real-world conditions, critics contend, and therefore is easier to game. A recent report from the U.K. Committee on Climate Change found the gap between official and real-world emissions of new passenger cars rose from 10 to 35 percent between 2002 and 2014.

Officials from the European Environment Agency did not respond to requests for comment.

Bill Becker is the executive director of the National Association of Clean Air Agencies, a group that represents state and local pollution control agencies. He said "the EPA certainly has a role but they don't deserve a severe whipping about what happened."

Those concerned with preventing similar conspiracies in the future should look toward the judicial system, which has the ability to set a strong deterrent effect, he said. Penalties wield far more influence over automaker behavior than any changes to emissions testing procedures.

"The solution here is for the courts and the Justice Department to impose as severe a penalty as possible," he said, "to penalize so harshly that no other employer would ever consider this again."

Germany: VW cars with suspect software in Europe too
By Geir Moulson | AP September 24 at 12:19 PM

BERLIN — The software at the center of Volkswagen's emissions scandal in the U.S. was built into the automaker's cars in Europe as well, Germany said Thursday, though it isn't yet clear if it helped cheat tests as it did in the U.S.

A day after longtime CEO Martin Winterkorn resigned over the scandal, a member of Volkswagen's supervisory board said he expects more executives to step down. The company's supervisory board meets Friday and could announce new resignations then as well as a new CEO.

The U.S. Environmental Protection Agency disclosed Friday that stealth software makes VW's 2009-2015 model cars powered by 2.0-liter diesel engines run cleaner during emissions tests than in actual driving.

The EPA accused VW of installing the so-called "defeat device" in 482,000 cars sold in the United States. VW later acknowledged that similar software exists in 11 million diesel cars worldwide and set aside 6.5 billion euros ($7.2 billion) to cover the costs of the scandal.

The company has told officials that the vehicles in question included VW cars with 1.6-liter and 2-liter diesel engines in Europe, German Transport Minister Alexander Dobrindt said Thursday.

"We don't yet have figures for how many of these 11 million cars that are apparently affected are in Europe," Dobrindt said. "That will be cleared up in the next few days."

Authorities will continue working with Volkswagen to determine what cars exactly are involved.

It isn't yet clear to what extent the scandal affects other brands in the Volkswagen Group, which has 12 brands in all — including Seat, Audi, Skoda and Porsche. It was also not clear whether the software would have led to VW cheating on emissions tests outside the U.S. as

well.

Dobrindt this week set up a commission of inquiry to look into the scandal. The motor transport authority is conducting static and road tests on Volkswagen models and spot tests on cars made by other manufacturers, German and foreign.

In neighboring France, Environment Minister Segolene Royal on Thursday announced random tests of about 100 French cars to ensure that their engines meet pollution standards in the wake of Volkswagen's emissions scandal.

And the European Union's executive Commission called on national authorities "to look into the implications for vehicles sold in Europe and ensure that EU pollutant emission standards are scrupulously respected."

Olaf Lies, economy and transport minister of VW's home state Lower Saxony, which holds a 20 percent stake in the company, said the investigation into the scandal was only just starting.

"There must be people responsible for allowing the manipulation of emission levels to happen," he told rbb-Inforadio.

Winterkorn said Wednesday he took responsibility for the "irregularities" found by U.S. inspectors in VW's diesel engines, but insisted he had personally done nothing wrong.

VW is filing a criminal complaint with German prosecutors, seeking to identify those responsible for any illegal actions in connection with the scandal.

Other auto companies have seen their shares drop, too, though there have been no allegations they cheated emissions tests.

On Thursday, shares in BMW dropped 5.2 percent to close at 75.68 euros after Germany's Auto Bild magazine reported that road tests by the International Council on Clean Transportation showed the BMW X3 xdrive model exceeding European emissions limits by more than 11 times. It did not say what the cause for the alleged problem was.

BMW said in a statement that it was not familiar with the test and would ask the ICCT for clarification. It said that "the BMW Group does not manipulate or rig any emissions tests."

Exclusive - VW recall letters in April warned of an emissions glitch
SAN FRANCISCO | BY ALEXANDRIA SAGE

In April of 2015, Volkswagen of America, Inc.(VOWG_p.DE) sent letters to California owners of diesel-powered Audis and Volkswagens informing them of an “emissions service action” affecting the vehicles.

Owners were told they would need to take their cars to a dealer for new software to ensure tailpipe emissions were "optimised and operating efficiently."

The company didn’t explain that it was taking the action in hopes of satisfying government regulators, who were growing increasingly sceptical about the reason for discrepancies between laboratory emissions test results and real world pollution from Volkswagen’s diesel cars.

Officials at the California Air Resources Board and the EPA agreed in December of 2014 to allow a voluntary recall of the company’s diesel cars to fix what Volkswagen insisted was a technical – and easily solved - glitch. The recall was rolled out nationally over a period of months.

On Wednesday, California Air Resources Board spokesman Dave Clegern confirmed that the letters were part of that recall. “This is one of the fixes they presented to us as a potential solution. It didn’t work,” he said.

Volkswagen, which had no obligation at the time it initiated the recall to disclose the discussions that had led to it, declined to comment on the letter.

The controversy came to public attention last week after Volkswagen acknowledged it had deliberately deceived officials about how much its diesel cars polluted.

The recall letter instructed owners of certain 2010-2014 Volkswagen vehicles with 2-liter diesel engines to contact dealers for a software update in order to fix an issue with the malfunction indicator light illuminating.

“If the [light] illuminates for any reason, your vehicle will not pass an IM emissions inspection in some regions,” the letter warned, noting that California required the update before it would renew vehicle registrations.

"The vehicle's engine management software has been improved to assure your vehicle's tailpipe emissions are optimised and operating efficiently," read the letter, which said an earlier software update increased the likelihood of the light illuminating.

It is customary for carmakers to perform updates to their cars through dealerships to fix or update software.

Volkswagen has said that 11 million of its cars around the world could be affected in the scandal that broke last week. The German company has set aside 6.5 billion euros ($7.3 billion) in its third-quarter accounts to help cover the costs of any fallout.

The U.S. Justice Department has launched a criminal probe and at least 25 proposed class actions on behalf of consumers have already been filed in seven states.

WSJ:
http://www.wsj.com/articles/vws-customers-feel-confusion-remorse-1443051169

VW's Customers Feel Confusion, Remorse
Auto owners worry how emissions scandal will affect vehicles' performance, resale value and compliance with clean-air standards
By CHRISTINA ROGERS in Detroit and ERIC SYLVERS in Milan

Deborah Scott went shopping for a new car in 2010 and came back home with a diesel station wagon made by Volkswagen AG. Fuel efficiency, low emissions and a peppy engine won her heart.

Now, she finds herself suffering from a case of buyer's remorse. "I feel very confused," said the 61-year-old retired nurse practitioner from Chattanooga, Tenn.

Less than a week ago, the Environmental Protection Agency said the German maker of her car lied about its diesel-emissions performance and is demanding a fix on nearly 500,000 affected vehicles on U.S. roads. That leaves owners, such as Ms. Scott, wondering how that will affect performance, resale value and compliance with clean-air standards.

"I feel like I'm eventually not going to have the car that I initially agreed to buy," said Eric Schoenecker, a Minnesota owner of a 2013 diesel Jetta. A recent visit to Craigslist.com indicated resale value on cars like his have fallen 20% since the emissions scandal emerged. The EPA says affected Volkswagens emit nitrogen oxides at up to 40 times the standard.

Volkswagen's emissions headache has gone global, with the auto maker now saying 10.5 million additional vehicles could be affected outside the U.S. On Wednesday, the company's chief executive resigned amid a sharp decline in market value and many investigations initiated in various countries.

Buyers, however, are primarily interested in answers that aren't immediately forthcoming.

"All we've received so far are talking points from VW emphasizing that we tell customers this is not a safety issue," Mike Jackson, chief executive of No. 1 car dealer chain AutoNation Inc., said. "They tell us they will get back to us on how they will bring cars into compliance."

Volkswagen representatives said the company is investigating the matter and will be in touch with dealers and buyers as soon as possible.

Dealers say traffic in Volkswagen showrooms is drying up in the U.S., deepening the pressure the auto maker has experienced in recent years as market share has fallen. "As this

story matures, we expect it to have more of an impact on sales," said one dealer, choosing to remain anonymous.

Volkswagen has 650 dealers in the U.S., and sold 238,000 vehicles through August—a 2.8% decline from the same period in 2014 and far below other major auto makers selling cars in America. About 20% of those deliveries are diesel.

At some point, those dealers will need to employ a fix, according to EPA guidelines. Volkswagen, setting aside $7 billion for the crisis, will have to pay for repairs. Meanwhile, cars are likely to pass emissions standards because they are fitted with a device that enables cheating on emissions tests, the EPA said.

Anna Stefanopoulou, a mechanical-engineering professor and engine expert at the University of Michigan, said a permanent fix could be as simple as downloading new software for the car. Or, Volkswagen could be looking at a cost of $2,000 a vehicle if new hardware needs to be installed.

Fuel economy, rated at more than 40 miles a gallon for some diesel models sold by VW, will take a hit. Consumption could rise 5% to 7% at high speeds or other driving conditions because components needed to clean emissions can dent engine performance.

Some doubt the solution will be simple.

"A software fix in the U.S. seems very unlikely because the emissions are so much higher than is allowed," Paolo Martino, a Frost & Sullivan consultant, said. Any adjustment would probably so radically "change the performance of the cars that consumers would no longer want to own them.

Wired:
http://www.wired.com/2015/09/vw-going-pay-smog-scandal-much/

Eric Niiler

VOLKSWAGEN ISN'T GOING to get away with this. You don't (allegedly!) fake emissions data for a few million cars and just walk away. But what the German automaker's punishment will be, and how much it's going to hurt—those are still open questions.

The final decision will be up to lawyers at the US Environmental Protection Agency and Department of Justice. That latter agency has opened a criminal probe into the company's (alleged!) emissions software tampering shenanigans. But based on precedent and the outlines of what Volkswagen actually seems to have done, we can make a few predictions.

If US officials absolutely throw the book at VW, EPA rules stipulate a maximum fine of $37,000 per affected car. At 482,000 cars on American roads, that comes to $18 billion. But according to attorneys who work on these kind of cases, that number is way too high for

what'll actually happen. The biggest fine of this kind to date was $1.2 billion, a criminal penalty that Toyota paid in 2014 for concealing information about faulty ignition switches that triggered sudden accelerations.

But that was for a mechanical breakdown. For a closer analogy we could look back to 1998, when seven truck manufacturers including Caterpillar and Mack together paid $1 billion for installing defeat devices—sounds familiar—in tractor trailer and pickup trucks. A year before, Ford paid a relatively paltry $7.8 million to settle allegations the company violated the Clean Air Act by yes, installing defeat devices—this time in Econoline vans. But the company also paid $2.5 million in emissions offsets and $1 million to study new technology that fought emissions. So it's possible VW might have to pony up for regulatory violations as well as smog offsets for what they actually emitted.

As a matter of process, regulators will want a fine that's big enough to work not only as punishment for VW but as a deterrent to anyone else who might think about trying something similar. It can't just be the cost of doing business. "There aren't a lot of examples of this kind of conduct," said one private attorney who has handled pollution settlements between major companies and the government. "There are a fair number for failure to disclose, or even covering it up. But to actually plan a violation? That's pretty extraordinary. This will be the highest penalty EPA ever assesses."

Yeah, but how high? To figure that out, EPA lawyers have a lot to consider. Specifically, EPA will want to know what kind of economic benefit VW got from rigging emissions controls. The company claimed greater engine power, performance, and gas mileage, and charged more for the engine than a gasoline engine in a comparable vehicle. VW also got a marketing benefit, donning a green mantle by touting its "clean diesel" technology.

On the other hand, EPA regulators will also factor in what VW does to fix the problem. The company said Tuesday it was setting aside more than $7 billion for repairs. EPA might build that consideration into its calculations and lower the fine accordingly.

That's all on the civil, regulatory side. DOJ's criminal probe could lead to prosecutions of the executives in Germany who approved the so-called "defeat device." Like the bumper sticker says, a fine is a tax for doing wrong. Prison time, though? That's a whole other kind of serious.

But if you believe Gilbert and Sullivan and think the punishment should fit the crime, than what was this (alleged!) crime's actual shape? Yes, VW diesel-powered Jettas, Passats, Golfs, and Beetles (and an Audi) polluted more during real-world driving than their annual smog tests said they would. But how much more? Tests performed by the International Council on Clean Transportation in 2013 revealed that the VW cars emitted anywhere from 5 to 35 times more nitrogen oxide pollution than allowed by law. So with the help of some air pollution experts, let's do a little back-of-the-envelope figuring. Making it easy on ourselves, we'll use a midpoint of a 20X increase in emissions. Assuming 482,000 cars in the United States with, oh, say, a 120,000-mile lifetime of a diesel engine, VW's US fleet produced 46,657 more tons of harmful, smog-forming NOx pollution than anyone knew.

Now, cars in California alone emitted 161,000 tons of NOx in 2011, according to EPA. (California has a lot of cars.) But still—that's a lot more smog than anyone planned for.

Vox:
http://www.vox.com/2015/9/23/9383641/volkswagen-scandal-pollution

How many deaths did Volkswagen's pollution scandal cause?
A back-of-the-envelope estimate.
Updated by Brad Plumer on September 24, 2015, 8:58 a.m. ET @bradplumer
brad@vox.com<mailto:brad@vox.com>

This week, Volkswagen admitted that it had secretly rigged as many as 11 million diesel cars worldwide so that their pollution controls only worked when they were being tested by regulators. The rest of the time, while the cars were actually being driven, they emitted smog-forming nitrogen oxides at 15 to 35 times higher than the US legal limit.

So how much extra pollution is Volkswagen's deception responsible for? And, since we know air pollution is already harmful, how many additional deaths might those extra emissions cause? What follows is a very rough, back-of-the-envelope estimate based on what we know so far. (Spoiler: the premature death numbers range from single digits to hundreds per year. Like I said, rough.)

1) How much extra pollution do Volkswagen's cars cause? By my calculations, Volkswagen's 482,000 deceitful US cars are currently adding between 5,800 to 14,200 additional tons of nitrogen oxide pollution (NOx) to the atmosphere per year, assuming the cars are driven the US average.*

Extrapolating that out to 11 million cars around the world, and assuming the rest of the cars are driven the European average, we get somewhere between 86,800 and 212,500 additional tons of NOx emissions per year.**

Now, there are lots of assumptions and simplifications embedded in those estimates, particularly around how many miles VW's cars are actually driven. But that's ... potentially a large amount of extra NOx pollution. At the high end globally, it's 20 times what a typical coal plant without emission controls puts out in a year.

2) How many deaths might that extra pollution cause? We know NOx pollution is harmful — current emissions from all the world's cars, trucks, factories, and power plants already cause various health ailments and contribute to thousands of deaths each year. What we're interested in is the additional toll caused by Volkswagen's illegal pollution.

This is a bit trickier to calculate. Certain types of nitrogen oxides are harmful both both because they can irritate the lungs and because they can help form damaging particulate pollution and smog. Higher smog levels have been linked to respiratory illnesses, increased

asthma attacks, and even premature deaths (especially among the sick or elderly). The complicated part is that the exact levels of smog formation can vary from place to place, depending on sunlight, temperature, local winds, and other factors. What's more, the exact harm can depend on where the pollution occurs, how dense the area is, and so on.

Still, we can get ballpark figures using data from the Environmental Protection Agency, which calculates that every ton of NOx from vehicles in the United States leads to somewhere between 0.00085 and 0.0019 premature deaths. (Note that this only includes impacts from particulate formation, not smog effects, which are harder to quantify. See p. 40 of this report.)

Using these figures, the estimated extra pollution from Volkswagen's US cars can be expected to lead to an additional 5 to 27 premature deaths per year. If we extrapolated worldwide to all 11 million vehicles, that would come to somewhere between 74 and 404 premature deaths each year.***

Again, this is a back-of-the-envelope exercise, not a peer-reviewed scientific analysis. Criticisms and refinements are welcome. But the broader point is that air pollution can cause genuine harm, up to and including killing people. The United States and Europe have been trying to limit that health damage over the last 50 years by putting pollution limits in place. And, by evading those limits, Volkswagen's actions had real consequences.

(As counterpoint, Volkswagen's cheating might have been mildly helpful for global warming efforts. The company appears to have rigged the cars so that they would get slightly better fuel economy. And NOx emissions can have an indirect cooling effect. That said, this effect is likely to be smaller in the grand scheme of things. And this really isn't the way to go about solving climate change...)

Footnotes and updates:

* Here's how I estimate US pollution: the current Tier2-Bin5 lifetime standard for NOx emissions in the United States is 0.07 grams per mile driven. Testing by the ICCT has said Volkswagen's 482,000 clean diesel cars in the United States were emitting NOx at 15 to 35 times that standard, depending on how they were driven. And the average US car is driven 11,244 miles in a year. So multiply those numbers together, subtract out the "legal" pollution, convert to tons, and you get your range of additional pollution caused by VW's cars.

(Note that this estimate is for the current year. VW's cars were obviously sold in stages, so the pollution impact is smaller the further you go back in time.)

** For the global figures, I'm assuming the pollution controls in the remaining 10.5 million Volkswagen diesel cars with a Type EA 189 engine worked the same way and produced similar levels of additional pollution. I've updated this section by also assuming the rest of the cars were driven the European average of around 7,170 miles per year (since most of them were likely in Europe). That lowered the global pollution estimates from an earlier

version.

*** This global estimate of health impacts might well be low, since a simple extrapolation from US data isn't ideal. The World Health Organization's research suggests that NOx pollution can have even higher mortality effects in some parts of Europe (due to higher population density), but we'd really have to know where the rest of Volkswagen's 11 million problematic diesel cars are being driven to get any more precise.

Volkswagen and the EPA's Dirty Little Secret
87 SEPT 23, 2015 3:50 PM EDT
By Editorial Board

Cheating reflects badly, first and foremost, on the cheater -- and so it is with Volkswagen, whose shocking manipulation of U.S. emissions tests continues to exact a price in market value, legal costs and reputation. At the same time, it's not unreasonable to ask how the cheating happened in the first place, and that question implicates more than just Volkswagen.

For years, automakers have been able to exploit lax testing systems in the U.S. and Europe. Regulators owe it to both car buyers and the environment to make these systems more rigorous.

As things work now in the U.S., carmakers test their own vehicles and send the results to the Environmental Protection Agency, whose engineers review them and, usually, apply a rubber stamp. The EPA allows manufacturers broad latitude in determining test conditions, an invitation to hanky-panky. The agency does some independent, random testing -- but on just 10 percent to 15 percent of new models. Only in rare cases does it test cars that have actually been driven off the lot.

The problems with this regime were obvious even before VW's shenanigans. In 2013, Consumer Reports found that 55 percent of hybrids and 28 percent of turbocharged cars fell short of their EPA fuel-efficiency ratings. Last year, the Justice Department reached a $350 million settlement with Hyundai and Kia for overstating gas mileage. Ford, Mercedes, Mini and other manufacturers have restated their official mileage ratings in the last three years, usually under threat of consumer lawsuits.

Europe, where automakers also test their own vehicles, has its own issues. Just before the VW scandal broke, a European environmental advocacy group released test results showing major discrepancies between lab and real-world emissions in cars made by BMW, Mercedes and Opel. The European Commission has announced that all passenger cars will be undergo "real world" emissions testing starting in 2017.

Any system will inevitably rely on self-reporting to some extent. Government regulators simply don't have the money or personnel to test every new vehicle. But they can enact safeguards on a system that is all too easy for carmakers to game.

First, the EPA should have some of its engineers on hand at the industry labs to oversee compliance. Carmakers have a bevy of little tricks that can increase efficiency -- low-resistance tires, removing side mirrors and taping over cracks between panels -- and while the EPA has done better than the Europeans at closing loopholes, vigilance must be maintained. The agency should also vary the testing routines periodically so that carmakers won't know in advance exactly what they are in for. (The current regime's predictability may well have been a big part of VW's successful deception.) The EPA should consider following the EU's lead with on-the-road studies, for gas mileage as well as pollutants.

Also, the so-called defeat device VW used to game the emissions test was actually a pretty simple software tweak. It shouldn't be too hard for the EPA to invest in some computer forensic capabilities to track what's going on in our increasingly computerized vehicles.

Just as important, there need to be greater consequences for cheating. Any company caught in violation should lose its self-monitoring rights for a number of years. It should have to dig into its own pockets for trials by neutral third parties, such as parts manufacturers, which have the necessary equipment.

What Volkswagen did appears to be in a category all its own, and it deserves special condemnation. But other carmakers game the system, and regulators tolerate it. That is the dirty little secret of emissions and efficiency testing, and the EPA needs to clean it up.

Financial Times:
http://www.ft.com/intl/cms/s/0/bbd61c58-62d7-11e5-9846-de406ccb37f2.html#axzz3mgG3bZd2

EPA surprised by scale of Volkswagen's deceit
Barney Jopson in Washington and Andy Sharman in London

The US regulator that exposed Volkswagen for cheating on emissions tests has been taken aback by revelations that the German carmaker's deception extended to millions of vehicles far beyond American shores.

"It's clear that the company went above and beyond in its efforts to game the system and

deceive consumers. The agency has a very robust emissions testing programme. So this deceit was significant," according to a senior Environmental Protection Agency official close to the investigation.

The EPA announced on Friday that VW had admitted installing "defeat device" software on 482,000 cars in the US.
But VW then shocked the regulator and the markets — sparking a two-day 37 per cent fall in its share price — by revealing that up to 11m vehicles worldwide could be affected.
"It's been surprising to see the scale of the deceit in terms of the number of vehicles impacted," the official said.

On Thursday the German government said VW executives had admitted to manipulating emissions tests on diesel-powered vehicles in Europe as well as the US.
The EPA official told the Financial Times the US regulator had been "engaged" with the German government over the matter even as it continued its own investigation.

"You'll continue to see news coming out of the agency on this" relating to VW, the official added.
The regulator is also "considering what our options are" regarding other auto manufacturers.
Several companies have come forward to say they have not engaged in similar cheating, the official said, and the EPA will continue working to ensure that is the case.

The EPA's concern about VW behaviour relates not just to the installation of defeat devices but to more than a year of dialogue between the regulator and the carmaker, another EPA official said. During that period VW repeatedly sought to attribute the difference between its cars' test results in the lab and on the road to a "technical glitch".

In May 2014, the EPA and a California state regulator were alerted to emissions discrepancies with a 2012 Jetta and a 2013 Passat by researchers at West Virginia University, which had analysed the results with the International Council on Clean Transportation, a non-profit research group.

Laboratory tests showed the VW cars complied with Clean Air Act rules, but when tested on the road the Passat's emissions were five to 20 times the official test result and the Jetta's emissions were 15 to 35 times the lab reading.

The German carmaker is engulfed in the worst scandal in its 78-year history over findings it manipulated diesel emissions test data in the US and Europe to make its vehicles appear less polluting
Following the West Virginia study, VW continued to assert that the increased emissions from the vehicles could be attributed to "various technical issues and unexpected in-use conditions", according to an EPA letter to VW about the violations last week.

VW tried — and failed — to fix the apparent problem with a voluntary recall last December affecting half a million vehicles in the US.

Only when the EPA told VW that it would not certify its 2016 models as emissions compliant did VW admit to the regulator on September 3 that it had used the defeat device. The EPA carried out additional inquiries over the following 10 days to two weeks before deciding that it would send the company the official "Notice of Violation" released last Friday, the senior official said.

Volkswagen boss quits over diesel emissions scandal
BERLIN | BY ANDREAS CREMER

Volkswagen (VOWG_p.DE) Chief Executive Martin Winterkorn resigned on Wednesday, succumbing to pressure for change at the German carmaker, which is reeling from the admission that it deceived U.S. regulators about how much its diesel cars pollute.

"Volkswagen needs a fresh start - also in terms of personnel. I am clearing the way for this fresh start with my resignation," Winterkorn said, following a marathon meeting with the executive committee of the VW board.

The world's biggest carmaker by sales has admitted to U.S. regulators that it programmed its cars to detect when they were being tested and alter the running of their diesel engines to conceal their true emissions.

Volkswagen did not name a successor, but said proposals on management appointments would be made to a full board meeting on Friday.

Porsche chief Matthias Mueller, Audi chief Rupert Stadler and the head of the VW brand, Herbert Diess, are seen as the front-runners to replace Winterkorn, three people familiar with the matter said. Mueller is seen as the favourite among the three due to his years of experience within the group, two of the people said.

Mueller, a former head product strategist, is also a management board member of Porsche SE (PSHG_p.DE), and so close to the Piech-Porsche family that controls Volkswagen.

Winterkorn, who during his eight years in charge oversaw a doubling in Volkswagen's sales and an almost tripling in profit, said he was shocked that misconduct on such a massive scale had been possible at the company.

The carmaker was under huge pressure to take decisive action, with its shares down more than 30 percent in value since the crisis broke.

German Chancellor Angela Merkel had urged Volkswagen to move "as quickly as possible" to restore confidence in a company held up for generations as a paragon of German engineering prowess.

The U.S. Environmental Protection Agency (EPA) said on Friday Volkswagen could face penalties of up to $18 billion.

Since then the crisis has snowballed, with the U.S. Justice Department launching a criminal inquiry, according to a source familiar with the matter. European and Asian countries as well as Canada have also said they are investigating the matter.

Senior members of Volkswagen's board said in a statement they expected more heads to roll as an internal investigation seeks to identify who was responsible for the wrongdoing.

German Economy Minister Sigmar Gabriel said Winterkorn was taking responsibility for decisions made when he was at the helm of Audi, rather than Volkswagen.

The VW Emission Bug
Why would the company install a 'defeat device' on its U.S. cars?
Sept. 23, 2015 6:38 p.m. ET

Volkswagen AG's reputation and share price have taken major hits after the Environmental Protection Agency and California Air Resources Board (CARB) last week accused the German auto maker of gaming vehicle-emission rules. VW deserves a keelhauling if the charges are true. But regulators and VW first should produce the motive and method for the alleged malfeasance.

On Friday the EPA in conjunction with CARB charged VW with installing "defeat devices" that disable nitrogen oxide emission controls in five of its clean-burning diesel models. EPA has threatened up to $18 billion in fines for the nearly half million cars VW sold in the U.S. between 2009 and 2015 that contain the device. The Justice Department is investigating.

VW's stock has since plummeted nearly a third. On Sunday CEO Martin Winterkorn promised to cooperate with regulators "to clearly, openly, and completely establish all of the facts of this case," including an external investigation. Volkswagen's U.S. chief Michael Horn apologized and said the company had been "dishonest."

On Tuesday VW said 11 million diesel cars world-wide were equipped with the device and it would set aside $7.3 billion, more than half of its annual profits, to cover penalties and recall costs. On Wednesday Mr. Winterkorn resigned. The slow-rolling revelations raise more questions.

To wit: Who decided to install the bugs, and what was their motivation? Did VW executives approve or know? Do the devices serve a purpose other than evading U.S. emission regulations? The public knows little outside the government narrative provided by

EPA and CARB letters to VW last Friday.

The government investigation was prompted by a 2014 research project between West Virginia University and environmental nonprofit International Council on Clean Transportation, which found that NOx emissions from VW's 2012 Jetta and 2013 Passat soared in real world driving conditions and exceeded Clean Air Act regulations by five to 35 times.

After CARB confirmed the disparity between on-road and lab testing, VW in December 2014 recalled a half million cars to make software fixes. In May CARB reran its on-road test and determined that VW's adjustments didn't significantly reduce NOx emissions. CARB says it then met several times with VW, which suggested potential technical justifications for the discrepancy.

However, after the agencies threatened to withhold government certification for its 2016 diesel models, VW on Sept. 3 said the vehicles contained a "defeat device" to disable NOx emission-controls under normal driving conditions.

According to EPA, a software switch senses whether the car "is being tested or not based on various inputs including position of steering wheel, vehicle speed, the duration of the engine's operation and barometric pressure" and these "inputs precisely track the parameters of the federal test procedure." Under normal driving conditions, the switch activates a separate engine calibration.

In other words, the cars are electronically programmed to produce compliant emissions results only during government testing. On highways and streets, they spew 10 to 40 times as much as allowed under U.S. law.

Defeat devices aren't new or a diabolical German invention. As EPA notes, mechanisms that deactivate emissions controls may serve a legal purpose if they protect vehicles against damage. But manufacturers are then required to disclose to regulators their presence in certification applications, which VW didn't.

Two decades ago GM had to cough up $45 million for installing defeat devices in nearly half a million cars that overrode carbon monoxide controls. In 1998 seven U.S. manufacturers of heavy-duty diesel engines, including Caterpillar and Volvo Truck, settled federal charges of implanting devices that disabled NOx controls for $1 billion.

What regulators don't ever explain is that these defeat devices serve a functional purpose, which is usually to increase performance and fuel efficiency. They want to pretend that emissions regulations are a clean, free ride. Until now, VW—which advertised its environmental friendly and powerful engines—was in on the charade.

Auto experts have posited that VW's defeat device was intended to boost fuel economy and torque, which are two big draws of modern diesel cars. VW's 2015 Passat gets 44 miles per gallon on highways. Trouble is, engines that are designed to burn more efficiently—and

therefore emit less carbon—release more NOx. They also have less oomph. EPA and CARB should fess up to this trade-off, and the wrongdoing involved ought to be precisely identified.

The immediate upshot is that VW will have to recall the lemons to bring them in compliance with government rules. Any fix will likely cost several thousand dollars per vehicle, reduce performance and increase carbon emissions. Will drivers even want the government's clean bill of health?

VW deserves to pay for any intentional wrongdoing, but the rest of the industry and the country need to know whether this is the great deception that EPA alleges or the kind of well-known regulatory trade-off that is being harshly punished for the first time.

This Small Study Helped Expose Volkswagen's Deception
Victor Luckerson @VLuck 11:15 AM ET

Their findings have been public for months

Before the Environmental Protection Agency was threatening Volkswagen with up to $18 billion in fines for cheating on emissions tests, a small research team in West Virginia already knew something was wrong with the automakers' vehicles.

A five-person engineering team at West Virginia University led by Daniel Carder first discovered discrepancies in the emissions rates for VW vehicles way back in 2013. The findings were made public about a year and a half ago, according to Reuters. "We actually presented this data in a public forum and were actually questioned by Volkswagen," Carder said.

Carder and his team initially though their testing was faulty because the results of their road tests were so out of whack with EPA standards. The findings were later corroborated by the EPA and the California Air Resources Board, leading to Volkswagen's admission that it installed illegal software in 11 million of its diesel cars to cheat on emissions tests. Volkswagen AG CEO Martin Winterkorn stepped down Wednesday; a replacement has not yet been named.

Carder said seeing his findings confirmed and watching Volkswagen become embroiled in controversy was not especially exciting for him. "Obviously, we don't want to see something spewing emissions and polluting the environment," he told Reuters. "But we really have no horse in the race, as they say."

Detroit News:

http://www.detroitnews.com/story/business/autos/foreign/2015/09/24/vw-caught/72715074/

How VW got caught cheating emissions tests
David Shepardson, Detroit News Washington Bureau 12:14 a.m. EDT September 24, 2015

Washington — Volkswagen's monumental crisis over emissions-test cheating — which forced the resignation of its longtime CEO on Wednesday and threatens to cost the German automaker at least $7.3 billion — began with a routine test led by researchers in West Virginia two years ago.

Without that chance finding, VW might never have been caught using a bit of hidden software that allows pollution-control systems on 2.0-liter diesel cars to work normally when being tested for harmful emissions coming out of the tailpipe — but shuts those systems off during regular driving. That allowed 11 million cars worldwide to produce up to 40 times the allowable smog-forming pollution allowed in the United States.

"We're a tiny, non-governmental organization," Drew Kodjak, executive director of the International Council for Clean Transportation, said in an interview Wednesday. "It was really happenstance that this was ultimately uncovered."

In 2013, his organization commissioned a study of VW diesels by West Virginia University after questions were raised about European diesel emissions standards and whether European vehicles were emitting too much nitrogen oxides linked to smog. Testers looked at three diesel cars for the U.S. market: a 2012 VW Jetta, a 2013 VW Passat and a BMW X5.

The group expected the cars they tested would perform better than those in Europe, because U.S. regulations are tougher. They were surprised the two Volkswagens had significantly higher-than-expected emissions, while the BMW performed well. They were so certain they had done something wrong that they tested the cars two more times with similar results.

The researchers made their findings public in May 2014 in a report that got little attention. But it caught the notice of the Environmental Protection Agency and California Air Resources Board, which opened investigations.

The Detroit News has learned that, in response to tests by the EPA and CARB, the automaker actually issued two separate recalls labeled as service campaigns for certain cars: one in December 2014, another in March. Software patches were VW's remedy, and the automaker assured the EPA and CARB that they fixed the problem. Out of 390,000 cars identified by VW at the time, about 196,000 were reflashed with new software.

CARB began testing VW's remedy in May. The California agency had developed a special dynamometer that showed the emission controls in the Volkswagens were not working properly. The software patch, in fact, did not cut exhaust emissions.

At the time, government officials never suspected VW was intentionally cheating. They

kept looking for other potential problems. All summer long, VW kept offering "explanation after explanation," a person involved in the talks said Wednesday. "They did not add up."

Even through early August, government officials believed the automaker was acting in good faith. They thought other issues like a bad "dosing sensor" or a test problem could have accounted for the results.

In early August, EPA and CARB officials met with VW at an annual automotive conference in Traverse City to talk about the problem. By that time, California and EPA were withholding certification allowing 2016 diesel models to be sold until they were sure the recall fix would address the problem. VW said it had everything fixed.

Finally, at a conference in California on Aug. 20, an official from VW could not answer technical questions and admitted it had been intentionally cheating through so-called "defeat devices."

After months of work and testing, government officials were shocked at VW's admission of fraud.

The deception was sophisticated: Electronic control modules told the emissions controls to only work during emissions testing — something the computer could determine by the steering wheel position and other factors. That turned out to be a big clue for government investigators.

In a typical car, a dashboard indicator is supposed to light up if it's emitting more than allowable emissions. The Detroit News has learned the VW diesels were programmed not to activate those onboard diagnostics required of all cars since 1996 under the Clean Air Act.

On Friday, the EPA and CARB announced Volkswagen had admitted to installing defeat devices on 482,000 2009-15 Volkswagen Jetta, Passat, Sportwagen, Beetle and Audi A3 cars with 2.0-liter engines sold in the U.S. That included the 390,000 cars initially identified by the automaker, plus another 92,000. The cheat caused the cars to emit 10-40 times the allowable pollution.

By Tuesday, the automaker disclosed that 11 million diesel cars worldwide may have evaded clean-air rules. It could face U.S. fines of up to $18 billion — $37,500 per vehicle — as well as criminal prosecution.

People are shocked at the fraud, Kodjak said, "because of the deliberate nature, and the fact that this came from one of the greenest countries that's known for being extremely law-abiding."

Analysts speculated there are only three advantages to such a device: VW may have wanted to get higher fuel economy for the cars, better performance or avoid more expensive emissions controls like those on larger diesel VWs.

Industry, government and researchers say the automaker could have avoided criminal investigations and massive worldwide lawsuits linked to the admission that they cheated on emissions tests if their software fix had actually worked.

"Why didn't it work? That is literally one of my biggest questions is why didn't it work," Kodjak said. If it had, investigators may never have learned about VW's intentional fraud. "California told you they were going to check. If they had just fixed it then ... the only answer I can surmise is it is not easy."

Government officials expect VW will have to come up with three separate fixes since there are three generations of diesel engines that use different systems to prevent the release of smog-causing nitrogen oxides. It is not yet known whether a new software patch will suffice, or if new pollution-control equipment must be installed.

Boston Globe:
https://www.bostonglobe.com/business/2015/09/23/how-many-volkswagen-vehicles-massachusetts-are-affected-recall-lot/nxliz8S0LU9v5aEPyXbNmJ/story.html

How many Volkswagen vehicles in Mass. are affected by the recall? A lot
By Callum Borchers GLOBE STAFF SEPTEMBER 23, 2015

The tally is in on the number of diesel-engine Volkswagens in Massachusetts that will be subject to recall: 11,674.

According to the Registry of Motor Vehicles, that's how many cars fit the makes, models and years identified by the US Environmental Protection Agency as having a so-called "defeat device" that made them appear cleaner in emissions tests than they actually were on the road.

The EPA determined the vehicles — marketed as "clean" diesel cars — spew as much as 40 times what federal pollution limits allow.

Volkswagen chief executive Martin Winterkorn resigned Wednesday but claimed he did not know about the company's effort to cheat emissions tests, saying he was "stunned that misconduct on such a scale was possible in the Volkswagen Group."

Combining the EPA's description of affected vehicles with RMV statistics, the following list shows how many diesel cars of each type have been recalled in Massachusetts:

• Jetta model years 2009 to 2015: 3,562

• Jetta Sportwagen model years 2009-2014: 3,926

• Beetle model years 2012 to 2015: 81

• Beetle Convertible model years 2012 to 2015: 95

• Golf model years 2010 to 2015: 1,489

• Golf Sportwagen model year 2015: 159

• Passat model years 2012 to 2015: 1,998

• Audi A3 model years 2010 to 2015: 364

The EPA said roughly 482,000 cars nationwide are affected by the recall, and Volkswagen said the worldwide total exceeds 11 million.

The Tennessean:
http://www.tennessean.com/story/news/politics/2015/09/22/tn-senate-leader-requests-hearing-on-volkswagen-issues/72625196/

TN Senate leader requests hearing on VW cheating issues
Dave Boucher

A leader in the Tennessee Senate is asking a fellow lawmaker to call a hearing to look at how cheating revelations regarding Volkswagen may affect the state.

Senate Speaker Pro Tem Bo Watson, R-Hixson, notes the German automaker's significant investment in Tennessee as a reason he wants Senate Finance, Ways and Means Committee Chairman Randy McNally, R-Oak Ridge, to schedule a hearing.

"While all of the relevant facts may remain unreported at this time, I am very concerned as to the financial impact these violations could present to the state of Tennessee," Watson writes.

"As the chairman is aware, Tennesseans have made a significant investment in Volkswagen and any action that threatens the stability and sustainability of the investment should be reviewed by the finance committee, without delay," he continued later in the letter.

Tennessee provided Volkswagen with $165 million in grants in connection to its massive facility in Chattanooga, where more than 3,200 people are employed. Volkswagen received more than $577 million in incentives to build the plant in Chattanooga in 2008, The Associated Press reported. The AP also noted another state and local package worth up to

$300 million was offered last year to persuade VW to expand the Chattanooga plant to build a new SUV in Tennessee as opposed to elsewhere.

Volkswagen CEO Martin Winkerton apologized Tuesday in the wake of accusations from the U.S. Environmental Protection Agency that the company had intentionally installed software that allowed its cars to cheat in emissions tests. The company said the emissions software affected 11 million cars worldwide.

On Tuesday it was reported the company has set aside more than $7 billion in anticipation of fines. USA TODAY reported recently that the car company could face $18 billion in fines from the federal government.

Volkswagen sets aside $7.3B over emissions scandal

On Monday Gov. Bill Haslam said he was concerned when he heard the revelations. He said he'd only spoken briefly with representatives from the EPA and Volkswagen.

"Volkswagen is somebody that is a major partner for us in the state of Tennessee, both in terms of investment and the jobs created. We're obviously very interested in their continued growth, but they're going to have to address this issue," Haslam told reporters Monday.

Lt. Gov. Ron Ramsey, R-Blountville, told the Chattanooga Times Free Press that the revelations are "depressing, hard to believe. On and on. We've made a huge investment."

Watson asked McNally to call the public meeting to discuss potential impact on Tennessee as soon as possible.

Volkswagen Sets Aside $7.2 Billion to Pay for Emissions Cheating Scandal
by PAUL A. EISENSTEIN

Volkswagen said Tuesday it is setting aside more than $7.2 billion to cover the anticipated cost of resolving its diesel emissions cheating scandal, a figure that could be eclipsed by potential penalties and lawsuits facing the German automaker in the U.S.

The issue, meanwhile, now is spreading to other markets, with VW confirming it used the same illicit software - dubbed a "defeat device" by U.S. regulators - on 11 million diesel vehicles sold worldwide. That has triggered calls for new investigations in markets from South Korea to the European Union.

The money that VW is setting aside, 6.5 billion euros, is part of the company's efforts to "win back the trust of our customers," VW said in a statement Tuesday.

Meanwhile, it noted that it is "working intensely" to find a technical solution to removing the software without reducing the performance of affected VW products. A total of 488,000 VW and Audi brand vehicles equipped with four-cylinder engines were recalled Friday, while the automaker ordered dealers to stop selling products equipped with those diesels.

Concerns about the mounting costs and potential impact to VW's reputation have led to a panic among the company's investors. On Monday, the value of VW shares plunged by 17 percent, and the sell-off was continuing midday Tuesday on the German exchange.

The crisis could lead to a shake-up in management at Volkswagen AG, industry analysts have warned.

The U.S. Environmental Protection Administration announced Friday that the automaker had surreptitiously equipped its diesel vehicles with software designed to recognize when those products were being tested on a dynamometer, essentially an automotive treadmill. In such a situation, the full complement of emissions controls systems would operate at their maximum, bringing the vehicles into compliance with U.S. - and even tougher California - emissions standards.

But once the testing would be completed, according to the EPA, the vehicles would revert to a different mode, effectively allowing emissions levels to increase by as much as 40 times.

In its new statement, VW gave more details, admitting that "discrepancies" related to vehicles with Type EA 189 engines and involved some 11 million vehicles worldwide.

"A noticeable deviation between bench test results and actual road use was established solely for this type of engine," the VW statement said. "Volkswagen is working intensely to eliminate these deviations through technical measures."

While the maker acknowledged the computer control systems on 11 million vehicles contain the code, it also claimed that the "majority of these engines the software does not have any effect."

The U.S. has the world's toughest diesel emissions standards, largely focusing on levels of micro-fine particulates and smog-causing oxides of nitrogen. In Europe, where the emphasis is on global warming gases like CO2, diesels handily meet test standards because they are so energy efficient.

Even so, there are mounting calls in Europe for a full investigation of the VW diesel test scandal, and CEO Martin Winterkorn has told Germany's transit ministry the company will fully cooperate with its investigation. Officials in South Korea also have called for an investigation.

Meanwhile, the U.S. Justice Department has reportedly taken the preliminary steps to open a criminal investigation.

Whether the $7.3 billion set aside is enough to cover VW's costs from the scandal remains to be seen. According to EPA rules, VW could be fined up to $37,500 for each vehicle not in compliance with emissions regulations, or a total of around $18 billion. California regulators could issue their own fines.

Several law firms also have taken initial steps of their own to bring class action lawsuits against Volkswagen on behalf of owners.

But perhaps the biggest question concerns the impact the scandal will have on VW's image and sales. The maker overtook Toyota to become the world's best-selling automaker during the first half of 2015. But it has been struggling to build momentum in the critical American market where about a quarter of its sales are diesel-powered vehicles. For now, VW has halted the sale of those models until it can come up with a fix for the faulty software.

Bloomberg (via Chicago Tribune):
http://www.chicagotribune.com/news/sns-wp-blm-news-bc-vw-states22-20150922-story.html

Volkswagen probed by states over pollution cheating
Christie Smythe, Bloomberg News

Several states have begun an investigation into Volkswagen's admission that it equipped cars with technology to cheat federal air pollution tests, joining federal investigators and a growing list of countries probing the German automaker.

Wolfsburg, Germany-based Volkswagen said on Sept. 18 that it used "defeat device" software to beat emissions tests in labs. The diesel vehicles spewed as much as 40 times the legal limit of pollutants when they were on the road, the Environmental Protection Agency alleges. Volkswagen said it's cooperating with U.S. officials.

The matter may cost Volkswagen $18 billion in penalties from the EPA, based on a maximum $37,500 violation for each of nearly a half-million diesel versions of the VW Jetta, Golf, Beetle and Passat and the Audi A3.

Matt Mittenthal, a spokesman for New York Attorney General Eric Schneiderman, said in an e-mail today that he could confirm New York is part of the multistate group but was unable to say what other states were part of the probe.

The U.S. Justice Department has also begun a criminal probe, according to officials who spoke on a condition of anonymity.

The German government opened its own probe on Tuesday. Environment Canada also started an investigation, promising unspecified "enforcement action" if the car maker cheated in that country.

Volkswagen Debacle on Financial Par With BP Oil Spill
SEPT. 22, 2015
By ANTONY CURRIE and OLAF STORBECK

— Volkswagen's cheating on clean air rules in the United States has driven investors into a deep funk.

The German carmaker's market capitalization shrank 16.6 billion euros, or $18.6 billion, in just over a day, after it was caught falsifying emissions on certain cars sold in the United States. The eventual cost could be higher. Although other carmakers have paid less for misdeeds, the better analogy might be oil: BP's 2010 Deepwater Horizon fiasco.

Rival carmakers got off relatively lightly for recent transgressions in the United States with more disastrous immediate consequences. General Motors paid $900 million to settle a lawsuit over faulty ignition switches linked to 124 deaths. Toyota paid $1.2 billion last year for malfunctioning accelerators tied to fewer fatalities.

No deaths can be directly pinpointed to Volkswagen blocking accurate checks on emissions – though the software installed in some vehicles hid levels of harmful nitrogen oxide up to 40 times above permitted levels.

The environmental twist perhaps makes BP's disastrous Gulf of Mexico oil spill a better comparison. Initial total cost estimates by analysts were as low as $3.5 billion. The final bill under the Clean Water Act was $5.5 billion, less than half the maximum fine. But BP's other costs, including damages, ballooned. All in, BP ended up setting aside almost $55 billion in fines, compensation and cleanup costs.

The Clean Air Act allows the Environmental Protection Agency to charge up to $37,500 a vehicle for any breaches. With 482,000 affected cars, that's $18 billion. The E.P.A. could be kinder than that, but Volkswagen, run by Martin Winterkorn, cheated government tests for six years, dissembled when confronted and meanwhile lauded Volkswagen's status as an environmentally sustainable carmaker.

Volkswagen can pay $18 billion, over time, and retain its credit rating. It has €21 billion in net cash, with more coming from planned divestitures.

That, though, doesn't factor in other costs, including recalls, refits, vehicle buybacks and class-action lawsuits – or the possibility that Volkswagen's emissions shenanigans were more pervasive. Diesel cars account for more than half its sales in Europe, its largest market, though with more lenient nitrogen oxide standards. If the scandal undermines the business case for Volkswagen's diesel engines, a €16.6 billion drop in value will look like a country jaunt.

Anatomy of Volkswagen's deception: The recall that never fixed any cars.
By Peter Whoriskey and Joby Warrick September 22 at 12:20 PM

Volkswagen's decision to equip 11 million vehicles with devices to cheat emissions tests worldwide has sent the company into an acute corporate crisis in recent days. But on December 2, 2014, the company assured U.S. and California regulators that their engineers had a straightforward solution.

Volkswagen told officials then that a software change would remedy the overflow of pollution emitted by their diesel cars, according to state and federal letters to the company. At the time, Volkswagen proposed a "voluntary recall" of about 500,000 vehicles. State and

federal officials approved the plan.

That fix was either a technical failure or, some officials said, another ruse.

By May of this year, California tests showed that "the recall calibration did reduce emissions to some degree but NOx emissions were still significantly higher than expected."

The extent of the recall, which is discussed in letters between government and company officials, is unknown. Company officials wouldn't say this week how many recall notification letters Volkswagen issued to consumers, and how many consumers brought their cars in for the purported fix.

But the incident is one of the highlights in what federal and state officials have likened to a cat-and-mouse game between regulators and one of the world's largest automakers.

"They basically ran out of excuses," said Stanley Young, spokesperson for the California Air Resources Board. "They would say the tests weren't at the right temperature, or some other issue. We had them in [to our offices] several times."

EPA administrator Gina McCarthy said on Tuesday that the agency would step up efforts to look for cheating by other manufacturers, though she suggested that Volkswagen was an "outlier" in the extent of its cheating to defeat emissions standards.

"We are not going to sit down around and worry about whether or not there are other devices. We're going to find it," she said. "So right now we're upping our game in terms of going out and doing the work to take a look at what we need to do with other vehicles."

The company's dire diesel troubles have erupted over just a few days, but they were a long time in gestation.

The regulations that shaped the design of the diesel engines were put in place more than 15 years ago, when the EPA finalized rules that raised the emission standards for diesel cars.

After a years-long grace period, the tough standards were phased in between 2004 and 2007. At the time, the government acknowledged that meeting the standards for NOx, or nitrogen oxide, as well as soot, would be difficult.

"Manufacturers have expressed concerns that diesel-fueled vehicles would have difficulty meeting NOx and particulate matter levels like those contained in today's rule," EPA officials wrote in issuing the new standards. "Clearly, these standards will be challenging."

For a time, Volkswagen and other automakers stepped back from the U.S. diesel car market. It was a time to retool. Experts said the challenge of making a diesel engine clean enough for the U.S. standards - without compromising how the engine works - is very difficult.

"NOx is more of a challenge for diesel engines than it is for gasoline engines," said John

Storey, distinguished research and development staff member at Oak Ridge National Laboratory. "The strategies companies use to clean them up all have an impact on performance, fuel economy and maintenance."

The engineering hurdles in controlling diesel emissions are high enough, some experts said, that they may provide an incentive for companies to skirt the rules.

"I can't say I'm surprised," John M. DeCicco, Ph.D. Research Professor at the University of Michigan Energy Institute, of the recent revelations. "The temptation to game the system with a defeat device is definitely high because of the technical challenges."

In 2008, Volkswagen came back with a diesel version of the Jetta. The company touted it as an example of the "clean diesel." It won raves, including "Green Car of the Year" at the Los Angeles Auto Show.

"After a three-year break that seemed interminable to fans, Volkswagen's back in the U.S. diesel-car market with a clean-burning diesel in its popular Jetta compact sedan," USA Today told readers.

But what seemed like a breakthrough seems now, in the light of recent revelations, like a massive cheat.

The company's two-liter diesel engines in the U.S. had been equipped with a "defeat device" that allowed the cars to pass federal emissions tests despite emitting more than 10 times the permitted amounts of NOx when it is on the road. Those emissions help produce smog on hot summer days, triggering a variety of health problems, particularly for asthmatics and other people with breathing difficulties.

As has been widely reported, the emission problems were detected in a May 2014 report by the International Council on Clean Transportation and West Virginia University.

The results were presented to the company and several months later, in December 2014, the company told California regulators that they had a fix. They would "recalibrate" the software that runs the engine.

"Based on this meeting, VW initiated a voluntary recall...This recall was claimed to have fixed among other things, the increased real world driving NOx issue," according to a recent letter from the California Air Resources Board to the company.

By May of this year, California officials had run road tests on cars altered as under the recall. Despite the fix, the car showed higher than expected NOx emissions. California engineers also created a special dynamometer test, apparently to address company concerns that the previous testing was unfair.

California Air Resources Board "has determined that the previous recall did not address the high on-road NOx emissions, and also resulted in the vehicle failing certification

standards," it told the company earlier this month.

McCarthy, speaking to reporters in Washington, acknowledged that the Volkswagen software ruse was "particularly difficult for us to detect. We haven't found similar types before but we'll take a look and make sure we're attacking it successfully," she said.

McCarthy defended the EPA's regulatory standards as reasonable, and said most other car manufacturers appear to have found a way to comply.

"This is about a NOX emission standard that was put in place a few decades ago. The industry knew what was happening. We feel pretty confident the industry has been innovating to be able to meet this standard," she said. "So we don't think that this problem with the standards at all."

McCarthy said she was gratified by Volkswagen's aggressive response in acknowledging its mistakes, even as she criticized the company for its years of deliberate deception.

"I think it will be very difficult for Volkswagen at this going to be looked at as anything other than a real outlier," she said.

How VW's 'defeat device' cheated on EPA emissions tests
Clive Cookson, Science Editor

The "defeat device" that Volkswagen used to cheat on US emissions testing sounds as if a secret little black box was hidden deep in the diesel engine just waiting to switch anti-pollution controls on during government inspections.

During normal driving, these controls are relaxed, which improves performance and reduces engine wear.

"The test cycles are very formal and well established, so priming a vehicle to sense when it is being tested is potentially quite straightforward," said Professor Alastair Lewis, an air pollution expert at York University in the UK. "For example are only its drive wheels turning, is the acceleration unnaturally smooth, or constant speeds too precise for a human

driver?"

Modern "clean diesel" engines aim to reduce pollution in a series of computer-controlled steps. For example, the computer may adjust the ratio of air to fuel in the combustion chamber, change the operating temperature or alter the rate at which exhaust gases flow through catalytic converters and filters.

Another refinement is to inject a chemical called urea into the exhaust stream. It then reacts with polluting nitrogen oxides (NOx) and converts them into harmless nitrogen and water.

"A huge amount of complex electronics controls it all," said Roger Kemp, professor of engineering at Lancaster University. "The code in the software gives thousands of different usage patterns corresponding to different combinations of inputs.

"There is a trade-off between pollution control and engine performance," Prof Kemp added. For example running at a hotter temperature may cut emissions but reduce engine life.

Bosch, the German car parts company, supplies components to VW, including fuel injection and exhaust treatment systems that reduce emissions. But people familiar with the cars said VW writes the software that deploys the equipment.

According to the EPA's notice of violation, the software ran the engine with "dyno calibration" settings designed to minimise pollution when it detected testing in progress (dyno refers to dynamometer equipment at the test centre). For the rest of the time it ran on "road calibration" which puts less emphasis on reducing emissions.

Even when the software switches to road running, a modern diesel engine is much less polluting than its filthy predecessors, Prof Kemp pointed out. Its filters and combustion chamber are particularly effective at cutting emissions of the tiny soot particles that used to belch out of ill-tuned engines (and still do in parts of the developing world).

The EPA allegations focus on NOx, reactive gases that are one of the main sources of urban smog and lung-irritating ozone pollution. The violation came to light when researchers at West Virginia University tracked emissions from VW diesel cars on the road and found that NOx soared to levels 10 to 40 times higher than the EPA permits.

Many air pollution experts have long believed that other manufacturers operate their own versions of VW's defeat devices.

"Virtually all new vehicles in recent years appear to emit substantially more NOx in the real-world than they do when tested in labs, irrespective of manufacturer," said Prof Lewis. "VW appear to have been caught red-handed, but it would seem highly likely that others have also played dubious games to pass emissions tests."

Ian Colbeck, professor of aerosol science at the University of Essex, commented: "It has been observed for some time that real world driving conditions do not deliver the emission

reductions shown in the laboratory. The European Commission will require real world tests in 2017."

Volkswagen emission scandal widens: 11 million cars affected
Nathan Bomey

Investors crush Volkswagen shares as company sets aside $7.3 billion to address software that manipulates emissions tests.

Volkswagen's emissions scandal ballooned Tuesday as the automaker said it affects 11 million vehicles worldwide and will require the company to set aside 6.5 billion euro ($7.3 billion).

The startling admission instantly makes the crisis one of the most expensive automotive scandals in recent memory.

The crisis also threatens to upend the company on its rapid path to becoming the world's largest automaker. Volkswagen had seized the title from Toyota for the first six months of 2015.

"This could damage the Volkswagen brand globally for years to come," said former automotive marketing executive Peter De Lorenzo, blogger at Autoextremist.com, in an interview. "Trust and belief in the brand has been broken."

Volkswagen CEO Martin Winterkorn pledged to regain the public's trust and rectify the company's mistakes, amid speculation that he could lose his job over the crisis. Winterkorn's contract, coincidentally, is up for renewal at the automaker's board meeting Friday.

In a video statement Tuesday he said he's "endlessly sorry" for the situation but pledged to stay on the job, according to several reports translating the German remarks.

Investors crushed the Germans automaker's stock, driving shares down 18% as of 9:47 a.m. ET, a day after the stock plunged 19%.

The crisis began Friday when the U.S. Environmental Protection Agency accused Volkswagen of installing sophisticated software on nearly 500,000 U.S. vehicles to manipulate emissions tests.

The technology tricks regulators into believing that 4-cylinder diesel vehicles comply with emissions standards, but the cars are actually admitting harmful pollutants at rates of up to

40 times acceptable standards. Volkswagen quickly halted sales of the cars after the allegations surfaced.

The U.S. Justice Department has opened a criminal probe into the automaker's actions. The EPA's own investigation is ongoing, and foreign regulators are expected to launch their own probes.

"Volkswagen is working at full speed to clarify irregularities concerning a particular software used in diesel engines," the company said Tuesday in a statement.

The "discrepancies" affect vehicles with what it called "Type EA 189 engines," causing "a notable deviation between bench test results and actual road use."

The company added: "Volkswagen is working intensely to eliminate these deviations through technical measures."

Volkswagen said it would set aside 6.5 billion euro in its third quarter to address the matter and warned that the number could change.

In the U.S., the EPA could fine Volkswagen up to $37,500 per car, which would equal a maximum fine of some $18 billion.

"Volkswagen does not tolerate any kind of violation of laws whatsoever. It is and remains the top priority of the Board of Management to win back lost trust and to avert damage to our customers," the company said.

The scandal raises serious questions about whether high-level executives knew about the software, which had been installed on some nameplates for at least six consecutive model years.

Earlier this month a subcommittee of Volkswagen's board recommended that the full panel extend Winterkorn's contract through 2018. The official renewal at Friday's board meeting was viewed as a routine matter, but now it may be up in the air.

Winterkorn kept his job earlier this year after then-chairman Ferdinand Piech tried to displace him. Piech exited the company shortly after his failed effort.

De Lorenzo, the automotive marketing veteran, said Winterkorn will be forced to answer questions about his knowledge of the emissions scandal.

"He’s very much detailed-oriented. He’s always regaled his underlings with his depth of knowledge of detailed items that they would assume he wouldn’t bother with," De Lorenzo said. "I think heads will roll and this could bring down Winterkorn and some of his trusted lieutenants."

Dave Sullivan, an analyst with AutoPacific, said the "chances of him coming out unscathed

have got to be very small."

The EPA has said the company admitted to installing the software. The agency said the software affected the four-cylinder diesel versions of the 2009 to 2015 Jetta, Beetle, Golf, the 2014 and 2015 Passat and the 2009 to 2015 Audi A3.

The episode is likely to trigger a recall and a flurry of consumer lawsuits. It may prompt the company to compensate individual car owners or other measures.

European regulators are expected to place Volkswagen under intense scrutiny. But it scandal also could bode poorly for Volkswagen in the world's largest vehicle market, China, where Volkswagen is No. 1 by market share.

"The problem is the Chinese are starting to realize they have got to do something with their air and this could have an effect on the relationship the Chinese have with Volkswagen," Sullivan said.

The Environmental Protection Agency is working on new tests to detect cheating on the part of automakers in the wake of Volkswagen AG's massive cheating scandal.

EPA Administrator Gina McCarthy told reporters at a Wall Street Journal forum on Tuesday that the agency won't sit still and is "upping its game" to catch cheaters.

VW was able to evade U.S. emissions requirements for 482,000 2009-2015 diesel cars by using sophisticated software that only turned on emissions equipment during testing. It's not clear if VW did that to boost low-end torque, raise fuel efficiency or avoid more costly emissions requirements.

The fact that VW was able to get away with the cheating for nearly seven years suggests the agency must take new steps to detect bad behavior, analysts say. Cars are very sophisticated machines with more than 100 million lines of code.

The VW emissions issue came to the attention of the EPA in 2014 after independent analysis by researchers at West Virginia University — working with the International Council on Clean Transportation, a non-governmental organization — raised questions about emissions levels. After extensive testing, EPA confirmed that the vehicles were emitting up to 40 times the allowable pollution in road use.

The EPA told The Detroit News on Friday that it was investigating whether other automakers had similar problems. But McCarthy said so far it appears VW is an "outlier."

This will not be the first time in recent years that EPA has had to change its rules to ensure companies are complying with emissions.

In February, the EPA issued new guidelines to automakers for conducting fuel economy testing. The move came after five major automakers have had to restate mileage ratings for

certain models.

The guidelines detail how vehicles must be prepared before being tested — including what is an acceptable level of wear on the tires and how vehicles should be broken in prior to testing.

Also at issue are tests used to determine the impact of aerodynamic drag and tire rolling resistance on gas mileage. Currently, that is measured at 50 miles per hour. Under the new guidelines, automakers must measure the results at all speeds up to 70 mph.

In 2014, the agency said it was considering writing new formal regulations covering mileage labeling by automakers. Instead, it is opting to issue the guidelines. It typically takes EPA two to three years to write new legal binding mandates.

Chris Grundler, the EPA's director of the Office of Transportation and Air Quality, said in an interview in February that "it's a very dynamic time" in the auto industry, and the agency doesn't want to spend several years crafting rules that could be outdated when issued.

"Writing regulations takes time," Grundler said. "When you are working in the rapidly changing environment that we're in right now, we want to make sure that we are agile enough and flexible enough to change with those times."

He said new guidelines are aimed at getting better results. He noted that the EPA will follow the guidelines when it conducts audits of automaker testing.

In November, Korean automakers Hyundai Motor Co. and Kia Motors Corp. agreed to a record-setting $360 million settlement for overstating fuel economy ratings for 1.2 million 2011-13 U.S. vehicles. The settlement includes a $100 million civil penalty, forfeiting $210 million in greenhouse gas emission credits and spending $50 million to ensure independent auditing of its current and future vehicles.

After an investigation by the EPA, Hyundai and Kia in November 2012 agreed to restate expected gas mileage for 1.1 million vehicles in North America, including 900,000 in the United States. That reduced Hyundai-Kia's fleetwide average fuel economy from 27 to 26 mpg for the 2012 model year. Hyundai was forced to abandon claims that four models got 40 mpg.

In August 2013, Ford Motor Co. dropped mileage ratings for the 2013 C-Max hybrid from a combined 47 mpg to 43 mpg. In June 2014, Ford Motor Co. said it is lowering the fuel ratings on six new cars and would make payments of $125 to $1,050 to more than 200,000 owners.

The move was a significant embarrassment to Ford, which has emphasized the fuel efficiency of vehicles in its lineup. It was he second time in a year that Ford has had to correct its mileage numbers.

Under current rules, Ford was able to assign the same fuel efficiency rating to the C-Max as the Fusion hybrid because they're in the same family. While that's worked for conventional cars, it hasn't been as accurate for hybrids.

Other German automakers besides VW have faced EPA scrutiny. In October, BMW AG agreed to reduce its fuel economy ratings on four 2014 Mini Cooper models.

BMW reduced the combined fuel economy of the three-door manual transmission to 33 miles per gallon from 34 mpg, the three-door semi-automatic from 33 to 32, the Cooper S 3-door manual from 29 to 28 and the semi-automatic version from 31 to 30. The biggest fall is in the highway rating for the Cooper S 3-door manual will fall from 38 to 34 mpg.

Also last year, another Daimler AG agreed to lower the mpg ratings on two of its Mercedes-Benz vehicles after a government audit turned up a problem.

Mercedes-Benz made minor changes to two models. It will reduce the city mpg figure for the 2013-14 C300 to 19 mpg from 20 mpg, but the combined 22 mpg and 27 mpg highway value will remain the same. For the 2013-14 4-Matic PZEV the combined mpg fell to 22 mpg from 23 mpg, while the city and highway mpg figures both fell by 1 mpg to 19 and 28, respectively.

VW CEO: 'Endlessly sorry' as emissions scandal escalates
By Geir Moulson and Pan Pylas | AP September 22 at 11:32 AM

BERLIN — The crisis enveloping Volkswagen AG, the world's top-selling carmaker, escalated Tuesday as the company issued a profit warning following a stunning admission that some 11 million of its diesel vehicles worldwide were fitted with software at the center of a U.S. emissions scandal.

The German company said it was setting aside around 6.5 billion euros ($7.3 billion) to cover the fallout from the scandal that has tarnished VW's reputation, raised questions over the future of CEO Martin Winterkorn and battered its share price.

Winterkorn pledged a fast and thorough investigation.

"Millions of people across the world trust our brands, our cars and our technologies," he said in a video message. "I am endlessly sorry that we have disappointed this trust. I apologize in every way to our customers, to authorities and the whole public for the wrongdoing."

"We are asking, I am asking for your trust on our way forward," he said. "We will clear this up."

The VW Logo is photographed at a car at the Car Show in Frankfurt, Germany, Tuesday, Sept. 22, 2015. Volkswagen has admitted that it intentionally installed software programmed to switch engines to a cleaner mode during official emissions testing. The software then switches off again, enabling cars to drive more powerfully on the road while emitting as much as 40 times the legal pollution limit. (Michael Probst/Associated Press)
The damage to Volkswagen's reputation is reflected in the market's response. Volkswagen's share price slid a further 16.2 percent Tuesday to a near four-year low of 112 euros. The fall comes on top of Monday's 17 percent decline.

The trigger to the company's market woes was last Friday's revelation from the U.S.'s Environmental Protection Agency that VW rigged nearly half a million cars to defeat U.S. smog tests.

The company told U.S. regulators that it intentionally installed software programmed to switch engines to a cleaner mode during official emissions testing. The software then switches off again, enabling cars to drive more powerfully on the road while emitting as much as 40 times the legal pollution limit.

"In my German words: we have totally screwed up," the head of Volkswagen's U.S. division, Michael Horn, told an audience in New York on Monday.

In a statement Tuesday, Volkswagen gave more details, admitting that there were "discrepancies" related to vehicles with Type EA 189 engines and involving some 11 million vehicles worldwide. The number of vehicles involved is more than the 10 million or so cars it sold in 2014.

Volkswagen said it is "working intensely" to solve the problem and that it "does not tolerate any kind of violation of laws whatsoever."

To cover the necessary service measures and what Volkswagen says are "other efforts to win back the trust" of customers, the company said it is setting aside some 6.5 billion euros in the current quarter. There was no mention of fines or penalties in the company's statement. The EPA has indicated that it could, in theory, fine VW up to $18 billion.

The Guardian:
http://www.theguardian.com/business/2015/sep/22/vw-scandal-caused-nearly-1m-tonnes-of-

extra-pollution-analysis-shows

VW scandal caused nearly 1m tonnes of extra pollution, analysis shows
Emissions could have far greater impact in Europe, where almost half passenger cars are diesel, than the US
Karl Mathiesen and Arthur Neslen

Volkswagen's rigging of emissions tests for 11m cars means they may be responsible for nearly a million tonnes of air pollution every year, roughly the same as the UK's combined emissions for all power stations, vehicles, industry and agriculture.

The carmaker has recalled 482,000 VW and Audi brand cars in the US after the Environmental Protection Agency (EPA) found models with Type EA 189 engines had been fitted with a device designed to reduce emissions of nitrous oxides (NOx) under testing conditions.

A Guardian analysis found those US vehicles would have spewed between 10,392 and 41,571 tonnes of toxic gas into the air each year, if they had covered the average annual US mileage. If they had complied with EPA standards, they would have emitted just 1,039 tonnes of NOx each year in total.

On Tuesday the company admitted the device may have been fitted to 11 million of its vehicles worldwide. If that proves correct, VW's defective vehicles could be responsible for between 237,161 and 948,691 tonnes of NOx emissions each year, 10-40 times the pollution standard for new models in the US. Western Europe's biggest power station, Drax in the UK, emits 39,000 tonnes of NOx each year.

In the US, just 3% of passenger cars are diesel compared to almost half in the EU. Professor Martin Williams from King's College London said the US's low percentage of diesel cars meant higher diesel emissions in some cars would have a "limited effect" on air quality there.

"[In the US it would be] nowhere near the effect it would have in this country and in the rest of Europe for that matter," he said. In the UK, Williams added, emissions from diesel cars cause roughly 5,800 premature deaths each year. "If you were to make the cars emit at the legal limit you could reduce those deaths by at least a factor of two and maybe more. Maybe a factor of five."

The Clean Air in London campaign called for a royal commission to investigate carmaker's activities in the UK.

"Diesel is without doubt the biggest public health catastrophe in UK history. Even the black plague didn't affect everyone in the population," said founder Simon Birkett.

Not all NOx emissions – which include nitrogen dioxide (NO2) and nitrogen oxide (NO) – are dangerous. But an increasing proportion of the toxic NO2 gas has been detected in EU

diesel emissions. A study in the British Medical Journal in May found that short term exposure to NO2 increased the number of premature deaths from heart and lung disease by 0.88% and 1.09%.

For years, UK air pollution measurements have failed to show improvements in air quality, even as standards have tightened.

"Since 2003 scientists have been saying things are not right. It's not just the VW story, this is part of something much bigger," said Dr Gary Fuller, also of King's College. "It has a serious public health impact."

Last week, a report from NGO Transport & Environment found that Europe's testing regime was allowing nine out of every 10 new diesel vehicles to breach EU limits. Testing regimes in the EU are known to fail to pick up "real world" emissions because cars are not driven in the same way in the laboratory as on the road. Some studies suggest the discrepancy may be up to seven times the legal limit.

Williams said being able to mask their NOx emissions would also enable carmakers to pass carbon emissions tests more easily as there was a trade-off between NOx and CO2 in diesel engines.

Catherine Bearder MEP, a lead negotiator on the EU's new air quality laws, said: "Manufacturers in the US have been caught out, but we know that pollution limits are also being breached in Europe... Unless we take action, thousands of lives will continue to be tragically cut short by air pollution."

In a sign that the emissions scandal will not remain restricted to the US, a Venice court will next month hear a case against VW and Fiat for misleading test advertising.

The Italian consumer rights group Altroconsumo is due to press its case for a class action suit against VW and Fiat on 2 October, after laboratory tests showed that fuel consumption and CO2 emissions from the VW Golf 1.6 and Fiat Panda 1.2 were up to 50% higher than claimed.

Altroconsumo wants the German car firm to pay damages of €502 (£365) to the owner of a VW Golf, in a case that raises the possibility of widescale compensation payouts by the car industry.

Monique Goyens, the director of the European consumer rights umbrella group BEUC, which includes Altroconsumo, called for an investigation by the European Commission into the use of software programmes to 'game' European emissions tests.

"The VW scandal has compounded our concern that underhand tactics are also being used in fuel consumption and CO2 testing programmes in Europe," she said. "One of the problems in the EU, unlike in the US, is the absence of a market surveillance system which would require independent in-use conformity testing. The EU needs to implement such a

system to restore trust amongst consumers."

On Tuesday, the Italian government launched an investigation into VW's emissions testing regime.

VW Could Fool the EPA, But It Couldn't Trick Chemistry
Eric Niiler

FOR DECADES, AUTOMAKERS HAVE been caught between building an engine that squeezes a lot of energy out of the fuel it burns and one that has low emissions. It's not an easy tension to resolve. "Negotiating both fuel consumption and emissions is a hard tradeoff," says Anna Stefanopolou, professor of mechanical engineering at the University of Michigan.

When engineers at Volkswagen allegedly inserted a few lines of code into the diesel cars' electronic brains to circumvent emissions testing, they found a solution to this existential automotive conflict. Drivers got low emissions during the test, and high performance the rest of the time. The only problem: It's way outside of the rules. The company might have gotten away with it, too, if it hadn't been for those pesky engineers—and the basic chemistry of the diesel engine.

According to the US EPA, those lines of code hid the fact that nearly half a million diesel VWs in the US spewed up to 40 times more nitrogen oxide from their tailpipes than testing indicated. Volkswagen has now confirmed that the problem actually affects approximately 11 million diesel cars worldwide. Diesel engines use a different mix of fuel than gasoline engines and don't use spark plugs to induce combustion—relying instead on highly compressed, heated air and fuel injected as droplets. If a diesel engine doesn't get enough oxygen to combust the fuel, it'll emit all kinds of gunk—nitrogen oxides, uncombusted fuel, and particulate matter (soot, basically).

All that gunk is a big problem. Exposed to sunlight, nitrogen oxides convert to ozone—making smog. How much depends on a bunch of variables, like sunlight exposure and what happens to the hydrocarbon emissions (the uncombusted fuel), plus the temperature and local winds.

However much extra crap came from the VWs, it won't be good. Exposure to nitrogen oxide and ozone is linked to increased asthma attacks, respiratory illnesses, and in some cases premature death. Ozone also worsens existing cardiovascular and lung disease.

To deal with those emissions, "you have a whole chemical factory at the tailpipe that traps the oxides," Stefanopolou says. This bumps the sticker price for diesel cars by $5,000 to $8,000 per vehicle. (On the other hand, diesels get better mileage, especially in highway

driving.)

For years, diesel trucks and buses were the biggest polluters on the highway. But carmakers adapted a relatively new technology called selective catalytic reduction—the same tech that scrubs pollutants from factory smokestacks—to the tailpipe of the diesel engine.

Here's how it works: Inside a honeycombed chamber, the scrubbing system sprays a liquid made of 30 percent urea and 70 percent water into the diesel exhaust. This sets off a chemical reaction that converts nitrogen oxides into nitrogen, oxygen, water and small amounts of carbon dioxide—molecules that aren't as harmful to human health. Catalytic scrubbing was supposed to cut diesel NOx emissions up to 90 percent, according to the Diesel Technology Forum, an industry group based outside Washington. That made diesel engines clean enough to use in passenger cars, which have stricter emissions rules.

The scrubbing chemistry is also what gave away Volkswagen's alleged cover-up. In 2013, a small non-profit group decided to compare diesel emissions from European cars, which are notoriously high, with the US versions of the same vehicles. A team led by Drew Kodjak, executive director of the International Council on Clean Transportation, worked with emissions researchers at West Virginia University to test three four-cylinder 2.0-liter diesel cars in the Los Angeles area: a Jetta, a Passat, and a BMW. Only the BMW passed.

"We felt that it would be possible to get low emissions for diesels," Kodjak said. "You can imagine our surprise when we found two of the three vehicles had significant emissions."

The ICCT reported its findings to the EPA and the California Air Resources Board. Regulators met with VW officials in 2014 and the automaker agreed to fix the problem with a voluntary recall. But in July 2015, CARB did some follow up testing and again the cars failed—the scrubber technology was present, but off most of the time.

How this happened is pretty neat. Michigan's Stefanopolou says computer sensors monitored the steering column. Under normal driving conditions, the column oscillates as the driver negotiates turns. But during emissions testing, the wheels of the car move, but the steering wheel doesn't. That seems to have have been the signal for the "defeat device" to turn the catalytic scrubber up to full power, allowing the car to pass the test.

Stefanopolou believes the emissions testing trick that VW used probably isn't widespread in the automotive industry. Carmakers just don't have many diesels on the road. And now that number may go down even more.

IEEE Spectrum:
http://spectrum.ieee.org/cars-that-think/transportation/advanced-cars/how-professors-caught-vw-cheating

How Engineers at West Virginia University Caught VW Cheating
By Philip E. Ross

Volkswagen, which had just become the biggest-selling automaker in the world, has now been nabbed committing perhaps the biggest corporate cybercrime of all time.

Its diesel cars were found to have cheated systematically on emissions tests run by the United States Environmental Protection Agency (EPA) over the past seven years. When the control system sensed that a test was under way, it would order the engine to ix-nay on the ox-nay—NOx that is, or nitrous oxides—long the bugbear of diesel engines. Later, when the coast was clear, the system would let the NOx pour out at up to 40 times the allowed levels in order to optimize fuel economy.

This dirty trick allowed for a clean getaway for some 482,000 cars under the VW and Audi brand names, including the VW Jetta and the Audi A3. The EPA found out, VW admitted wrongdoing, and it stopped selling the offending vehicles. Its shares lost more than 0ne-fifth of their value in the early hours of the next trading day.

But the guys who found the clues to the crime say they weren't looking for trouble—they were just working under contract to a clean-transportation group that wanted to convince European regulators to adopt stricter emissions standards, as the United States has done.

"We had no cause for suspicion; we thought the vehicles would be clean," John German, of the International Council on Clean Transportation, told Bloomberg news.

The ICCT subcontracted the testing to the University of West Virginia's Center for Alternative Fuels, Engines and Emissions (CAFEE). Its engineers compared emissions measured on a road trip to results from the same cars that their colleagues were getting in the lab. The discrepancies were great.

Dan Corder, head of WVU's Center for Alternative Fuels, Engines, and Emissions (CAFEE)
Some people have mischaracterized what our role was," says Dan Corder, who heads up CAFEE. "Some have used the phrase 'tipped off the EPA.' We didn't."

The engineers from CAFEE reported on these preliminary results in spring of 2014 at the Coordinating Research Council's Real-World Emissions Workshop, which was held in San Diego that year. Corder hastens to add that the results, based as they were on a handful of cars, were preliminary and that they researchers drew no conclusions. According to Corder:

We said, these are two vehicles. We're presenting what we can present. EPA people were in the audience. And the ICCT publicized the results on its website, then delivered them to the EU's Joint Research Center.

Volkswagen Says 11 Million Cars Worldwide Are Affected in Diesel Deception
By JACK EWING SEPT. 22, 2015

FRANKFURT — A scandal that has undermined Volkswagen in the United States spread to its core market of Europe on Tuesday, after the company said that 11 million of its diesel cars worldwide were equipped with software that was used to cheat on emissions tests.

Volkswagen did not provide information on where the affected cars are, but the overwhelming majority are probably in Europe, where the company dominates the market and accounts for more than one of every four cars sold.

The German automaker said it was setting aside the equivalent of half a year's profits — 6.5 billion euros, or about $7.3 billion — to cover the cost of fixing the cars to comply with pollution standards and to cover other expenses, which are likely to include fines as well as responses to civil lawsuits from angry customers.

The carmaker's statement was its first admission that diesel cars outside the United States may contain the software that led the Environmental Protection Agency to accuse the company of deliberately evading pollution tests. Previously, Volkswagen had acknowledged only that the problem affected about 500,000 vehicles in the United States.

The tampered vehicles use what is known as Type EA 189 engines, which are 2-liter engines. The company said on Tuesday that "a noticeable deviation between bench-test results and actual road use was established" for the engines.

Volkswagen said it would also make "other efforts to win back the trust of our customers."

The number of cars involved suggests that the scale of the damage to Volkswagen's reputation and its financial standing may be even greater than thought.

Volkswagen shares fell by nearly 18 percent through late-afternoon trading in Frankfurt on Tuesday, after falling by 16 percent on Monday.

The diesel cars were programmed to sense when emissions were being tested and to turn on equipment that reduced emissions, according to United States officials. At other times, the cars had better fuel economy and performance, but produced as much as 40 times the allowed amount of nitrogen oxide, a pollutant that can contribute to respiratory problems including asthma, bronchitis and emphysema.

"Volkswagen is working intensely to eliminate these deviations through technical measures," the company said.

It is not clear, though, how fully Volkswagen might be able to correct the problem on the 11 million vehicles. The company could presumably alter the engines, so that the cars on the road begin actually meeting the required emissions standards. But doing so would probably degrade the vehicles' fuel economy and performance, and might cause the engines to wear out sooner.

The E.P.A. has ordered Volkswagen to recall almost a half-million vehicles sold in the United States from 2009 to 2015. The affected Golf, Passat, Jetta and Beetle cars were equipped with 2-liter diesel engines. Some Audi models also use the same diesel engine.

Volkswagen has halted sales of cars with the engines in the United States.

Volkswagen CEO's days appear numbered as emissions crisis deepens
BERLIN | BY ANDREAS CREMER

Martin Winterkorn's days as head of Volkswagen AG appeared numbered on Tuesday after the German carmaker said a scandal over falsified vehicle emission tests in the United States could affect 11 million of its cars worldwide.

The Tagesspiegel newspaper, citing unidentified sources on Volkswagen's supervisory board, said the board would decide on Friday to replace Winterkorn with Matthias Mueller, the head of the automaker's Porsche sports car business.

A Volkswagen spokesman denied the report. The company later said it would post a video statement by Winterkorn at 1500 GMT. A spokesman for Porsche said Mueller was attending a Volkswagen board meeting at its headquarters in Wolfsburg.

A key Winterkorn ally withheld public support for the under-fire chief executive on Tuesday.

"I don't want to preempt the upcoming intense deliberations and will not comment on details or any consequences," Stephan Weil, head of the German state of Lower Saxony, told reporters in Hanover when asked about Winterkorn's future.

Weil, a supervisory board member representing Volkswagen's second-largest shareholder, earlier this year helped Winterkorn to see off a challenge to his leadership by long-time chairman Ferdinand Piech.

Shares in Europe's biggest carmaker plunged almost 20 percent on Monday after it admitted

using software that deceived U.S. regulators measuring toxic emissions in some of its diesel cars.

The stock tumbled another 20 percent to a four-year low on Tuesday after some countries in Europe and Asia said they would launch investigations themselves.

Volkswagen said it would set aside 6.5 billion euros ($7.3 billion) in its third-quarter accounts to help cover the costs of the biggest scandal in its 78-year-history, blowing a hole in analysts' profit forecasts.

It also warned that sum could rise, adding diesel cars with so-called Type EA 189 engines built into about 11 million Volkswagen models worldwide had shown a "noticeable deviation" in emission levels between testing and road use.

Volkswagen sold 10.1 million cars in the whole of 2014.

The U.S. Environmental Protection Agency (EPA) said on Friday Volkswagen could face penalties of up to $18 billion for cheating emissions tests. The carmaker also faces lawsuits and damage to its reputation that could hit sales, while media reports have said the U.S. Department of Justice has opened a criminal inquiry into the matter.

The crisis has sent shockwaves through Germany, with Chancellor Angela Merkel calling for "complete transparency" from a company long seen as a beacon of the country's engineering excellence, and newspapers putting the blame squarely on Winterkorn.

The 68-year-old was due to have his contract extended at a supervisory board meeting on Friday, but is now facing questions over why the scandal wasn't averted.

Volkswagen, which for several years has been airing U.S. TV commercials lauding its "clean diesel" cars, was challenged by authorities as far back as 2014 over tests showing emissions exceeded California state and U.S. federal limits.

The company attributed the excess emissions to "various technical issues" and "unexpected" real-world conditions.

It wasn't until the EPA and the California Air Resources Board threatened to withhold certification for its 2016 diesel models that Volkswagen in early September admitted its wrongdoing.

"Winterkorn either knew of proceedings in the U.S. or it was not reported to him," Evercore ISI analyst Arndt Ellinghorst said. "In the first instance, he must step down immediately. In the second, one needs to ask why such a far-reaching violation was not reported to the top and then things will get tough too."

Porsche's Mueller was promoted to Volkswagen's executive board on March 1 and was previously its head product strategist. As a management board member of family-owned

Porsche SE, he is also close to the Porsche-Piech clan that has a controlling shareholding in Volkswagen.

"TOTALLY SCREWED UP"

Winterkorn has built Volkswagen into a global powerhouse since he took the helm in 2007, with brands ranging from budget Seats and Skodas to premium Audis and top-end Porsches and Lamborghinis.

But he has also faced criticism for a centralized management style which some analysts say has hampered the company's efforts to address long-standing underperformance in North America.

Workers in Wolfsburg, where Volkswagen employs over 50,000 people, were dismayed by the damage to the company's image. "If Winterkorn knew of the manipulation, then he must go," said one staffer who works at the plant's human resources department.

LA Times:
http://www.latimes.com/business/autos/la-fi-vw-subsidies-20150922-story.html

U.S. taxpayers duped into shelling out $51 million in green subsidies for 'clean' VW vehicles
By JERRY HIRSCH

The federal government paid out as much as $51 million in green car subsidies for Volkswagen diesel vehicles based on falsified pollution test results, according to a Times analysis of the federal incentives.

On Friday, federal and state regulators said the German automaker used software in 482,000 of its diesel vehicles since the 2009 model year to cheat on U.S. emissions tests. Environmental Protection Agency officials said Monday that the U.S. Department of Justice is also investigating.

The Times analysis matched Internal Revenue Service data with Volkswagen sales figures to determine the value of subsidies VW diesel buyers were eligible to collect in 2009, the first and only year the vehicles qualified. The $1,300 tax credit would have been available to buyers of about 39,500 Jetta and Jetta Sportwagen models that sold that year, according to Motor Intelligence, an industry research firm.

"It is really unfortunate," said Luke Tonachel, director of clean vehicles and fuels project at the Natural Resources Defense Council. "The government has been effective to help advance clean technologies, but it is a waste of taxpayer dollars when they aren't actually helping to clean the environment."

He said regulators should factor in the $51 million in subsidies when determining penalties for Volkswagen's Clean Air Act violations.

Such green car incentives have also gone to buyers of hybrid, electric and hydrogen fuel cell cars. But the EPA does not track aggregate figures for incentives paid out to buyers of specific models or brands.

The Volkswagen diesels qualified for the federal incentives in the same year the automaker first installed the software trick it used to cheat on emissions tests. The so-called defeat device employed an algorithm that automatically detects when the vehicle is undergoing pollution tests and changes the way the engine performs.

The algorithm senses whether the car is in a testing environment by analyzing a variety of data — steering position, speed, duration of engine operation and barometric pressure.

Away from the laboratory, during everyday driving, the cars emit up to 40 times the legally allowed amount of nitrogen oxide, environmental officials said.

The Environmental Protection Agency and the California Air Resources Board discovered the software. The EPA said Monday it will coordinate with federal prosecutors on further enforcement and penalties.

How Volkswagen cheated on emissions rules
Autos editor Brian Thevenot explains how Volkswagen used a software trick to hide illegal pollution levels in half a million diesel cars.

"Determinations regarding potential penalties and other remedies will be assessed as part of the investigation EPA has opened in conjunction with the U.S. Department of Justice," said EPA spokeswoman Liz Purchia.

The Justice Department has lately taken on a leading role in major investigations of automakers, usually leveraging the threat of criminal charges to exact huge fines.

Last week, General Motors agreed to pay a $900-million fine to settle an investigation into why it did not promptly recall cars with a defective ignition switch that has led to crashes causing 124 deaths. Last year Toyota signed a $1.2-billion settlement and admitted to deceiving regulators about deadly safety defects that allegedly caused unintended sudden-acceleration incidents.

No individuals were charged in the GM and Toyota probes.

"This might be the perfect case for Department of Justice to come down on the criminal side against individuals and not just the company," said Carl Tobias, a University of Richmond law professor. "Someone had to do the computer programming. Someone had to OK this, and all in what is known as an autocratic, top-down company."

The German automaker admitted installing the software after it was confronted by regulators. In a statement Sunday, VW Chief Executive Martin Winterkorn said, "I personally am deeply sorry that we have broken the trust of our customers and the public."

Winterkorn said the automaker "will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly and completely establish all of the facts of this case."

He said VW has also ordered an external investigation into the matter, pledging to "do everything necessary in order to reverse the damage this has caused."

Volkswagen declined to comment on the Times analysis of its revenue from the federal Alternative Motor Vehicle Credit.

Volkswagen shares fell $33.89, or 18.5%, to close Monday at $149.68.

See the most-read stories this hour >>
This was the second time Volkswagen has been charged with using devices to evade U.S. emission-control rules.

In 1974, the automaker paid a $120,000 fine to settle EPA charges that it gamed pollution control systems in four models by changing carburetor settings and shutting off an emissions-control system at low temperatures. VW didn't admit guilt but pledged management changes to ensure future compliance with EPA regulations.

This time the monetary damage could be much greater.

The automaker will have to recall all the vehicles and modify the emissions systems at its own expense, regulators said. Additionally it could face a fine of as much as $18 billion, or $37,500 per car. And for now it has suspended sales of thousands of new and used diesel models sitting on dealer lots — cars that are depreciating rapidly while the automaker develops a fix for the emissions system.

The affected diesel models are Jetta (model years 2009-15), Beetle (2009-15), Audi A3 (2009-15), Golf (2009-15) and Passat (2012-15).

Volkswagen also will face civil lawsuits on two fronts, including consumer fraud cases and class-action litigation for what is called a "diminished value" lawsuit. The vehicles are likely to lose some of their resale value because of the problem.

The Volkswagen case breaks new ground for how corporations can make "end runs" around legal requirements, said Ryan Calo, a University of Washington professor and expert in robotics and autonomous systems law and policy.

A company, for example, might learn of an inspection at a construction site and then make sure that workers wear helmets or it might clean a food plant thoroughly before a scheduled review even if it doesn't operate that way all the time.

"But this is encoded," Calo said. "I bet that it happens elsewhere but it is rare we detect it because we typically don't go through the code. There could be many examples in everyday things."

The VW issue demonstrates why regulators need more technical expertise, including a federal robotics commission, he said.

"We need experts in a centralized place whether the issues are drones, driverless cars or things like the VW example," Calo said.

EPA is 'Upping its Game' After Volkswagen Allegations
Top administrator is pleased with auto maker's 'aggressive stance' on tackling problem
By JEFFREY SPARSHOTT
Sept. 22, 2015 9:42 a.m. ET

WASHINGTON—The top official at the Environmental Protection Agency said the agency is "upping its game" in the search for possible violations of U.S. pollution rules following allegations that Volkswagen AG circumvented emissions standards.

"We are not going to sit around and worry about whether others have it, we are going to find it," Gina McCarthy said at a Wall Street Journal breakfast Tuesday. "Right now, we are upping our game in terms of going out and doing work to take a look at what we need to do with other vehicles."

The EPA last week accused Volkswagen of dodging air-pollution rules on nearly half a million cars sold in the U.S. The German company has since halted American sales of the diesel-powered cars at issue and apologized for violating customers' trust.

Volkswagen allegedly used software, dubbed a "defeat device," in the cars to make diesel-powered engines appear to have lower levels of emissions than they actually did. About 482,000 Volkswagen diesel-powered cars sold in the U.S. since 2008 were affected.

Ms. McCarthy said the alleged violation was difficult to detect, but she is "pleased Volkswagen is taking such an aggressive stance on admitting the problem and attacking it."

"I think we have to be concerned whether there are other defeat devices out there that we have not been able to detect," she said. But the auto industry is well aware of the pollution rules and has been working to comply.

"I think it will be very difficult for Volkswagen at this point to be looked at as nothing other than an outlier," Ms. McCarthy said.

Detroit Free Press:
http://www.freep.com/story/news/2015/09/21/us-house-panel-hold-hearing-vw/72583066/

Congress to hold hearing on VW air emissions violation
Todd Spangler and Nathan Bomey, Detroit Free Press and USA Today 8:15 p.m. EDT September 21, 2015

WASHINGTON — Congressional investigators will hold a hearing in the coming weeks to take testimony on allegations raised by the U.S. Environmental Protection Agency that Volkswagen sold hundreds of thousands of diesel-powered vehicles with software to get around air emission limits.

U.S. Rep. Fred Upton, who chairs the House Energy and Commerce Committee, said Monday that the committee's Oversight and Investigations Subcommittee will look into the EPA's allegations, which were first raised Friday. VW's stock value plunged Monday in the aftermath of the revelations, which could affect some 500,000 vehicles and potentially result in fines totaling as much as $18 billion.

Volkswagen's CEO said he was "deeply sorry" for violating U.S. emissions standards and on Sunday ordered an external investigation, two days after the EPA accused the automaker of purposefully manipulating emissions tests for almost 500,000 vehicles.

The German automaker ordered its U.S. dealerships to stop selling cars impacted by the probe until its engineers can deliver a fix.

A date was not set for the congressional hearing but Energy and Commerce staff said it would come within the next several weeks.

"Strong emissions standards are in place for the benefit of public health," Upton, R-St. Joseph, and subcommittee Chairman Tim Murphy, R-Pa., said in a joint statement. "We will

follow the facts. We are ... concerned that auto consumers may have been deceived — that what they were purchasing did not come as advertised."

As the Free Press reported Friday, the EPA and the state of California accused VW of violating the Clean Air Act by using software in some 482,000 diesel-powered vehicles that could detect when the car was undergoing official emissions testing and turn full emissions controls on only during the test. The effectiveness of pollution control equipment was reduced otherwise.

EPA's violation notice covered model year 2009-15 Jettas, Beetles, Audi A3s and Golfs and model year 2014-15 Passats.

As a result, Volkswagen had a hand in potentially exposing people to harmful pollutants at levels 40 times the acceptable standard and that could exacerbate respiratory conditions such as asthma, the EPA charges.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Martin Winterkorn, Volkswagen's CEO, said in a statement. "We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly and completely establish all of the facts of this case."

"We do not and will not tolerate violations of any kind of our internal rules or of the law," Winterkorn said. The company's board takes the allegations "very seriously," he said.

The violations could expose Volkswagen — the world's largest vehicle manufacturer through the first six months of 2015 — to up to $18 billion in federal fines if the EPA assesses the maximum possible penalty of $37,500 per vehicle.

The violations could invite charges of false marketing by regulators, a vehicle recall and payment to car owners, either voluntarily or through lawsuits. Volkswagen advertised the cars under the "Clean Diesel" moniker.

The state of California is investigating the emissions violations.

The EPA accused the German automaker of adopting what it called a "defeat device" to trick U.S. regulators into believing its cars met Clean Air Act standards for nitrogen oxides. Volkswagen admitted to investigators it had installed the defeat device, the EPA said.

Volkswagen told dealers they cannot sell the 4-cylinder diesel versions of those cars until a fix is available, Volkswagen spokesman Mario Guerreiro said Sunday.

The sales halt could put a significant dent in the company's September sales performance. About 20% of Volkswagen's vehicle sales are diesel engines, said AutoPacific analyst Dave Sullivan.

"It totally goes against all of the marketing they have had of a clean diesel," Sullivan said of

the violations. "That's one of the biggest selling points for Volkswagen."

"The trust of our customers and the public is and continues to be our most important asset," Winterkorn said Sunday. "We at Volkswagen will do everything that must be done in order to re-establish the trust that so many people have placed in us, and we will do everything necessary in order to reverse the damage this has caused. This matter has first priority for me, personally, and for our entire Board of Management."

Chicago Tribune:
http://www.chicagotribune.com/business/ct-volkswagen-owners-0921-biz-20150921-story.html

Volkswagen owners should be nervous about emissions scandal, experts say
Becky Yerak and Gregory Karp

Volkswagen hit with class-action suit over emissions cheating.
Automobile recalls, even huge, highly publicized ones, typically don't hurt new or used car sales, but the Volkswagen scandal involving tricking emissions testers is different and could be cause for worry among VW diesel vehicle owners, experts say.

At least one class-action lawsuit has already been filed on behalf of Volkswagen and Audi owners. It claims fraud and breach of contract, citing the "diminished value" of the nearly 500,000 recalled diesel vehicles, which usually sell for a premium price over their gasoline counterparts. Specifically, after recalled Volkswagen diesels are fixed, the cars might have degraded horsepower and fuel efficiency, the suit says.

The EPA says Volkswagen violated the federal Clean Air Act by installing "defeat devices" — software programmed to switch engines to a cleaner mode during official emissions testing. The software then switches off again, enabling cars to emit as much as 40 times the legal limit of pollutants during normal driving.

Volkswagen marketed the diesel-powered cars as being better for the environment. The affected diesel cars, according to the EPA's letter to Volkswagen on Friday, include: Jetta, 2009 to 2015; Jetta SportWagen TDI, 2009 to 2014; Beetle, 2012 to 2015; Beetle Convertible, 2013 to 2015; Audi A3, 2010 to 2015; Golf, 2010 to 2015; Golf SportWagen TDI, 2015; and Passat, 2012 to 2015.

Consumer Reports called the Volkswagen scandal "outrageous" and a violation of law.

"Volkswagen was ripping off the consumer and hurting the environment at the same time," said Ellen Bloom, senior director of federal policy for Consumers Union, the policy and advocacy arm of Consumer Reports.

The EPA has ordered VW to fix the cars at its own expense but said car owners do not need to take any immediate action. The EPA insisted that the violations do not pose any safety

hazard and said cars on the road remain legal to drive. Volkswagen has ordered a stop to sales of new and used TDI cars in stock.

The EPA said, however, that the cars pose a threat to public health. The agency said the carmaker could be fined more than $18 billion.

The automaker is also part of a criminal probe by the U.S. Justice Department, unnamed sources told The Associated Press and Bloomberg News.

In the Chicago region, Volkswagen dealerships were not responding to inquiries Monday, except one that said it hadn't heard from any consumers about the issue and expressed confidence the problem would be taken care of.

For consumers, whether diesel Volkswagens from seven model years will really have less value is an open question.

During recent high-profile recalls by GM, Toyota and Honda, there has been very little, if any, impact on sales, said officials from Kelley Blue Book, Black Book and Edmunds.

"With so many recalls in the news, they easily become white noise for a lot of consumers, and they don't appear to have much of an influence on shopping decisions," according to Edmunds.com.

Even when there's intense media coverage, the impact on resale value is "fleeting," as with the Toyota recall for accelerators that would stick, said Eric Ibara, a senior analyst with Kelley Blue Book. "It lasted for maybe six or eight months, and their resale values popped back to where they normally were.

Still, the Volkswagen recall is different.

First, it doesn't involve a safety issue but more a breach of public trust. "The impact on that could be longer-lasting," Ibara said. "Our concern is their image is tarnished ... I imagine if you own a Volkswagen, you're reading the coverage of what they've done."

Indeed, when a car is recalled for a safety reason, the recall could actually improve goodwill with the customer, said Anil Goyal, vice president of Automotive Valuation and Analytics for Black Book.

Another concern for current owners is how the resale values will react when Volkswagen eventually restarts selling the diesel models now sitting idle on lots after it stopped selling. "If they show up with higher incentive levels, that certainly impacts the used-car values," Ibara said.

In other words, if VW chooses to get rid of that inventory by offering great incentives and significantly lowering diesel car prices, demand for used cars would drop along with their prices.

Volkswagen offers some of the least expensive diesel models and in recent years had been a market leader in that segment of the vehicle market, said John Voelcker, editor of GreenCarReports.com. "Diesels in this country have mostly been confined to trucks," Voelcker said. "VW was the only volume maker of diesel cars."

According to Edmunds, VW and Audi account for 17 of 44 vehicle models that offer diesel engines, or 39 percent.

Diesel vehicles fetch a premium price both in the new and used markets. The premium price paid by new-car buyers for the diesel version of the recalled cars varies from $1,000 to almost $7,000, according to list prices.

In a quick analysis by Swapalease.com, a 3-year-old base model Volkswagen Golf using gasoline sold for 51 percent of its original value, while a diesel sold for 57 percent, said Scot Hall, executive vice president of operations for Swapalease.com. "That's a significant difference," he said.

It's an open question whether the VW diesels, which have TDI as part of the name for turbocharged direct injection, will retain the premium over their gasoline counterparts, Ibara said. "It would not surprise me if they drop a little bit, but I do not expect the premium to entirely disappear."

What fix Volkswagen will employ is unclear, whether it's a software solution or some physical repair or retrofit. It may just restate the fuel economy to be lower on diesels — maybe 3 to 5 mpg — and then be faced with offering some compensation to owners, Ibara said.

So far, it's difficult to say for sure that a fix would hurt the vehicle's fuel mileage, performance or reliability. But some current owners are expecting that, Hall said.

Hall said there's talk that some Volkswagen owners would avoid the fix because they prefer more power, better performance and greater fuel economy and care less about the emissions.

Consumer Reports said that, as a result of the scandal, it has suspended its "recommended" rating of two VW vehicles, the Jetta diesel and Passat diesel, until it can retest the cars with the recall repair performed. It said it will also assess whether the repair hurts performance or fuel economy.

The potential downgrade in performance was also mentioned in the class-action lawsuit,

filed on behalf of David Fiol, a California resident and 2012 VW Jetta SportWagen TDI owner. He seeks class-action status both nationally and in California, for unspecified punitive damages and legal fees, among other things.

Fiol, in his lawsuit, mentions "future additional fuel costs" and the "diminished value" of his vehicle, despite the recall.

Volkswagen won't be able to make the vehicles "comply with emissions standards without substantially degrading their performance characteristics, including their horsepower and their efficiency," the lawsuit said. "As a result, even if Volkswagen is able to make" plaintiffs' vehicles EPA compliant, the owners "will nonetheless suffer actual harm and damages because their vehicles will no longer perform as they did when purchased and as advertised."

Volkswagen didn't immediately respond to a request for comment about the lawsuit, filed last Friday by Seattle law firm Hagens Berman Sobol Shapiro in a U.S. District Court in the Northern District of California.

In Illinois, diesel vehicles like the VWs in question don't require emissions inspections like gasoline models, so the flap won't affect owners in that way, according to a spokeswoman for the Illinois Environmental Protection Agency.

It Took E.P.A. Pressure to Get VW to Admit Fault
By BILL VLASIC and AARON M. KESSLER SEPT. 21, 2015

Volkswagen executives told environmental regulators for more than a year that discrepancies between pollution tests on its diesel cars and the starkly higher levels out on the road were a technical error, not a deliberate attempt to deceive Washington officials.

But this month, the executives made a startling admission: The diesel vehicles it sold in the United States used software meant to cheat on the tests.

VW made the admission only when the Environmental Protection Agency took the extraordinary action of threatening to withhold approval for the company's 2016 Volkswagen and Audi diesel models, according to letters sent to company officials by the E.P.A. and California regulators.

Since that deception became public on Friday, Volkswagen has scrambled to conduct

damage control. The chief executive apologized and the company said it would stop selling diesel-powered cars from the 2015 and 2016 model years.

All this was possible because environmental regulators had tools and powers at their disposal that another area of enforcement — auto safety regulation — does not have, despite the efforts of lawmakers, consumer advocates and, more recently, auto safety regulators themselves. Often, the auto industry has beaten back more stringent laws.

The National Highway Traffic Safety Administration, for example, can impose a maximum penalty of $35 million on an automaker that flouts safety regulations — a relatively low sum for a company like General Motors, which last year paid such a fine for a defect that has now been linked to at least 124 deaths.

By contrast, under the Clean Air Act, Volkswagen, the world's largest automaker, could be fined as much as $37,500 for each recalled vehicle, for a possible total penalty of as much as $18 billion.

"The Clean Air Act statutory scheme gives E.P.A. more power and flexibility to move more quickly than N.H.T.S.A.," said Carl Tobias, a law professor at the University of Richmond, who has studied the government's response to auto safety issues. "E.P.A. also seems more tough-minded and savvy about how to be effective in this arena."

Still, the time it takes to investigate auto companies is often extensive, and getting the facts can be a challenge. "Even E.P.A. took a year to finally crack this case open," he said.

Beyond the E.P.A., the government has other tools at its disposal when it comes to enforcing environmental regulation.

As G.M. did, Volkswagen now faces a criminal investigation by the Justice Department, according to a person briefed on the inquiry. It is being conducted, though, by the department's Environment and Natural Resources Division, which is devoted to violations of environmental law. "Nearly one-half of the division's lawyers bring cases against those who violate the nation's civil and criminal pollution-control laws," the department's website says.

And on Monday, a subcommittee of the House Energy and Commerce Committee said it would hold a hearing on the issue.

It's only part of the pressure being applied to Volkswagen. An official with the Environmental Protection Agency said that discussions are continuing with Volkswagen, as the company grapples with how to handle a recall of the affected vehicles.

"We still have many questions for the company," said Christopher Grundler, head of the agency's transportation office. "It's the responsibility of Volkswagen and Audi to prepare a remedy for these vehicles."

There is no timetable for Volkswagen to submit a comprehensive plan to recall and fix the affected vehicles. But government officials are urging the company to take action quickly — both on developing a fix for the cars and starting a campaign to educate consumers on the problem.

"This does not happen immediately," Mr. Grundler said. "And we've been trying to be clear with the consumers that their vehicles are safe and they don't have to do anything right now." The assessment of fines for the violations will also not happen immediately. "That is down the road," he said.

"But we feel a sense of urgency to address the emissions of these vehicles that are already on the road."

A Volkswagen spokesman, John Schilling, said the automaker was "committed to fixing this issue as soon as possible" and to developing "a remedy that meets emissions standards and satisfies our loyal and valued customers."

Even with the looming punishment, the company almost got away with it. In fact, it most likely would have if not for a strange twist of fate and the curiosity of several auto researchers.

Two years ago, the International Council on Clean Transportation, a nonprofit environmental group staffed by a number of former E.P.A. officials, had been testing the real-world performance of so-called clean diesel cars in Europe, and were less than impressed with the emissions results.

The group decided it would test diesel-powered cars in the United States, where regulations were much more strict, as a way of almost shaming the European automakers to tighten their compliance. The group fully expected the American cars to do well, and run cleaner than their counterparts across the pond.

What they could not have foreseen was that they would stumble onto one of the biggest frauds in recent automotive history.

Further, on the campus of West Virginia University, a group of emissions researchers who mainly dealt with heavy trucks noticed an unusual posting by the transportation council, which was looking for a partner to test diesel-powered cars.

"No one had done that before in the U.S.," said Arvind Thiruvengadam, a professor at the university. "It sounded very interesting, to test light-duty diesel vehicles in real-world conditions. We looked around at each other said, 'Let's do it.' "

The university's team bid on the project and got the contract. Mr. Thiruvengadam and his colleagues never envisioned where it would lead. "We certainly didn't have an aim of catching a manufacturer cheating," he said. "It didn't even cross our minds."

The study also did not target Volkswagen specifically. It was something of a fluke, he said, that two out of three diesel vehicles bought for the testing were VWs.

It did not take long for suspicions to set in. The West Virginia researchers were well-versed in diesel performance on real roads, and had certain expectations for how the test cars should ebb and flow in their emissions. But the two Volkswagens behaved strangely.

"If you're idling in traffic for three hours in L.A. traffic, we know a car is not in its sweet spot for good emissions results," Mr. Thiruvengadam said. "But when you're going at highway speed at 70 miles an hour, everything should really work properly. The emissions should come down. But the Volkswagens didn't come down."

Even then, however, it is difficult for most researchers to be sure exactly what is going on. There are so many factors involved in real-world driving — speed, temperature, topography, braking habits. It is not unheard-of for cars to perform much differently in on-the-road tests than one expected.

But this time there was a key difference: The California Air Resources Board heard about the groups' tests and signed on to participate. The regulators tested the same vehicles in their specially equipped lab used to judge cars' compliance with state emissions standards. That gave the project what most studies lacked: a baseline.

"That broke loose everything," Mr. Thiruvengadam said.

In the lab, the two VWs performed flawlessly. But when they were taken out on the roads in California, they were belching out levels of nitrogen oxide that were 30 to 40 times higher than the regulatory standards. Even the heavy-duty trucks the researchers had tested had never performed that poorly by comparison.

"It just didn't make sense," said John German, one of the leaders on the project at the transportation council. "That was the real red flag for us."

Volkswagen Credit Spreads Soar After EPA Charges Co. With Evading Pollution Controls
John Atkins, CONTRIBUTOR

Credit spreads referencing German automaker Volkswagen widened sharply today after the U.S. Environmental Protection Agency on Friday charged the company with evading government pollution controls through software designed to allow diesel models to meet clean-air standards, but only during official emissions testing. The government demand for recalls affects roughly 500,000 vehicles.

Volkswagen five-year CDS costs increased 80% today, rising 60 bps to the 135 bps area, or a high since 2012, trade data show. The 2.45% notes due Nov. 20, 2019 issued by subsidiary Volkswagen Group of America Finance last November, at T+85, changed hands today as much as 77 bps wider on the session, reaching at G-spread equivalents as wide as T+180, according to MarketAxess.

Credit analysts today noted the significant potential risks to VW's credit standing and reputation. "VW's operating margins have lagged peers (BMW, Daimler) for some time, and the automaker has cited encouraging U.S. vehicle sales in the context of its 2015 revenue and profit outlook," stated FTN Financial senior credit strategist Benjamin Millard in a credit note.

While it acknowledged uncertainties regarding the impact of the scandal on Volkswagen's brand image and reputation – and terming the development a "crisis" for VW – Fitch today said the scandal is unlikely to trigger an immediate downgrade of Volkswagen's A rating, even though Volkswagen reportedly faces a maximum penalty of $18 billion as well as any costs related to a recall effort.

"We believe the fine is unlikely to amount to the theoretical maximum amount of USD37,500 per car, although there have been only very few precedents of such cases and associated fines. In addition, the group's financial structure is sound and its free cash flow (FCF) generation extremely robust," Fitch stated today.

The outlooks on the respective A/A2 ratings at S&P and Moody's are currently stable, through S&P warned as recently as Sept. 7 that stricter carbon rules were fueling high capital spending demands on Europe's carmakers.

The Volkswagen Diesel Emissions Scandal, By the Numbers
Ethan Wolff-Mann @ewolffmann Sept. 21, 2015

VW is accused of faking pollution tests on a grand scale.

Last week, the EPA accused Volkswagen of deliberately falsifying tests of its diesel engine cars so that the vehicles would pass anti-pollution standards. A massive recall of nearly half a million Volkswagen diesel cars was ordered, causing a major stir in the industry—and especially among VW owners who had been drawn to the vehicles because of the automaker's "clean diesel" claims.

Let's look at the situation by the numbers.

482,000 Diesel cars affected, which include TDI Jettas, Beetles, Golfs, and Audi A3s from 2009-15 and Passats from 2014-15.

$37,500 Fine per vehicle that the German automaker could face in the U.S.

$18 billion Possible total penalties faced by Volkswagen, and that figure doesn't include fixing the recalled cars.

40 Times over the legal limit of certain types of pollution emitted by the vehicles, including nitrogen oxide—which can cause respiratory problems.

$6,855 Premium that buyers were paying for Passat TDI cars over standard gasoline versions.

-20% The hit Volkswagen stock has taken since the scandal.

12 Number of months Volkswagen has been denying cheating on the emissions test.

2017 When Volkswagen may sell diesel cars again in the U.S., now that sales have been halted.

2.0 Liter 4-cylinder engines affected. Larger diesel engines used in SUVs don't have the software at the center of the controversy.

$0 Current resale value of affected cars in California, because the cars were sold as "non-compliant" (and therefore cannot be resold).

14.28% Of affected cars that are registered in California

23 Percentage of Volkwagens sold in August that were diesels.

Automotive News:

VW's diesel sales frozen until compliance is proven, EPA official says
Fix must be approved before recall can begin
Chris Grundler: "It will take more work to determine what the appropriate remedy for these vehicles is."
By Ryan Beene

WASHINGTON -- With its diesel car lineup grounded by an emissions-test cheating scandal, Volkswagen now bears the burden of proving that these vehicles comply with federal emissions standards, the EPA's top auto regulator said.

Until then, said Chris Grundler, director of the EPA's Office of Transportation Air Quality, no sales.

Meanwhile, Grundler said, the EPA and California regulators are now probing all light-duty diesel vehicles in the U.S. market from all manufacturers to check for illegal software designed to fool U.S. emissions tests.

U.S. regulators accused VW on Friday of violating the Clean Air Act by selling 482,000 diesel-powered vehicles with such illegal software. The agency said the company admitted to fitting seven model years' worth of diesel cars with the softwared -- termed a "defeat device" -- that would activate the cars' emission controls during testing, but deactivate them in real-world driving.

In order to be able to resume sales of diesels, Grundler said, VW has to engineer a fix to bring those vehicles into compliance, and receive EPA approval before a recall can commence. It's not clear yet whether that fix will consist of a change to the engine's emission control software or more substantial engineering changes to vehicle hardware, Grundler said.

According to the EPA's website, it could take up to one year to identify "corrective actions," develop a recall plan and issue recall notices. But Grundler declined to discuss a specific timetable.

"Until we gather that information and are convinced ... we're not going to go forward with the recall," Grundler said. "It will take more work to determine what the appropriate remedy for these vehicles is."

Capitol Hill
U.S. lawmakers want more answers, too.

Republican leaders of the House Energy and Commerce Committee today announced plans to hold a hearing on the VW emissions scandal in the near future. The hearing will be held before the panel's Oversight and Investigations Subcommittee, though no date has been set.

"We will follow the facts. We are also concerned that auto consumers may have been deceived – that what they were purchasing did not come as advertised," U.S. Reps. Fred Upton, R-Mich., and chairman of the Energy and Commerce Committee and Tim Murphy, R-Pa., chairman of the investigations subcommittee, said in a joint statement.

"The American people deserve answers and assurances that this will not happen again. We intend to get those answers."

Also in Washington, the White House said today it was "quite concerned" about reports it was seeing concerning VW's conduct in complying with U.S. Clean Air Act requirements.

"It's fair to say that we're quite concerned by some of the reports that we've seen about the conduct of this particular company, but ultimately this is the responsibility of the EPA to take a look at it and that's exactly what they're doing," said White House spokesman Josh

Earnest.

California questions
VW will also have to convince the EPA and California's Air Resources Board that its 2016 model year diesel vehicles will comply with emissions standards and are free of any illegal software, Grundler said. Until then, the agency will continue to withhold the emission certifications needed to begin sales of those models, which are currently being withheld from dealers.

The sales suspensions are a blow to Volkswagen, which counts on diesels for more than one-fifth of the VW brand's sales volume, and has touted its "clean diesel" technology as a key differentiator in the marketplace.

"We've been working with the company for a long time trying to get answers and it wasn't until very recently that VW admitted that these vehicles contained software designed to defeat the emissions standards," Grundler said. "We want to make sure that 2016 model vehicles don't operate the same way."

Popular Mechanics:
http://www.popularmechanics.com/cars/a17430/ezra-dyer-volkswagen-diesel-controversy/

This VW Diesel Scandal Is Much Worse Than a Recall
This isn't cost-cutting. This is outright cynical deceit.
By Ezra Dyer

Most of the time, media test cars are distinguished only by a license plate that might bear a discreet "manufacturer" tag. Audi diesels, though, are a different matter. Whether a Q7 or an A3, the diesel press cars from Audi (which is part of the Volkswagen group) always bear towering "TDI Clean Diesel" decals across their flanks. I guess the theory is that when the cars are out on the road they're serving double duty as billboards, spreading the gospel about the Volkswagen group's engineering prowess.

A few years ago I bought a nasty Ford F350 diesel for an engine swap, and I parked it next to an Audi A3 and took a few shots to capture the juxtaposition: truck from the dirty diesel past, Audi harkening to the clean-burning future. That certainly looks ironic today.

If you're not up to speed on Volkswagen's shenanigans, you can catch up here. Suffice to say that it seems the A3's sanctimonious TDI Clean Diesel stickers were relevant only when the cars were actually undergoing an EPA emissions test. Out in the real world, 2.0-liter Volkswagens and Audis were as much as 40 times above the legal emissions limit for nitrogen oxides (NOx). According to the EPA, about 482,000 four-cylinder Volkswagens and Audis built since 2009 included what the agency defines as a "defeat device," which is really just software that detects an emissions test and "turns full emissions controls on only during the test." The cheater software was discovered by researchers at West Virginia University who were trying to document the cleanliness of modern diesels. Volkswagen

surely wishes they hadn't bothered.

The revelation of this emissions subterfuge answers at least two questions about VW's mighty little diesel. The first concerns urea injection, which every other modern diesel uses to pass emissions tests. The urea-injection systems help to neutralize NOx emissions, but they also add weight and cost to the car, and saddle car buyers with yet another tank of liquid that must be monitored. If you run out of this diesel exhaust fluid, it's like running out of fuel—on trucks with such systems, running dry on urea triggers a severe limp-home mode with a 5 mph speed limiter. That's how seriously the EPA takes NOx.

Everyone wondered how VW met emissions standards while foregoing urea injection. As it turns out, they didn't. It wasn't magical German engineering. Just plain old fraud.

The second question concerned fuel economy. It's been widely noted that four-cylinder TDIs tend to smash their EPA fuel economy estimates in real-world driving. The last TDI Jetta SportWagen I drove was rated at 42 mpg highway, but on 60-mph two-lane roads I averaged more like 50 mpg. That's a huge difference. Did running non-compliant emissions improve fuel economy? That's possible. And if so, that raises an interesting question: When the cheater VWs emitted too much NOx, were they also emitting a lot less CO2 thanks to improved economy? Maybe the good doesn't offset the bad, but it's something to consider. You can bet that VW's lawyers will.

THE INTENTIONALITY BEHIND THE DECEIT MAKES THIS SITUATION DIFFERENT FROM EVEN A HUGE-SCALE RECALL.

So, how is Volkswagen going to fix this? Putting aside the inevitable fines, possible criminal charges, and massive public disgrace, there are half a million cars running an emissions setup that never should've left the factory. And there's no quick fix to make up for VW's lies.

All the other carmakers control diesel emissions by spraying a urea solution into the exhaust stream, where a catalyst converts it to ammonia. The ammonia breaks down NOx into nitrogen and water. If all of that sounds like it would be tough to bolt right in, you're correct. Maybe VW can meet the standards without adding equipment—say, by tweaking the engine control unit (ECU) with a different tuning. But what if that new tuning meets the emissions standards but sacrifices performance or fuel economy? Now you've got 482,000 customers on a class action lawsuit.

There's no easy way out of this, but they'd better figure something out, and pronto. Right now dealers are banned from selling 2.0-liter TDIs, which make up about a quarter of VW's U.S. sales. News of the scandal caused VW to lose about a quarter of its market value, indicating that investors understand how bad this is. There's no cheap fix nor easy settlement here.

The intentionality behind the deceit makes this situation different from even a huge-scale recall. This isn't a story about a part that was made one cent cheaper than it should've been, where a car company cut a corner to save a little cash. It's about a huge corporation eying

the rulebook and deciding there's a competitive advantage in violating the Clean Air Act. Incompetence is one thing, but calculated mendacity is quite another.

It's too bad. That Golf SportWagen TDI is a punchy, fun car. It's got great fuel economy, tons of torque and a bargain price. But when something seems a little too good to be true, maybe that's because it is.

Chicago Tribune:
http://www.chicagotribune.com/business/columnists/ct-rosenthal-vw-emissions-0922-biz-20150921-column.html

VW comes clean on dark heart of its diesel cars. Can it clear the air?
Phil Rosenthal

Seems VW fought diesel wars with smoke and mirrors, mostly smoke. What the fahrvergnügen?!
Volkswagen called it clean diesel. Clean like Lance Armstrong. Clean like the Chicago River.

Seriously, what the fahrvergnügen?!

VW has admitted to the Environmental Protection Agency that hundreds of thousands of its diesel cars have been using what is literally a killer app.

The software allowed the vehicles to sail through U.S. emissions tests while reportedly spewing 10 to 40 times the level of certain pollutants as allowed in ordinary use.

It's been smoke and mirrors — mostly smoke — for the last seven model years.

We're talking about 2009, 2010, 2011, 2012, 2013, 2014 and 2015 VW Golfs, Jettas and Beetles, along with Audi A3s, equipped four-cylinder, 2.0-liter turbodiesel engines. Oh, almost forgot the 2012-15 Passats.

That's nearly half-a-million vehicles in all, belching nitrogen oxide to preserve mileage ratings and performance no other carmaker could seem to match, thanks to emissions control systems programmed to operate only when testing protocols were detected.

So we get more smog and ozone and poisons tied to a litany of health problems, such as asthma attacks and other respiratory diseases, along with premature death. VW gets more

car sales.

Score one for German engineering and systematic subterfuge, trading our health for its profits.

Apparently the EPA was first tipped to VW's plot when discrepancies showed up in independent testing. But it seems like precisely the sort of thing James Bond is told of when strapped to a nuclear missile about to launch.

The word diabolical comes to mind.

So does evil.

One pictures even C. Montgomery Burns, king of the corner-cutters on "The Simpsons," looking askance. And we don't know yet if VW is the only offender.

The auto industry isn't overburdened by high expectations, particularly in the last 12 months or so.

General Motors last week agreed to a $900 million settlement to end a criminal investigation into its failure to disclose a deadly ignition defect.

Toyota last year agreed to a $1.2 billion penalty for withholding information about its vehicles' unintended acceleration linked to other fatalities.

Takata, it's been revealed, knew of dangerous, potentially fatal defects in its airbags long before alerting federal regulators, leading to the recall of millions of Honda, Toyota, Chrysler, Subaru, GM, Mitsubishi, BMW, Mazda, Nissan and Ford vehicles.

Yet, as Automotive News noted, "Compared with other run-ins between the EPA and automakers, VW's alleged violation stands out in its brazenness."

This takes that kind of amoral corporate behavior to a whole other threat level.

VW didn't just conceal something it discovered endangering people. It created technology for the specific purpose of allowing it to benefit from endangering people.

Even if you're one of those people who somehow isn't a fan of clean-air standards, it's not a political statement to press on and try to throw authorities off the trail. It's just a crime.

Tampering with emissions control systems, under terms of the Clean Air Act, could mean a fine for VW as high as $37,500 per vehicle or roughly $18 billion, though you know what happens when you start to haggle with car guys.

But even if VW is fined and there's a mandatory recall, some drivers will be reluctant to embrace the fix because it likely will make the vehicle less effective and efficient than the

one they thought they bought.

Funny we never caught wind of any of this in those slightly discomfiting VW commercials with the old ladies hitting on a salesman. Least we don't remember any mention of it.

VW pulled the ads off the air and, to the extent it could, off YouTube as word of its scandal came out, yet more proof that a carmaker can indeed move fast to protect something it actually cares about — like its bottom and bottom line.

This isn't the Olympics. It's one thing to try to keep test results from showing banned substances in one's own body, quite another to try to mask bad stuff being inflicted on others.

Cough.

This goes beyond the venality of one corporation to whether there's any confidence left in diesel cars and credibility in the entire auto industry. Even if this is as far as it goes, it will take quite a while to clear the air.

VW recently surpassed Toyota to become the world's largest carmaker, an achievement now eclipsed by the suspicion that there is nothing it wouldn't do.

Bloomberg (via Australian Financial Review):
http://www.afr.com/news/world/volkswagen-faces-us-criminal-probe-on-emissions-20150921-gjrtss

Volkswagen faces US criminal probe on emissions

The US Justice Department is conducting a criminal investigation of Volkswagen's admission to cheating on federal air pollution tests, according to two US officials familiar with the inquiry.

Volkswagen said last week it's cooperating with regulators probing gaps between emissions on the road and lab tests on some diesel models, affecting more than half a million cars. The US officials described the inquiry on condition of anonymity because it's a continuing investigation.

The Wolfsburg, Germany-based automaker plunged as much as 23 per cent Monday to 125.40 euros in Frankfurt, wiping out about 15.6 billion euros ($US17.6 billion) in market

value. The stock closed at 132.2 euros, its lowest in more than three years.

Volkswagen's admission is putting pressure on Chief Executive Officer Martin Winterkorn to repair the reputation of the world's biggest carmaker. Winterkorn, whose contract renewal is scheduled for a supervisory board vote on Friday, now faces a serious challenge to his leadership, said Arndt Ellinghorst, a London-based analyst for Evercore ISI.

"This latest saga may help catalyze further management changes at VW," Ellinghorst wrote in a note Monday.

Justice Department spokesman Wyn Hornbuckle declined to comment.

Criminal inquiries can take months or years and lead to charges against individuals and companies. They can also result in fines and deferred-prosecution agreements, such as the one recently struck with General Motors Co., to spur companies into improving their behaviour and addressing problems revealed during the investigations.

Volkswagen admitted on September 18 to fitting some of its US diesel vehicles with software that turns on full pollution controls only when the car is undergoing official emissions testing, the Environmental Protection Agency said Friday. Affected are diesel versions of the VW Jetta, Golf, Beetle and Passat and the Audi A3.

During normal driving, the cars with the software -- known as a "defeat device" -- would pollute 10 times to 40 times the legal limits, the EPA estimated. The discrepancy emerged after the International Council on Clean Transportation commissioned real-world emissions tests of diesel vehicles including a Jetta and Passat, then compared them to lab results.

VW said it's cooperating with regulators probing gaps between emissions on the road and lab tests on some diesel models. According to the EPA, the company insisted for a year that discrepancies were mere technical glitches.

Winterkorn, who has led VW since 2007, was forced to halt sales of the cars on Sunday and issue a public apology, saying he's "deeply sorry" for breaking the public's trust and that VW would do "everything necessary in order to reverse the damage this has caused."

The violations could result in as much as $US18 billion in fines, based on the cost per violation and the number of cars.

The US accusations are "grave" and must be clarified swiftly, said Stephan Weil, prime minister of the German state of Lower Saxony, which owns 20 percent of Volkswagen's voting shares. "Possible consequences can be decided after that."

The European Commission also said it's taking VW's cheating seriously and is in contact with US regulators and the company about details of the case.

The Guardian:
http://www.theguardian.com/business/2015/sep/21/volkswagen-emissions-scandal-sends-shares-in-global-carmakers-reeling

Volkswagen emissions scandal could snare other companies, whistleblower claims
Billions wiped off value of industry heavyweights amid concerns that manipulation of air pollution data could be 'very widespread'
Joanna Walters Graham Ruddick and Sean Farrell

The emissions-fixing scandal that has engulfed Volkswagen in the US could extend to other companies and countries, one of the officials involved in uncovering the alleged behavior told the Guardian on Monday.

Billions of pounds have been wiped off the value of global carmakers amid growing concerns that emissions tests may have been rigged across the industry.

"We need to ask the question, is this happening in other countries and is this happening at other manufacturers? Some part of our reaction is not even understanding what has happened exactly," said John German, one of the two co-leads on the US team of the International Council for Clean Transportation (ICCT), the European-based NGO that raised the alarm.

Shares in Volkswagen fell by almost a fifth after the world's second biggest carmaker issued a public apology in response to US allegations that it used a "defeat device" to falsify emissions data.

The US Justice Department is conducting a criminal investigation of Volkswagen admission, according to Bloomberg, which cited two officials familiar with the inquiry.

The company could face a fine of up to $18bn (£11.6bn), criminal charges for its executives, and legal action from customer and shareholders. The US law firm Hagens Berman has already launched a class-action law suit on behalf of customers who bought the affected cars.

VW shares fell by 19% in Frankfurt, wiping almost €15bn (£10.8bn) off its value. Shares in Renault, Volkswagen's French rival, also dropped by 4%, while Peugeot was down 2.5%, Nissan 2.5% and BMW 1.5% amid concerns they could be caught up in investigations.

The US Environmental Protection Agency said on Friday that VW had installed illegal software to cheat emission tests, allowing its diesel cars to produce up to 40 times more pollution than allowed. The US government ordered VW to recall 482,000 VW and Audi cars produced since 2009.

In response, Martin Winterkorn, chief executive of VW, said on Sunday he was "deeply sorry" for breaking the trust of the public and ordered an external investigation.

German tipped off regulators at the California Air Resources Board (Carb) and the US Environmental Protection Agency (EPA) after conducting tests that showed major discrepancies in the amount of toxic emissions some VW cars were pumping out compared with the legal limits.

Max Warburton, an analyst at the financial research group Bernstein, said: "There is no way to put an optimistic spin on this – this is really serious."

A British expert in low-emission vehicles claimed the manipulation of air pollution data could be "very widespread" and that tests in Europe are "much more open to this sort of abuse".

Greg Archer, a former government adviser and head of clean vehicles at the respected Transport & Environment thinktank, said: "I am not surprised. There has been a lot of anecdotal evidence about carmakers using these 'defeat devices'. All credit to the US's EPA for investigating and finding the truth."

Archer, the former managing director of the UK's Low Carbon Vehicle Partnership and non-executive director for the government's Renewable Fuels Agency, said the scandal could spread into petrol cars and CO2 levels. "It is probably not limited to diesel and not limited to emissions," he added.

The "defeat devices" are thought to work by injecting more urea – an exhaust fluid – into the car when it is being tested. This limits nitrogen oxide emissions. The car detects it is being tested because devices such as the anti-collision systems have to be turned off when it is in the laboratory. The extra urea is not injected into the car when it is on the road because it would quickly run out.

Archer claims European tests are more open to abuse because they are conducted before the car goes into mass production and by companies that have been paid by the carmakers. These testing companies have been verified by regulators in each country, such as the Vehicle Certification Agency, but in the US the tests are conducted by an independent body.

Industry leaders in Britain claimed there was "no evidence" that manufacturers are cheating the system in Europe but admitted it needs to be reformed.

Mike Hawes, chief executive of the Society of Motor Manufacturers and Traders, the industry trade body, said: "The EU operates a fundamentally different system to the US – with all European tests performed in strict conditions as required by EU law and witnessed by a government-appointed independent approval agency. There is no evidence that manufacturers cheat the cycle.

"The industry acknowledges, however, that the current test method is outdated and is seeking agreement from the European Commission for a new emissions test that embraces new testing technologies and is more representative of on-road conditions."

The US allegations involve a series of diesel cars produced by VW and the brands it owns, such as Audi. These include the Audi A3, VW Jetta, Beetle, Golf and Passat models. VW has halted sales of these models.

Jochen Flasbarth, a senior environment official in the German government, accused Volkswagen of "blatant consumer deception" over the scandal. The country's economy minister, Sigmar Gabriel, also warned it could damage the reputation of the country's vital automotive industry.

"That this is a bad case, I think is clear," Gabriel said. "You will understand that we are worried that the justifiably excellent reputation of the German car industry and in particular that of Volkswagen suffers." The German government has launched its own investigation into VW and held talks with executives.

The scandal puts the future of Volkswagen chief Winterkorn in serious doubt. Earlier this year he won an internal power struggle with Ferdinand Piëch, who stepped down as chairman. The board of the company is due to meet on Friday to discuss extending Winterkorn's contract.

Winterkorn has been at the helm of VW since 2007 and has been directly responsible for research and development since then.

Guido Reinking, a German automotive analyst, told German television station n-tv: "It's almost impossible to imagine that he didn't know about this special way of programming the engine."

David Bailey, professor of industrial strategy at Aston University in Birmingham, said: "If it is the case that they have been trying to hoodwink regulators, it's a really dumb thing to do. Regulators will look at this more closely now. There has been growing concern about diesel cars and nitrous oxide emissions. The industry has been trying to make the case that the latest regulations largely deal with that issue but regulators will now look more closely at whether they have."

In the wake of the scandal two senior VW executives cancelled a planned appearance at a media event in New York with rock star Lenny Kravitz scheduled for Monday evening.

Herbert Diess, chairman of the VW brand's management board, and Heinz-Jakob Neusser, VW's board member in charge of technical development, had planned to attend the event to introduce the latest version of the Passat mid-size sedan.
The chief executive of VW's US arm, Michael Horn, was still due to attend the event. He is expected to provide a statement about the situation.

Volkswagen Is Now The Target Of A Criminal Investigation: Report
Michael Ballaban

In a move that seemed like an inevitability at this point, the United States Department of Justice is said to have opened a criminal investigation into Volkswagen's admission to cheating on diesel emissions tests, a report from Bloomberg said.

While we had heard rumblings of a possible criminal probe earlier, this news appears to confirm that VW is in fact the subject of an investigation that could lead to prosecutions.

It's way too early to tell whether or not any individuals will personally be held criminally liable for the company's deceptions, but it's not out of the realm of possibility. We haven't seen a case in a long time where a company has admitted intentionally circumventing the law, rather than just a plea of massive institutional incompetence, so it's anyone's guess as to what will happen.

The U.S. Environmental Protection Agency has said that the company can be held responsible for up to $18 billion in fines.

Business Insider:
http://www.businessinsider.com/the-us-government-is-launching-a-criminal-investigation-into-vws-falsified-emissions-figures-2015-9

The US government is launching a criminal investigation into VW's falsified emissions figures
Benjamin Zhang

The US Department of Justice has launched a criminal probe into Volkswagen's falsification of emissions data, Bloomberg news is reporting.

Last week, the Environmental Protection Agency accused the automaker of falsifying the data using secret software in nearly 500,000 cars.

According to Bloomberg's Del Quentin Wilber, two government officials close to the situation say the Justice Department is conducting a criminal investigation into the allegations.

Last week, the EPA accused VW of using the hidden software — called a "defeat device" — to dodge clean-air standard during emissions testing.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," assistant administrator for the Office of Enforcement and Compliance Assurance Cynthia Giles said in a statement on Friday.

"Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

The EPA alleges that VW installed software that detects when the car is undergoing emissions testing, at which point the software would turn on all of the car's emissions control systems. But the EPA claims that the software greatly reduces the cars' pollution-control systems during normal driving conditions.

"This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the standard," the EPA said in a statement.

Across the Atlantic, the German government is also taking a look at Volkswagen's emissions data. A spokesperson for the country's Motor Vehicle Agency told the Wall Street Journal that is has asked automakers to provide accurate emissions information to "determine whether similar instances of manipulation have taken place in Germany or Europe," However, there is no word of any official investigation on the part of the German government.

Over the weekend, VW CEO Martin Winterkorn issued the following statement:

The U.S. Environmental Protection Agency and the California Air Resources Board (EPA and CARB) revealed their findings that while testing diesel cars of the Volkswagen Group they have detected manipulations that violate American environmental standards.

The Board of Management at Volkswagen AG takes these findings very seriously. I personally am deeply sorry that we have broken the trust of our customers and the public. We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly, and completely establish all of the facts of this case. Volkswagen has ordered an external investigation of this matter.

The recall affects 482,000 diesel-powered cars sold in the US since 2008. They include:

Volkswagen Jetta TDI: 2009-20015
Volkswagen Beetle TDI: 2009-2015
Audi A3 TDI: 2009-2015
Volkswagen Golf TDI: 2009-2015
Volkswagen Passat TDI: 2014-2015

We have reached out to Volkswagen and the DOJ for comment. We will update when when we hear back.

Fortune:
http://fortune.com/2015/09/21/volkswagen-emissions-recall-scandal/

Dear Volkswagen: Exaggeration? Not so bad. Deception? Never okay
by Jennifer Reingold @jennrein SEPTEMBER 21, 2015, 3:44 PM EDT

One wonders what would have happened had Volkswagen opted for exaggerating its results rather than falsifying them.

The business world—and the journalists who cover it—have always rewarded a healthy bit of hype. Best Ever! New and Improved! Now with enhanced whatevers!

Actually, the love of the big claim goes far beyond the business world and is interwoven throughout society. Donald Trump's current popularity is only the latest example of bombast, er, trumping reality.

But we do have limits, as the scandal at Volkswagen shows. So far, the company's stock price has fallen almost 20% since it admitted on September 18 that it had installed software that allowed its cars to fake their performance on emissions testing in order to fool the EPA.

No one knows what will happen to the $221 billion in sales car company—the world's largest—going forward, and whether the deception stretches all the way to the CEO, Martin Winterkorn. But one wonders what would have happened had the company opted for exaggerating its results rather than falsifying them.

Don't get me wrong: I'm not advocating that any performance standards—particularly those that affect safety and health—should ever be presented with anything but the full truth. But this move was so brazen, so breathtakingly full of chutzpah, that it is hard to imagine VW's brand recovering for a very, very long time; nor, one imagines, will its culture.

The plot goes far beyond one or two people hiding out in a cubicle and must have involved hundreds of people building such a system and making sure it was implemented inside of 428,000 cars. One wonders what the company might have been able to accomplish instead if it put all that brainpower toward meeting emissions requirements rather than circumventing them.

Consider the alternative: VW tried—and failed—to meet the EPA's emissions standards, after saying that they believed they had diesel engines that did the job. The EPA (which, it's worth noting, relies primarily on self-tested data) would have—hopefully—tested its engines, found Volkswagen deficient, and fined the company. It would have been costly, yes, but it wouldn't have been all that surprising. And VW's credibility wouldn't have been destroyed in the process. After all, exaggeration, for better or worse, is just how the game is

played.

MarketWatch:
http://www.marketwatch.com/story/white-house-quite-concerned-about-volkswagen-emissions-charges-2015-09-21

White House 'quite concerned' about Volkswagen emissions charges
'Quite concerned': How White House press secretary Josh Earnest characterized Obama administration reaction to the allegations against Volkswagen.
By ROBERT SCHROEDER

The Obama administration is "quite concerned" over allegations that Volkswagen cheated on U.S. emissions tests, a White House spokesman said Monday, but added it is up to the Environmental Protection Agency to investigate the matter.

"I think it's fair to say that we're quite concerned by some of the reports that we've seen about the conduct of this particular company," spokesman Josh Earnest told reporters at a regular briefing.

On Friday, the Environmental Protection Agency and the California Air Resources Board alleged that Volkswagen VLKAY, -17.38% VOW3, -18.19% used software in cars to make diesel-powered engines appear to have lower levels of emissions than they actually did. The company halted U.S. sales of some diesel-powered cars.

Earnest said it is ultimately the responsibility of the EPA to look at the issue, "and that's exactly what they're doing."

Reaction from Congress was minimal — though that could change.

"VW should expect scrutiny from Congress, legal problems, a potential multibillion-dollar fine and a batch of uncomfortable headlines," wrote Forbes contributor Micheline Maynard on Monday.

"If Volkswagen willfully sought to evade the Clean Air Act and fraudulently sold cars to millions of consumers with this technology, EPA should pursue the most severe action possible to deter others from doing the same," Rep. Frank Pallone, a New Jersey Democrat, said on Friday.

"We must ensure that this does not happen again and that consumers can trust the products that they buy," said Pallone, the top Democrat on the House Energy and Commerce Committee. The panel's oversight and investigations subcommittee held one of the several hearings into the General Motors GM, +0.43% ignition-switch recall in April 2014.

The allegations reportedly include Volkswagen Passats made at the company's Chattanooga, Tenn., facility in 2014 and 2015. A Volkswagen spokesperson did not

immediately return a request for comment.

MarketWatch reached out to members of Tennessee's congressional delegation, but none offered any comment.

The 1,400-acre Chattanooga plant has more than 3,200 Volkswagen employees, the company says.

Volkswagen's appalling clean diesel scandal, explained
Brad Plumer

It sounds like the sinister plot of some straight-to-DVD movie. Since 2009, Volkswagen had been installing elaborate software in 482,000 "clean diesel" vehicles sold in the US, so that the cars' pollution controls only worked when being tested by regulators. The rest of the time, the vehicles could freely spew hazardous, smog-forming nitrogen oxides.

Suffice to say, regulators were livid once they caught on. On Friday, the Environmental Protection Agency announced that Volkswagen had very flagrantly violated the Clean Air Act. Not only did the EPA order the German company to fix the affected vehicles,** but the agency has the authority to levy fines as high as $37,500 per car, a maximum of $18 billion. (To put that in perspective, the company's pretax net income was about $4.7 billion last year.) The US government is also mulling criminal charges.

Volkswagen, in other words, is in deep shit. The company's CEO, Martin Winterkorn, is now apologizing profusely and pledging an external probe to find out what happened. VW just halted US sales of its 2015 and 2016 clean diesel vehicles, including Passat, Jetta, Golf, and Beetle models. Meanwhile, VW's stock price plummeted on Monday morning, the company losing nearly one-fifth its market cap in a blink:

This scandal raises a few larger questions, though: Why did Volkswagen cheat in the first place? And why was it so easy for the company to evade regulators for years? To get a better handle on the story, we need to take a brief trip through the tangled history of clean diesel vehicles — the specific cars that VW was selling.

Clean diesel cars were supposed to offer great mileage and low pollution — a tricky task

One basic fact to understand here is that there are two main types of combustion engines widely available today: diesel and gasoline. And there are real trade-offs to each.

Diesel engines have long been popular in Europe, and one of their major advantages is fuel economy. Diesel fuel contains more energy per gallon than gasoline, and the diesel engines themselves are more efficient. Put it together, and the typical diesel car can travel up to 30 percent farther on a gallon of fuel than its gasoline counterpart.

But there's a catch. While diesel cars get better mileage and emit fewer carbon-dioxide emissions, they also emit more nitrogen oxides (NOx), which help form smog, and particulate matter, which can damage lungs. Both types of pollution can have serious health effects.

Historically, Europe has dealt with this trade-off by imposing looser emissions standards on diesel cars in order to pursue higher fuel economy. That's one reason European cities like Athens have a serious smog problem. In the United States, by contrast, we've imposed much stricter rules around smog and other conventional pollutants since the 1970s, one reason diesel cars haven't caught on as widely here. (Heavy trucks favor diesel engines, though.)

In recent years, however, things have shifted. The Obama administration has been ratcheting up fuel-economy standards in the United States, which puts a higher premium on mileage. At the same time, diesel technology has gradually been getting cleaner through a combination of lower-sulfur fuel, advanced engines, and new emission-control technology. So automakers have shown a renewed interest in "clean diesel" cars that, in theory, don't suffer from that trade-off between performance and pollution.

These vehicles have proved popular in the United States. Since 2009, Volkswagen has sold more than 482,000 clean diesel cars containing a four-cylinder turbocharged direct injection engine. This included versions of the Passat, Jetta, Golf, Beetle, and Audi's A3. Drivers liked them.

Except, as it turns out, VW was lying about its clean diesel cars.

Volkswagen couldn't balance performance with low pollution. So it cheated.

Since 2009, we now know, Volkswagen had been inserting intricate code in its vehicle software that tracked steering and pedal movements. When those movements suggested that the car was being tested by regulators in the laboratory for nitrogen-oxide emissions, the car automatically turned its pollution controls on. The rest of the time, the pollution controls switched off.

Regulators didn't notice this ruse for years. The problem was only uncovered by an independent group, the International Council on Clean Transportation, which wanted to investigate why there was such a discrepancy between laboratory tests and real-road performance for several of VW's diesel cars in Europe. So they worked with researchers at West Virginia University, who stuck a probe up the exhaust pipe of VW's clean diesel cars

and drove them from San Diego to Seattle. (These details come from Dana Hull and Jeff Plungis' excellent Bloomberg tick-tock.)

What the researchers found was jaw-dropping. On the road, VW's Jetta was emitting 15 to 35 times as much nitrogen oxide as the allowable standard. The VW Passat was emitting 5 to 20 times as much. These cars were emitting much more pollution than they had in the labs.

Both California's air-pollution regulator and the EPA ordered Volkswagen to investigate and fix the problem in May 2014, and the company said it had worked on a software patch. Once again, the cars performed well in testing. And once again, real-world performance didn't match up. At that point, regulators started grilling Volkswagen's engineers about the discrepancy, and the company eventually cracked, admitting the existence of these defeat devices, which had been carefully hidden in the software code. Hence the scandal.

Volkswagen hasn't explained exactly why it cheated, but outside analysts have a pretty good guess. The NOx emission controls likely degraded the cars' performance when they were switched on — the engines ran hotter, wore out more quickly, and got worse mileage. Some experts have suggested that the emission controls may have affected the cars' torque and acceleration, making them less fun to drive. (Indeed, some individual car owners have been known to disable their cars' emission controls to boost performance, though this is against the law.)

In other words, Volkswagen wasn't able to produce diesel cars that had the ideal mix of performance, fuel economy, and low pollution. (Or, at least, they couldn't do this profitably.) So they "solved" this trade-off by sacrificing cleanliness and loosening the emission controls. And they accomplished this via software designed to deceive regulators. This was wildly illegal, and they got caught.

The VW scandal exposes problems with current emission tests

Volkswagen isn't the first company to cheat on its emission tests. As Frank O'Donnell of Clean Air Watch pointed out to me, the EPA caught a number of truck manufacturers, including Caterpillar and Volvo, doing something similar back in 1998 — programming their diesel trucks to emit fewer pollutants in lab tests than they did on the road. (The trucks would slowly emit more and more NOx as they traveled longer distances at constant speed, something that labs couldn't catch.)

Part of the problem here is that regulators tend to test these vehicles in laboratory conditions, which are fairly predictable and hence easier to game. Combined with the fact that automakers are developing ever-more-elaborate software that can control and fine-tune engines, and there are ample opportunities for fraud.

EUROPEAN REGULATORS WILL SOON START REQUIRING ON-ROAD EMISSIONS TESTING

In theory, there are ways to make cheating harder. Starting with model year 2017 vehicles, European regulators are going to start requiring automakers to test their passenger cars on the road in addition to laboratory testing. That sort of regime would've made it harder for Volkswagen to do what it did. But it's also unlikely that this is the last time we'll see an automaker come up with a fiendishly clever way to cheat.

Meanwhile, the VW scandal raises another issue surrounding car regulations, as Alex Davies explains at Wired. Modern-day cars feature complex computer systems and software. And, right now, this software is protected under the 1998 Digital Millennium Copyright Act — it's illegal to fiddle with it. The ostensible rationale is to make it harder for consumers to tamper with emissions controls. But these protections also make it harder for independent researchers to scrutinize that code and identify problems like VW's little emissions trick. Some experts have proposed DMCA exemptions to allow researchers to test and evaluate these engines, but so far automakers and the EPA have resisted this. Presumably, if those exemptions had existed, Volkswagen might've been caught sooner.

Volkswagen is now facing serious consequences

At this point, Volkswagen has been caught red-handed and has to face the consequences. The company straight-up lied about its cars and exacerbated the country's air-pollution problem. (Getting a precise estimate of the health consequences here could be difficult, since it depends on where the cars were located, how much extra smog actually resulted, and so forth.)

In response, the company has pledged to stop selling 2015 and 2016 Volkswagen and Audi models equipped with clean diesel engines and will likely end up recalling the 482,000 cars now on the road to fix the software.** It's unclear how many customers will want to "fix" the problem, however, since, again, any patch might degrade gas mileage and/or performance.

Meanwhile, Volkswagen could face criminal prosecution — not to mention billions of dollars in fines, potentially. The Clean Air Act allows a fine of $37,500 per noncompliant vehicle. If the EPA really wanted to lower the hammer, that would amount to $18 billion. Again, VW's pretax net income was about $4.7 billion last year, so that would be a crippling hit. Volkswagen is the world's biggest automaker by sales, but it's not quite as profitable as competitors like Toyota and has already struggled to gain a foothold in the US market. This could be a huge deal for the company.

It also raises questions about the future of clean diesel vehicles. Clean diesel appears to be a promising technology — in theory, these vehicles could get both excellent mileage and low emissions. But this scandal raises serious questions about how well automakers can actually achieve both goals in practice.

** For any concerned car owners, the models expected to be recalled include: The 2009-2015 VW Beetle 2.0L TDI; 2009-2015 VW Golf 2.0L TDI; 2009-2015 VW Jetta 2.0L TDI; 2009-2015 Audi A3 2.0L TDI; and 2014-2015 VW Passat 2.0L TDI.

Ledger Gazette:
http://www.ledgergazette.com/epa-accuses-vw-of-cheating-on-emissions-tests/79148/

EPA accuses VW of cheating on emissions tests
BY JORGE WEINER ON SEPTEMBER 21, 2015 BUSINESS

VW halted sales of the models involved on Sunday and said it's cooperating with the probe and ordered its own external investigation into the issue.

"The charges here are truly appalling: that Volkswagen knowingly installed software that produced much higher smog-forming emissions from diesel vehicles in the real world than in pre-sale tests", said Frank O'Donnell, president of Clean Air Watch, a Washington-based advocacy group.

VW is to stop selling four cylinder diesel cars in the USA after the firm was found to have rigged emissions test on up to 500,000 vehicles, it has emerged. The reality is that Volkswagen will face huge fines, rumoured to be as high as 18 billion US dollars.

German competitors BMW AG and Daimler AG said on Monday they aren't aware of a similar USA probe into their cars.

Once on the road, the cars produced nitrogen oxide pollutants at up to 40 times the legal standard.

The EPA and California authorities acted quickly after being told of the violation, German said.

Volkswagen, which recently edged out Japan's Toyota to become the world's top-selling automaker, has had a hard year, its share price having fallen from more than 250 euros amid signs of faltering sales in the US and China. He said he was "deeply sorry" for the violation of United States rules. The models include Jetta, Beetle, Golf, Passat and Audi A3.

Stefan Bratzel, director at the Center for Automotive Management, a research group, said the damage to VW's image would be as great as the financial fines.

"Our climate policy stands for itself and I think it's internationally recognized that Germany is one of the drivers on the way to (the global climate summit in) Paris", he said. The potential wonderful is $37,500 per vehicle and 482,000 autos are a part of the case, yielding a possible superb of greater than $18 billion, Giles stated on a telephone name with reporters Friday.

The EPA in November 2014 hit South Korean auto makers Hyundai Motor Co. and Kia Motors Corp. with a record $100 million penalty for overstating fuel-economy claims and forced the companies to cough up another $200 million in regulatory credits.

The cars allegedly do so with software that detects when the vehicle is undergoing emissions testing, and then turns full emissions controls on only during the test. When vehicles are being driven normally, the computer disables the emissions controls.

According to the The New York Times, this latent software within numerous Volkswagen vehicles switches on emissions control systems only during an inspection. The California Air Resources Board issued a similar letter.

"Our goal is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules and to take appropriate further action".

The feature, which the EPA called a "defeat device", masks the true emissions only during testing.

VW under fire amid EPA accusations it cheated on emissions tests
By Thad Moore

Volkswagen shares plunged Monday after U.S. regulators accused the German automaker of cheating on emissions tests, alleging that nearly 500,000 cars weren't meeting federal standards.

An apology Sunday from VW's chief executive did nothing to temper anxious investors, who wiped out nearly a fifth of the company's value in a single day. VW's stock closed the day Monday at 132.20 euros, down 19 percent.

The selloff comes on the heels of Environmental Protection Agency allegations that the automaker had designed software to let its diesel cars detect when they were being tested for emissions.

VW, one of the world's largest automakers, has halted sales of some vehicles in the United States and pledged to cooperate with regulators. "We at Volkswagen will do everything that must be done in order to re-establish the trust that so many people have placed in us, and we

will do everything necessary in order to reverse the damage this has caused," Martin Winterkorn, VW's chief executive, said in a statement.

In the lab, they met standards. On the road, regulators say, they emitted nitrous oxide at up to 40 times federal standards. The software, known as a "defeat device," was installed in some 482,000 cars, spanning model years 2009 through 2015, regulators say.

The EPA and California regulators began asking questions in May 2014 after West Virginia University researchers published a study that found lab results didn't match up with road tests.

For more than a year, VW told regulators that the difference owed to "various technical issues and unexpected in-use conditions," the EPA said in a letter sent to the automaker Friday. But company officials didn't admit to the practice until earlier this month when regulators threatened not to approve its 2016 line of diesel cars.

The years-long practice could carry a hefty price tag for the automaker. The company could be fined $37,500 for each car it sold with a defeat device installed — a potential fine of $18 billion.

"The company will have to recall nearly 500,000 affected cars, which will cost it millions of dollars, and that's even before the damage to its brand and potential fines," Michael Hewson, chief market analyst at CMC Markets, told the Associated Press.

The revelation also led Consumer Reports[consumerreports.org] to pull its recommendation of VW's Jetta and Passat diesel model. (The magazine said it would reconsider its decision once the automaker introduces a fix to lower emissions.)

For his part, Winterkorn apologized Sunday, saying the company would cooperate "with transparency and urgency."

"I personally am deeply sorry that we have broken the trust of our customers and the public," he said in a statement. "We do not and will not tolerate violations of any kind of our internal rules or of the law."

Volkswagen Denied Deception to E.P.A. for Nearly a Year
By JACK EWING SEPT. 21, 2015

FRANKFURT — For nearly a year, Volkswagen officials told the Environmental Protection Agency that discrepancies between the formal air-quality tests on its diesel cars and the much higher pollution levels out on the road were the result of technical errors, not a deliberate attempt to deceive Washington officials.

But early this month, Volkswagen executives finally made a startling admission: The diesels it sold in the United States had software deliberately designed to cheat on the tests.

The company was evidently concerned that actually meeting the federal emissions standards would degrade the power of the engines, which it marketed as comparable in performance to gasoline engines. Meeting the standard would also undercut the fuel efficiency that is one of the main selling points of diesels.

The admission came only after the E.P.A. threatened to withhold approval for Volkswagen's new 2016 models, according to letters sent to company officials by the E.P.A. and California regulators.

Since news of that mass deception broke on Friday, Volkswagen has scrambled to conduct damage control, with its chief executive issuing an apology and the company saying it would not sell its 2015 and 2016 diesel cars in the United States.

But that did not stop Volkswagen shares from plummeting when trading opened in Europe on Monday. And the apology has not relieved pressure on Martin Winterkorn, the Volkswagen chief executive, whom analysts said would have tough questions to answer, seeking to know when he and other top executives at the company, which is ruled from the top with Germanic precision, were aware of the diesel deception.

Adding to pressure on Volkswagen, the German government said on Monday that it would also begin an inquiry to make sure that Volkswagen and other carmakers are complying with laws on auto emissions.

The E.P.A. disclosed the yearlong series of letters with Volkswagen as part of accusations it made against the company on Friday. The agency will require the company to recall nearly half-a-million vehicles equipped with 2-liter diesel engines dating to the 2009 model year. Volkswagen also faces fines that could run into the billions of dollars.

Volkswagen shares plunged about 20 percent on Monday, as investors registered alarm at the damage the company could suffer.

Mr. Winterkorn issued an apology on Sunday, saying the company had "broken the trust of our customers and the public."

But the sophistication of the software used to manipulate emissions tests in the United

States, and extensive attempts by Volkswagen to deflect official scrutiny before admitting misconduct this month, are sure to raise questions about Mr. Winterkorn's effectiveness only months after he survived an internal power struggle.

"Either he knew, or he didn't know, which is even worse," said Ferdinand Dudenhöffer, a professor at the University of Duisburg-Essen who is a longtime Volkswagen critic. "Any politician in his situation would have to resign."

Volkswagen's supervisory board, which Mr. Winterkorn reports to, will hold a regularly scheduled meeting on Friday, and it is certain to discuss the E.P.A. action.

After being confronted last year with evidence that some diesel models did not comply with pollution standards under certain conditions, Volkswagen executives originally offered technical explanations, according to a letter of complaint sent to the company by the E.P.A. and the California Air Resources Board.

It was only on Sept. 3, according to the letters, that executives at Volkswagen of America, the company's United States unit, admitted that cars equipped with the 2-liter diesel motors contained the software.

The software measured factors such as the position of the steering wheel, the vehicle's speed and even barometric pressure to sense when the car was being subjected to testing, the E.P.A. said. The car then configured itself to reduce emissions of nitrogen oxide, a gas that is a major contributor to smog and is linked to an array of respiratory ailments including asthma, emphysema and bronchitis, the E.P.A. said on Friday.

Volkswagen is known for being a tightly controlled, autocratic organization, raising questions about how such a sophisticated system could have been installed in nearly half a million vehicles without knowledge of top management.

The plunge in Volkswagen shares was a clear indication that investors believe that company profit and sales could suffer because of the E.P.A. accusations. However, Volkswagen is relatively immune to stock market pressure because only 12 percent of its voting shares are traded. Porsche Automobil Holding, controlled by members of the Porsche family, holds a slight majority. The state of Lower Saxony owns 20 percent and the sovereign wealth fund of Qatar owns 17 percent.

Stephan Weil, the prime minister of Lower Saxony, where Volkswagen has its headquarters and major manufacturing operations, said in a statement on Monday, "Manipulation of an emissions test is completely unacceptable and without any justification."

But Mr. Weil said consequences could be discussed only after a thorough investigation of the circumstances.

In Berlin, the government of Chancellor Angela Merkel said it would ask carmakers for information as the first step in an inquiry.

"We expect reliable information from carmakers so that the Federal Office for Vehicles can check whether similar manipulation in the exhaust systems has taken place in Germany or Europe," Andreas Kübler, a spokesman for the Environment Ministry, told reporters in Berlin.

The European Commission has contacted Volkswagen as well as the E.P.A. for details about the accusations, a commission spokeswoman said.

"It is premature to comment on whether any specific immediate surveillance measures are also necessary in Europe and whether vehicles sold by Volkswagen in Europe are also affected," the spokeswoman said in an email. "We are taking the matter very seriously."

South Korea also planned to test Volkswagen cars to make sure they were in compliance with pollution rules, according to news reports.

More than half of all vehicles sold in Europe are diesels, which are popular because they typically offer better fuel economy than gasoline. European Union pollution rules were more favorable to diesels than United States rules, but they have been progressively tightened. The most recent standard, known as Euro 6, took effect for all new cars sold on Sept. 1.

Technology exists to reduce the amount of nitrogen oxides emitted by diesels. But the technology also tends to reduce fuel economy as well as performance. The software installed by Volkswagen on vehicles sold in the United States avoided this trade-off, which could have come as a disappointment to American customers, by scaling back pollution controls when the car was not being tested.

The accusations by the E.P.A. are a blow to Volkswagen's efforts to build up its meager market share in the United States, in part by promoting "clean diesel" technology.

The silver lining for Volkswagen, though, may be that its most profitable vehicles in the United States are Porsche and Audi cars not affected by the E.P.A. action. The cars affected are Volkswagen Golf, Jetta, Beetle and Passat models from 2009 through 2015 that are equipped with 2-liter diesel engines.

Another silver lining for Volkswagen may be that diesel powered cars account for only a tiny fraction of sales in China, which is the company's largest market.

Among Audi models, only the compact A3 is affected in the United States. The A3 accounted for less than a fifth of the 111,000 vehicles that Audi sold in the United States from January through August, and only a fraction of those A3s would have been equipped with diesels.

The E.P.A. said on Friday that Volkswagen would be required to recall the affected vehicles for repairs to make them compliant with smog regulations. Car owners would not have to

pay for the repairs. Many owners may not bother, though, because the changes are likely to reduce fuel consumption and performance.

John Schilling, a Volkswagen spokesman, said on Sunday that the company would stop selling 2015 and 2016 Volkswagen and Audi models equipped with the 2-liter diesel engines, which the company had marketed as "clean diesel." The company will also stop selling used cars that have the engines, Mr. Schilling said.

He said he did not know how many models would be stuck on dealer lots as a result of the decision. This month, Volkswagen had said that 23 percent of new cars sold in August in the United States were diesels, or 7,400 vehicles. Some diesels, such as those used in Volkswagen S.U.V.s, are not affected by the E.P.A. action.

Faulty Tests Cost VW Billions
By FRANK JORDANS and PAN PYLAS, Associated Press

BERLIN (AP) — Around 15 billion euros ($16.9 billion) was wiped off the market value of Volkswagen AG on Monday following revelations that the German carmaker rigged U.S. emissions tests for about 500,000 diesel cars.

By midday trading in Frankfurt, Volkswagen's share price was 19.3 percent lower at a three-year low of 130.20 euros. Its dramatic fall weighed heavily on Germany's main stock index, the DAX, which underperformed its peers in Europe with a 0.6 percent decline.

Volkswagen's market woes Monday follow a weekend that saw the company's reputation for probity seriously damaged by revelations from the Environmental Protection Agency in the U.S. that it had skirted clean air rules. All told, the EPA indicated that VW faces fines that could run up to more than $18 billion.

The EPA said VW used a device programmed to detect when the cars are undergoing official emissions testing. The software device then turns off the emissions controls during normal driving situations, allowing the cars to emit more than the legal limit of pollutants.

Volkswagen marketed the diesel-powered cars, which account for about 25 percent of sales, as being better for the environment. The cars, built in the last seven years, include the Audi

A3, VW Jetta, Beetle, Golf and Passat models.

"The company will have to recall nearly 500,000 affected cars, which will cost it millions of dollars, and that's even before the damage to its brand and potential fines," said Michael Hewson, chief market analyst at CMC Markets.

The agency has ordered VW to fix the cars at its own expense but said car owners do not need to take any immediate action. The EPA insisted that the violations do not pose any safety hazard and said the cars remain legal to drive and sell while Volkswagen comes up with a plan to recall and repair them. However, it said the cars posed a threat to public health.

The EPA also indicated the scale of the fines that could be imposed on VW. It said the carmaker could be hit up to $37,500 per vehicle for the violations — a total of more than $18 billion. The California Air Resources Board is also investigating.

Volkswagen has had a difficult year, its share price having fallen from over 250 euros amid signs of faltering sales in the U.S. and China.

VW edged out Toyota to become the world's top-selling automaker the first half of 2015. But a hit to its reputation from the emissions revelations could hamper its efforts at a sales rebound in the U.S.

If other regulatory authorities decide VW has a case to answer, then the carmaker faces the potential for even bigger fines.

"The news so far revolves around the U.S. impact, but if European investigators become interested the potential penalties could multiply very quickly," said Chris Beauchamp, senior market analyst at IG.

Volkswagen 'sorry,' promises probe on EPA violations
By DANIEL CHAITIN (@DANIELCHAITIN7) • 9/20/15 3:23 PM

Volkswagen apologized Sunday following allegations by the Environmental Protection Agency and the state of California that hundreds of thousands of diesel cars made by the German automaker are breaking emissions laws in the United States.

"The Board of Management at Volkswagen AG takes these findings very seriously," wrote Martin Winterkorn, CEO of Volkswagen. "I personally am deeply sorry that we have broken the trust of our customers and the public. We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly, and completely

establish all of the facts of this case. Volkswagen has ordered an external investigation of this matter."

On Friday, the EPA and California charged Volkswagen with willfully installing software in its 4-cylinder diesel cars that would allow cars to bypass emission standards. The cars cited for violations include signature Volkswagen cars manufactured between 2009 and 2015, including the Jetta, Passat, Beetle and Golf, as well as the A3 from Audi, Volkswagen's luxury line.

All together, about 482,000 diesel passenger cars sold in the United States since 2008 are included in the allegations.

The statement promises that Volkswagen will "re-establish trust" it may have lost and that the company will reverse any damage done.

"We do not and will not tolerate violations of any kind of our internal rules or of the law," Winterkorn added.

The EPA issued a notice of violation to Volkswagen, while the state of California sent an In-Use Compliance letter. Both the EPA and the California Air Resources Board are conducting separate investigations into the alleged misbehavior.

Recalls are likely, and the combined fines could add up to $18 billion if the result of the investigations support the allegations.

The EPA alleges that the Volkswagen cars are fitted with software to trick emission testers, but that under normal operation emit nitrogen oxides at up to 40 times the standard. Under the Clean Air Act, such an instrument is classified as a "defeat device."

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, EPA assistant administrator for the Office of Enforcement and Compliance Assurance. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

Volkswagen Skirts EPA Rules; It's Not the First Time
By Arleen Richards

Volkswagen Group of America admitted to sidestepping clean air standards after the EPA and California's clean air watchdog confronted the German automaker with evidence of high in-use emissions from light-duty diesels.

On Friday, Sept. 18, the EPA slapped VW with a notice of violation for using sophisticated software to circumvent national emissions standards. The software, which the EPA calls a "defeat device," is designed to implement full emissions control systems when the car is undergoing state emissions testing. During normal driving, the emissions control is turned off, permitting the significantly harmful diesel fumes to be expelled—40 times more than allowed under the Clean Air Act. VW and the California Air Resources Board (CARB) have both initiated investigations.

Volkswagen CEO Dr. Martin Winterkorn, on Sunday, apologized for breaking the public's trust and vowed to cooperate fully with agency investigations.

He ordered an internal investigation, saying in a statement, "We do not and will not tolerate violations of any kind of our internal rules or of the law."

But this episode is not the first time the EPA or CARB has had run-ins with VW. In the past, both agencies charged VW with similar violations, which resulted in penalties.

Defective Oxygen Sensors
VW previously failed to report its discovery of emission defects in at least 329,000 of its 1999, 2000, and 2001 Golf, Jetta, and New Beetle vehicles.

In May 2001, after conducting a random test, the EPA identified a problem with tailpipe emissions in the 1999 model vehicles caused by a failed oxygen sensor. It turns out, VW knew about the problem for a year already—since it had received numerous warranty claims associated with cracked oxygen sensors—but failed to report it. According to the Clean Air Act, any emission-related defect found in 25 vehicles or engines of the same model year has to be reported within 15 days.

VW spent $26 million in January 2002 to recall all the vehicles and replace or repair the part. Another estimated $660,000 was spent on an enhanced defect tracking system.

The EPA finally settled its case with VW in 2005, penalizing the delinquent car maker $1.1 million.

The state of California has been working closely with the EPA in testing VW cars and issued a separate notice of violation to VW in the current case.

California has been a leader in clean energy investments and set the stage in 2006 for transitioning to a sustainable, low-carbon future with the passage of AB 32, a law requiring sharp reduction in greenhouse gases. Since then, several legislative initiatives have been implemented to build the next generation of clean, fuel-efficient cars.

The CARB implements the state's vehicle regulations through a vigorous certification process, as well as compliance and enforcement programs. It regularly tests vehicles to ensure compliance with air quality standards.

In 2004, VW settled a case with CARB for $552,500 for selling cars in California that had not been properly certified. VW admitted to selling 84 new 2002 vehicles from several retail locations throughout the state, attributed to an error in its electronic ordering system.

The EPA is expected to compel VW to issue a recall notice in order to remedy the current emissions problem, which could take up to a year after identifying the appropriate corrective action and a recall plan.

Volkswagen Tells Dealers To Halt Sales Of New TDI Cars Amid Diesel Cheating Scandal
Alanis King

Following the government investigation of Volkswagen's diesel emissions, The Detroit News reports the automaker ordered its U.S. dealerships to halt sales of new 2016 and remaining 2015 TDI car models with 2.0-liter diesel engines.

According to the Environmental Protection Agency and California Air Resources Board, VW dodged federal emissions requirements for some 482,000 of its diesel cars — including the Passat, Jetta, Golf, Beetle, SportWagens and Audi A3 — manufactured from 2009 to 2015. The models contain a "defeat device" which exists to detect when the car is under testing conditions, allowing for it to activate the full emissions-control systems only in those circumstances.

In other words, environmental officials say that the street cars are emitting between 10 and 40 times the amount of allowable nitrogen oxide pollution, which is not only illegal but harmful to both the environment and public.

The EPA is taking action on 2016 diesel models. Christopher Grundler, director of the EPA Office of Transportation of Air Quality, said that the government will not grant VW a "certificate of conformity" to sell the 2016 models with 2.0-liter diesel engines, meaning they cannot be sold.

VW dealers have been waiting for the 2016 models to replenish showrooms. Most U.S. VW dealers don't have any remaining 2015 diesel cars to sell.

VW is barred from selling 2016 model vehicles with the 2.0 liter diesel engine until "they get answers to the questions of how these vehicles are being operated. Volkswagen couldn't explain why we're getting these excess emissions," Grundler said.

Meanwhile, whatever 2015 models remain on lots have also been ordered not to be sold. As Automotive News notes, four-cylinder TDI models account for 20 to 25 percent of VW's U.S. sales, so this is going to hurt.

In addition, VW has ordered an outside investigation to find out what happened and "reverse the damage this has caused," CEO Martin Winterkorn said in an apologetic statement.

According to the EPA, the agency is now checking to see if other automakers are bypassing the laws on diesel engines as well.

While no official recall is underway just yet, the News reports:

EPA said VW violated federal law and, in theory, could face fines of up to $18 billion — $37,500 per vehicle — as well as criminal prosecution. Both agencies issued notices of non-compliance to VW Friday, a step necessary before ordering a recall.

The EPA will not take action to stop VW owners from driving their personal cars until a solution is made available, but VW did remove its "clean diesel" advertisements from YouTube and television.

CBC News (Canada):
http://www.cbc.ca/news/business/volkswagen-emissions-rigging-1.3236548

Volkswagen shares plunge on emissions rigging scandal
Consumer Reports suspends 'recommended' rating for Jetta and Passat diesels
CBC News Posted: Sep 21, 2015 9:00 AM ET Last Updated: Sep 21, 2015 9:00 AM ET

Volkswagen's CEO apologized but investors were not in a forgiving mood as the company's stock plunged almost 20 per cent Monday following revelations late last week that the automaker had rigged emissions tests for almost 500,000 diesel cars in the U.S.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Martin Winterkorn said in a weekend statement.

On Friday, the U.S. Environmental Protection Agency (EPA) revealed that half a million diesel-powered VWs had been programmed to bypass emission controls except during emissions tests. The cars include the Audi A3, VW Jetta, Beetle, Golf and Passat models made in the last seven years.

The EPA ordered VW to fix the cars and VW said it would co-operate with regulators. But the damage to the automaker's image is nothing less than catastrophic.

VW had marketed its diesel-powered cars as being better for the environment. The Associated Press reports, citing an anonymous source with knowledge of the matter, that VW has told dealers to stop selling its 2015 diesel cars with 2.0-litre engines.

The EPA said the VW cars under investigation seemed to pass emissions tests, but in the

real world, were actually emitting up to 40 times the national standard for nitrogen oxide, which is linked to asthma and lung illnesses.

Consumer Reports announced it would remove its "recommended" rating from the Jetta and Passat diesels until it can retest the vehicles.

VW could face fines of up to $18 billion US, according to the EPA.

Volkswagen shares plunged 19.4 per cent in Monday trading in Germany, chopping $21 billion Cdn from the market value of the company.

"The company will have to recall nearly 500,000 affected cars, which will cost it millions of dollars, and that's even before the damage to its brand and potential fines," said Michael Hewson, chief market analyst at CMC Markets.

Diesel-powered models account for about a quarter of VW's sales.

Impact in Canada unclear

At this point, it isn't clear what the revelations mean for owners of VW diesels in Canada. Volkswagen Canada told CBC News on Friday that it first learned of the EPA action earlier that morning. It said it would co-operate with Environment Canada "to understand the implications for the Canadian market and what actions, if any, may be required in Canada."

Environment Canada, for its part, said it was in talks with the EPA "to further examine this issue and assess potential implications for Canada." Environment Canada also said it collaborates on emissions verification activities with the U.S. EPA "to ensure our common environmental outcomes are achieved," and pointed out that its emissions standards are aligned with U.S. standards.

The EPA and Environment Canada both stressed that the effectiveness of a vehicle's air pollutant control devices is not a safety issue. The cars remain legal to drive.

Volkswagen to Stop Sales of Diesel Cars Involved in Recall

By JACK EWING and CORAL DAVENPORTSEPT. 20, 2015

FRANKFURT — Volkswagen said on Sunday that it would halt sales of cars in the United States equipped with the kind of diesel motors that had led regulators to accuse the German company of illegally installing software to evade standards for reducing smog.

John Schilling, a Volkswagen spokesman, said that the company would stop selling 2015 and 2016 Volkswagen and Audi models equipped with 4-cylinder turbo diesel engines, which the company has marketed as "clean diesel." The company will also stop selling used cars that have the engines, Mr. Schilling said.

He said he did not know how many models would be stuck on dealer lots as a result of the decision. Earlier this month, Volkswagen had said that 23 percent of new cars sold in August in the United States were diesels, or 7,400 vehicles.

The confirmation of the halt in sales came on the same day that Martin Winterkorn, the chief executive of Volkswagen, apologized for conduct that prompted the Environmental Protection Agency to order Volkswagen to recall nearly half a million vehicles.

An employee on the Audi A3 limousine. The recall involves four-cylinder Volkswagen and Audi vehicles from the model years 2009 to 2015. Credit Szilard Koszticsak/European Pressphoto Agency

Volkswagen could face billions of dollars in fines for what the E.P.A. said was a deliberate attempt to evade rules on emissions. The decision to stop sales was first reported by The Wall Street Journal.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Mr. Winterkorn said in a statement.

He said the company would "cooperate fully" with the authorities and order its own independent investigation into the accusations.

In his statement, Mr. Winterkorn did not contest assertions by the E.P.A. that Volkswagen sold cars equipped with software that could detect when periodic state government emissions testing was taking place.

Only during such tests are the cars' full emissions control systems turned on. During normal driving situations, the controls were turned off, allowing the cars to spew as much as 40 times the pollution allowed under the Clean Air Act, the E.P.A. said.

Diesel-driven cars have enjoyed something of a renaissance in recent years, shedding much of their old stigma for being dirty, clanky and sluggish to drive, said Karl Brauer, an analyst at Kelley Blue Book. And in the United States, he said, Volkswagen has clearly led the pack — offering diesel vehicles that performed just like their gasoline counterparts.

"Now, we have to wonder if the technology really advanced as far as we thought at VW,"

Mr. Brauer said. "They must have had a problem making it work in a way that delivered truly clean diesel. At least clean enough to meet the regulations."

Mr. Brauer said the higher nitrous oxide emissions probably allowed better drivability. Fuel economy also improves with more nitrous emissions, and engines can run cooler, and thus wear out more slowly.

"They must have had a mix of performance, economy and durability that they liked, but realized they couldn't achieve that and still get the emissions," he said.

Diesels in particular are known — and marketed — these days as having tremendous torque, or low-end thrust from a stop. If achieving the required emissions affected the torque, making it anemic, then "drivers are going to scratch their heads, thinking, isn't this why I got a diesel?" Mr. Brauer said.

Volkswagen was going through a difficult period even before the accusations became public on Friday. Mr. Winterkorn recently survived a power struggle with the chairman of Volkswagen's supervisory board, Ferdinand Piëch, a scion of the Porsche family who dominated the company for more than two decades before resigning in April.

Following Mr. Piëch's departure, some analysts have raised questions about whether Mr. Winterkorn would be strong enough to hold together the sprawling Volkswagen empire, which also includes Audi and Bentley luxury cars, Porsche and Lamborghini sports cars, Scania and MAN heavy trucks, and Ducati motorcycles.

Although Volkswagen recently surpassed Toyota as the world's biggest automaker measured by the number of cars sold, it is significantly less profitable than its Japanese rival and far weaker in the United States market.

A push by Volkswagen to increase sales in the United States, which included building a factory in Chattanooga, Tenn., to produce Passat sedans, has fallen short.

"For Volkswagen, it's a huge scandal," said Ferdinand Dudenhöffer, a professor at the University of Duisburg-Essen, who follows the automobile industry. "The timing is extremely unfortunate."

Professor Dudenhöffer said the case could damage all German automakers, which have tried to build acceptance in the United States for diesel engines, a sector in which they believe they have a technological lead.

Until recently, Professor Dudenhöffer said, the United States applied stricter standards to diesel engines than those applied by European regulators. But the European authorities, concerned about the health effects of diesel pollution, have tightened standards, prompting complaints from the auto industry.

Professor Dudenhöffer said that as a result of the E.P.A. action, Mr. Winterkorn could come

under pressure to resign.

"Winterkorn was already damaged," Professor Dudenhöffer said. "Now there is an accusation of illegal behavior. This story is not over."

E.P.A. officials issued the car company a notice of violation and said it had admitted to the use of a so-called defeat device.

The recall involves 4-cylinder Volkswagen and Audi vehicles from the model years 2009 to 2015.

The software was designed to conceal the cars' emission of nitrogen oxide, a pollutant that contributes to the creation of ozone and smog, which are linked to a range of health problems, including asthma attacks, other respiratory diseases and premature death.

Disengaging the pollution controls on a diesel-fueled car can yield better performance, including increased torque and acceleration.

California has issued a separate notice of violation to the company. California, the E.P.A. and the Justice Department are working together on an investigation of the allegations.

Over the next year, E.P.A. officials said, owners of the affected vehicles should expect to receive recall notices from Volkswagen, including information about how to get their cars repaired at no cost to them. The recall covers roughly 482,000 diesel passenger cars sold in the United States since 2009.

Affected diesel models include the 2009-15 Volkswagen Jetta, 2009-15 Beetle, 2009-15 Golf, 2014-15 Passat and 2009-15 Audi A3.

The American investigation could ultimately result in fines or penalties for the company. Under the terms of the Clean Air Act, the Justice Department could impose fines of as much as $37,500 for each recalled vehicle, for a possible total penalty of as much as $18 billion.

The notice of violation came days after the company promoted plans at the Frankfurt International Motor Show to introduce 20 plug-in hybrid or all-electric vehicles by 2020 as part of a campaign to reduce vehicle emissions.

Mr. Winterkorn said in his statement on Sunday that Volkswagen would "do everything necessary in order to reverse the damage this has caused."

"This matter has first priority for me, personally," he said, "and for our entire board of management."

VW apologises for cheating US car exhaust emissions tests
Andy Sharman in London

The chief executive of Volkswagen has apologised and ordered an external investigation into findings that the carmaker cheated on US emissions tests to make its vehicles appear less polluting.

In a statement on Sunday, Martin Winterkorn, chief executive of the German carmaker, said the board of management took the findings "very seriously".

He added: "I personally am deeply sorry that we have broken the trust of our customers and the public. We will co-operate fully with the responsible agencies, with transparency and urgency, to clearly, openly and completely establish all of the facts of this case."

The Environmental Protection Agency on Friday said diesel variants of several VW and Audi models sold in the US over six years — including the VW Passat, Beetle and Audi A3 — had been fitted with sophisticated algorithms designed to deceive the laboratory testing regime.

The authorities ordered VW to recall 482,000 cars because of the use of so-called defeat devices — which use software to detect when the car is being tested and runs treatments to reduce nitrogen oxides. Once out on the road, the cars were discovered to produce pollutants up to 40 times the legal limits.

The discovery leaves the German carmaker — which has admitted to using the defeat devices — potentially facing billions of dollars in fines and warranty costs, possible criminal charges for executives and class-action lawsuits from US drivers.

Mr Winterkorn did not say who would be carrying out the external investigation, and the company declined to provide further details.

It was Mr Winterkorn's first formal statement on an issue that also threatens to seriously undermine its attempts to turnround its sputtering performance in the US.

Max Warburton, analyst at Bernstein Research, said: "The best case for VW is probably still a multibillion-dollar fine, pariah status in the US with government — and possibly consumers — [and] damage to its leading position in diesel in the US."

VW now has to initiate a process to fix the cars' emissions systems, though the EPA has said the violations do not present a safety hazard and the vehicles remain legal to drive and resell. Owners of cars of models covering the 2009-2015 period do not need to take any action, the agency said.

I personally am deeply sorry that we have broken the trust of our customers and the public.

We will co-operate fully with the responsible agencies, with transparency and urgency, to clearly, openly, and completely establish all of the facts of this case
- Martin Winterkorn, VW chief

In addition to the costs of the recall campaign, VW could theoretically also face fines of up to $37,500 per vehicle — a total of more than $18bn — though analysts have said VW is likely to face a much lower penalty.

The case is a rare but not unique example of this type of manipulation by the motor industry. In 1998, a group of truckmakers including Navistar, Renault and Volvo paid more than $1bn to resolve claims they installed defeat devices on heavy duty diesel engines. These devices allowed an engine to pass the emissions test, but then turn off emission controls when on the road, the EPA said at the time.

The EPA has been active in the past year, securing a record $300m settlement with Hyundai and Kia over claims the Korean affiliates overstated the fuel economy of their cars.

The Guardian:
http://www.theguardian.com/business/2015/sep/20/vw-software-scandal-chief-apologises-for-breaking-public-trust

VW software scandal: chief apologises for breaking public trust
Martin Winterkorn orders external investigation after US regulators found cars gave inaccurate data on toxic emissions

Volkswagen has ordered an external investigation after US regulators found that the carmaker designed software for close to half a million diesel cars that gave false emissions data, its CEO said, adding he was "deeply sorry" for the violation of US rules.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Martin Winterkorn said in a statement published on Sunday by the carmaker on Sunday. "Volkswagen has ordered an external investigation of this matter."

The US Environmental Protection Agency (EPA) said on Friday the software deceived regulators measuring toxic emissions, adding that Volkswagen could face fines of up to $18bn (£11.5bn) as a result. The carmaker could face penalties of $37,500 for each car not in compliance with clean air rules. The diesel-powered models from 2009-2015 are the VW Jetta, Beetle and Golf, the Passat model from 2014-15, and the Audi A3 from 2009 to 2015.

"We do not and will not tolerate violations of any kind of our internal rules or of the law," said Winterkorn, adding the company was fully co-operating with the relevant agencies. He gave no details on who would carry out the external investigation.

Cynthia Giles, an enforcement officer at the EPA, said on Friday that the cars in question "contained software that turns off emissions controls when driving normally and turns them

on when the car is undergoing an emissions test".

"VW was concealing the facts from the EPA, the state of California and from consumers. We expected better from VW," she said. "Using a defeat device in cars to evade clean air standards is illegal and a threat to public health."

The EPA accused Volkswagen of using the device in 482,000 four-cyclinder Volkswagen and Audi diesel cars in the US since 2008. VW must recall all the cars, remove the defeat device and improve the cars' NOx emissions, which creates smog and has been linked to increased asthma attacks and other respiratory illnesses.

The feature, which the EPA called a defeat device, masks the true emissions only during testing and therefore when the cars are on the road they emit as much as 40 times the level of pollutants allowed under clean air rules meant to ensure public health is protected, said Giles.

Volkswagen suspended sales of cars containing the company's four-cylinder turbo direct injection (TDI) engine on Friday in light of the investigation. The "clean diesel" engine is commonly used in models including VW's Beetle, Golf, Jetta, Passat and the A3 luxury compact made by VW-owned Audi.

Richard Corey, executive officer of the California Air Resources Board (Carb), said on Friday: "Our goal now is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

The EPA and Carb discovered the defeat device software following independent analysis by researchers at West Virginia University, who were promoted into action by the International Council on Clean Technology, an NGO.

When confronted with the EPA and Carb's evidence, VW admitted that its cars were fitted with the defeat device.

The crackdown on Volkswagen comes as the Obama administration is attempting to cut air pollution from an array of sources, including the vehicle industry, power plants and oil and natural-gas providers. The EPA set new carbon rules for big trucks earlier this year and has told all vehicle makers they must sell light vehicles averaging 54.5 miles a gallon by 2025.

In Europe, new laws have forced manufacturers to test their cars under real world conditions and not in laboratories, helping to reduce unrealistic claims about emissions. By 2017 all new cars will have to be more stringently tested, effectively ending an era when car makers could exaggerate the performance of their machines.

UK car industry group the SMMT claims that, because of European legislation to cut tailpipe pollution, Britain's air quality is better now than it has been for centuries.

Volkswagen head apologizes after EPA accusations
By Timothy Cama - 09/20/15 01:28 PM EDT

The head of German automaker Volkswagen Group apologized Sunday after allegations surfaced that his company deliberately tried to evade United States air pollution laws.

Martin Winterkorn, the company's chief executive officer, said he was "deeply sorry" for violating the trust of customers and the public, and said that Volkswagen had ordered an external investigation into the matter.

Volkswagen faces up to $18 billion in fines for the violations under the Clean Air Act, under which the Environmental Protection Agency (EPA) sets air pollution rules for motor vehicles.

"We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly, and completely establish all of the facts of this case," Winterkorn said in a Sunday statement

"We do not and will not tolerate violations of any kind of our internal rules or of the law."

Winterkorn stopped short of admitting to the EPA's allegations.

On Friday, the EPA said it had discovered that about 482,000 diesel vehicles sold by VW and its subsidiary Audi in the United States had "defeat devices" that detect when the vehicle is undergoing an EPA emissions test and turn on equipment that controls output of nitrogen oxides to acceptable levels.

At all other times, the EPA said, the vehicles emitted more pollutants, sometimes exceeding allowable volumes by 40 times.

The agency has not yet officially charged Volkswagen with any civil or criminal penalties, nor did it order any recalls of the affected vehicles. California, which has its own emissions regulations, is also accusing the company of violating air rules.

"We at Volkswagen will do everything that must be done in order to re-establish the trust

that so many people have placed in us, and we will do everything necessary in order to reverse the damage this has caused," Winterkorn said, adding that the issue is the top priority for him and the entire management team.

Volkswagen could face $18 billion penalties from EPA
WASHINGTON | BY TIMOTHY GARDNER

Volkswagen AG could face penalties up to $18 billion after being accused of designing software for diesel cars that deceives regulators measuring toxic emissions, the U.S. Environmental Protection Agency said on Friday.

"Put simply, these cars contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test," Cynthia Giles, an enforcement officer at the EPA, told reporters in a teleconference.

Volkswagen can face civil penalties of $37,500 for each vehicle not in compliance with federal clean air rules. There are 482,000 four-cylinder VW and Audi diesel cars sold since 2008 involved in the allegations. If each car involved is found to be in noncompliance, the penalty could be $18 billion, an EPA official confirmed on the teleconference.

A U.S. Volkswagen spokesman said the company "is cooperating with the investigation; we are unable to comment further at this time."

The feature in question, which the EPA called a "defeat device," masks the true emissions only during testing and therefore when the cars are on the road they emit as much as 40 times the level of pollutants allowed under clean air rules meant to ensure public health is protected, Giles said.

The EPA accused Volkswagen of using software in four-cylinder Volkswagen and Audi diesel cars from model years 2009 to 2015 made to circumvent emissions testing of certain air pollutants.

The cars are not facing recall at this time, the EPA said.

The diesel-powered vehicles involved from the 2009 to 2015 model years are the VW Jetta, VW Beetle, VW Golf and the Audi A3, as well as the VW Passat from model years 2014 and 2015.

Christian Post:
http://www.christianpost.com/news/volkswagen-to-recall-almost-500000-cars-in-the-us-over-epa-violation-145778/

Volkswagen to recall almost 500,000 cars in the US over EPA violation
BY LORRAINE CABALLERO , CHRISTIAN POST CONTRIBUTOR

Volkswagen will recall almost 500,000 vehicles released from 2009 to 2015 in the United States after the carmaker allegedly violated the law by using illegal software, which helped it go past environmental restrictions.

The Environmental Protection Agency (EPA) said Volkswagen broke the law by installing a "defeat device" in Volkswagen and Audi units with four-cylinder turbo diesel engines released from the year 2009 to 2015. Under normal driving conditions, the emission control devices installed in the said cars worked with reduced efficacy, according to the Dispatch Times.

In the wake of the violation, Volkswagen chief executive Martin Winterkorn delivered a statement apologizing to their customers and vowing to cooperate with EPA's investigation. However, he did not deny the allegations regarding the illegal software, the International Business Times reports.

"I personally am deeply sorry that we have broken the trust of our customers and the public," said Winterkorn in his statement.

Because of the notice of violation from the EPA, Volkswagen is now facing penalties amounting to more than $18 billion, or around $37,500 per unit, based on the U.S.A. federal Clean Air Act. EPA and CARB discovered the illegal software after researchers at the West Virginia University conducted an independent study in cooperation with the global Council on Clean Transportation, the report adds.

Volkswagen has been struggling to sell cars in the United States because of the rising cases of asthma and other respiratory illnesses caused by air pollutants. The diesel vehicles affected by the recall were being counted on to pull up the company's sales in the United States.

Based on the findings of the EPA, Volkswagen had included a certain algorithm in the cars' emissions software that could detect when an emission test is being conducted.

Owners of the diesel cars affected by the recall will be notified by Volkswagen by next year, EPA said. Until Consumer Reports can "retest" the said cars, the recommended rating for the Passat, Jetta, Golf, Beetle, and Audi A3 luxury compact will remain on hold, the report relays.

AP (via Boston Globe):
https://www.bostonglobe.com/business/2015/09/20/chief-sorry-after-epa-says-firm-skirted-clean-air-law/3NNTCf2cVxUI1qYNBfMe7L/story.html

Volkswagen chief apologizes for rigging tests of emissions
By Paul Wiseman and Tom Krisher ASSOCIATED PRESS SEPTEMBER 21, 2015

WASHINGTON — The chief executive of Volkswagen apologized Sunday and VW customers said they felt duped after the Environmental Protection Agency revealed that the German automaker had skirted clean air rules by rigging emissions tests for about 500,000 diesel cars.

''I personally am deeply sorry that we have broken the trust of our customers and the public,'' Volkswagen chief Martin Winterkorn said in a statement. He said VW has ordered an investigation and promised that the company would cooperate with regulators.

On Friday, the EPA said VW used software that allowed its diesel cars to release fewer smog-causing pollutants during tests than in real-world driving conditions.

The cars, built in the last seven years, include the Audi A3, VW Jetta, Beetle, Golf, and Passat models. The agency ordered VW to fix the cars at its own expense. VW also faces fines that could add up to billions of dollars.

VW edged out Toyota to become the world's top-selling automaker in the first half of 2015. But a hit to its reputation from the emissions revelations could hamper its efforts at a sales rebound in the United States. Between 2013 and 2014, VW sales plummeted 10 percent, even as overall industry sales rose 6 percent. US buyers want SUVs, and Volkswagen doesn't have competitive vehicles to offer them.

The magazine Consumer Reports almost immediately suspended its ''recommended'' rating on the Jetta and Passat diesels until it can get recall repairs and retest the cars.

Volkswagen marketed the diesel-powered cars, which account for about 25 percent of its sales, as being better for the environment. After the EPA acted, VW withdrew ads for its diesel cars from Youtube.com and asked dealers to stop selling 2015 diesel cars with 2.0-liter engines, according to a person familiar with the matter.

Some VW customers were furious.

Zeeshan Shah, 39, of Fulton, Md., said that he bought a Volkswagen Diesel Passat 2015 in July after he totaled his Jetta two years ago.

''The selling point" for the Diesel Passat was that the technology was so good, he said.

Now, Shah plans to return the car back to the dealer to have it examined and doesn't want to buy another Volkswagen. ''Once they cheat you on this issue, what other issues can they cheat you on?'' he said. ''You don't trust them.''

John German, senior fellow at the International Council on Clean Transportation, the group that blew the whistle on VW, said it didn't expect to find any violators when it contracted with West Virginia University to test cars with diesel engines.

The council, a research group that helps governments write regulations, did the US tests in an effort to show that automakers were complying with US nitrogen oxide emissions standards, which are stricter than in other countries, he said.

The EPA said VW faces fines of up to $37,500 per vehicle for the violations, a total of more than $18 billion.

Volkswagen Halts U.S. Sales of Certain Diesel Cars
Auto maker also begins external probe after EPA accuses company of dodging emissions rules
By WILLIAM BOSTON, AMY HARDER and MIKE SPECTOR
Updated Sept. 20, 2015 8:57 p.m. ET

Volkswagen AG's crisis over allegedly cheating on U.S. emissions tests deepened, with the German auto maker halting American sales of popular diesel-powered cars and issuing a sweeping apology for violating customers' trust.

It also launched an external investigation. Shares in the company slumped more than 20% in early trading Monday in response to the crisis.

The company could face billions of dollars in fines and the crisis could further weaken Volkswagen Chief Executive Martin Winterkorn's position. He narrowly survived efforts by a major shareholder to oust him earlier this year and was passed over for the chairman's job, the company's top post, this month.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Mr. Winterkorn said in a statement issued by the company on Sunday, adding that VW is cooperating with authorities and has commissioned an external probe.

The U.S. is crucial in Volkswagen's efforts to become the world's leading auto maker by sales. The German company has built its campaign to grow in the U.S. market on a promise that its clean-diesel engines deliver better performance and low emissions. It is neck-and-neck with reigning sales leader Toyota Motor Corp. and overtook the Japanese car maker during the first half of this year. But the emissions test probes could stall its progress.

Even prior to the emissions issue, the auto maker's namesake Volkswagen brand has been battling declining sales in the U.S. market. And Audi AG, its luxury car maker, is finding it hard to catch up in the U.S. with rivals BMW AG and Daimler AG, which makes Mercedes-Benz vehicles.

On Friday, the U.S. Environmental Protection Agency and the California Air Resources Board alleged that Volkswagen used software, dubbed a "defeat device," in the cars to make diesel-powered engines appear to have lower levels of emissions than they actually did.

About 482,000 Volkswagen diesel-powered cars were affected.

The EPA probe could force Volkswagen and its Audi unit to recall thousands of vehicles that contain the company's "clean diesel" engines. The four-cylinder 2.0-liter turbo direct injection, or TDI, engine is commonly found in Volkswagen's Passat, Jetta, Golf, Beetle and in Audi's A3 luxury compact model.

A Volkswagen spokesman on Sunday said the auto maker halted the sale of all 2015 and 2016 models containing the four-cylinder 2.0 liter TDI engine. The EPA investigation affects cars sold since 2008. The company hasn't issued a recall, the spokesman said.

Realization that Volkswagen may have cheated to get better emissions results could undermine its U.S. recovery and further weaken its shares, which are down 37% from their peak on March 16, said analysts.

"There is no way to put an optimistic spin on this—this is really serious," said Max Warburton, an analyst with Bernstein Research. "The best case for VW is probably still a multi-billion dollar fine."

Consumer Reports, an influential magazine when it comes to car reviews, last week suspended "recommended" ratings on the auto maker's Jetta and Passat diesel-engine models after the EPA disclosed its allegations. Consumer Reports said the recommendations would be suspended until it can retest the vehicles once they are repaired. The magazine said it would then assess whether the cars' fuel economy worsened.

A production line at a Volkswagen plant in Wolfsburg, Germany. ENLARGE
A production line at a Volkswagen plant in Wolfsburg, Germany. PHOTO: REUTERS
Laurie Cleveland, a 54-year-old English teacher from Lowville, N.Y., said she bought a new 2015 VW Passat TDI over the Labor Day weekend. She isn't sure what to do now. She said it is her fourth Volkswagen diesel car since 2006.

"I feel like I've been deceived," she said. "I'm a person who likes to be environmentally friendly," she added.

Mr. Winterkorn on Sunday vowed to do "everything necessary" to regain public trust in the

company.

"We do not and will not tolerate violation of any kind of our internal rules or of the law," he said. "This matter has first priority for me."

U.S. officials said Volkswagen violated two parts of the federal Clean Air Act and could face fines of as much as $37,500 per car, or more than $18 billion. It remained unclear whether the government would seek such an onerous penalty.

The EPA in November 2014 hit South Korean auto makers Hyundai Motor Co. and Kia Motors Corp. with a record $100 million penalty for overstating fuel-economy claims and forced the companies to cough up another $200 million in regulatory credits.

The EPA has said the vehicles remain safe and legal to drive. The agency is working with the Justice Department and an investigation is continuing.

Officials alleged that Volkswagen used software that activates full emissions controls only during testing but then reduces their effectiveness during normal driving. The result is that cars can emit nitrogen oxides at up to 40 times the allowable standard, the agency said. Diesel-powered cars are a small part of overall U.S. car and light-truck sales.

Experts say that the software enables cars to get better fuel economy at the expense of higher nitrogen-oxide emissions, which was likely one reason VW was using them, according to Margo Oge, who recently retired as director of the EPA's Office of Transportation and Air Quality after more than 30 years at the agency.

Volkswagen's apparent motivations on the emissions tests were unclear. An EPA spokeswoman has said it would be "premature to speculate on why VW did this."

A Volkswagen spokesman in Wolfsburg, Germany, on Sunday said, "We are now in the investigation phase and have no comment beyond what is in the statement that we published today."

California is separately investigating the auto maker.

The International Council on Clean Transportation, a nonprofit research organization that works with governments to cut air pollution from mobile sources, and West Virginia University researchers uncovered Volkswagen's alleged use of defeat devices in research and testing over the last couple of years.

Volkswagen to halt U.S. sales of some 2015 diesel cars

FRANKFURT/HAMBURG | BY CHRISTOPH STEITZ AND JAN SCHWARTZ

Volkswagen (VOWG_p.DE) told U.S. dealers to halt sales of some 2015 diesel cars after regulators found software it designed for the affected vehicles gave false emissions data, the company said Sunday, announcing it had launched an investigation.

In a statement published by the carmaker on Sunday, Chief Executive Officer Martin Winterkorn said, "I personally am deeply sorry that we have broken the trust of our customers.

"Volkswagen has ordered an external investigation of this matter," he said.

The U.S. Environmental Protection Agency (EPA) said on Friday the software deceived regulators measuring toxic emissions, adding that Volkswagen could face fines of up to $18 billion as a result.

The Detroit News reported late Friday that VW dealers still had some 2015 diesel Jetta, Passat and Beetle cars for sale.

A VW representative on Sunday confirmed the partial halt of sales of the affected vehicles but did not give any numbers.

Winterkorn said, "We do not and will not tolerate violations of any kind of our internal rules or of the law," adding that the company was fully cooperating with the relevant agencies.

He gave no details on who would carry out the external investigation.

"This is not your usual recall issue, an error in calibration or even a serious safety flaw," Bernstein analysts wrote in a note on Sunday. "There is no way to put an optimistic spin on this - this is really serious."

Cynthia Giles, an enforcement officer at the EPA, said on Friday the cars in question "contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test".

The feature, which the EPA called a "defeat device," masks the true emissions only during testing. When the cars are on the road, they emit as much as 40 times the level of pollutants allowed under clean air rules meant to ensure public health is protected, Giles said.

"We have admitted to it to the regulator. It is true. We are actively cooperating with the regulator," a Volkswagen spokesman said on Sunday.

Volkswagen could face civil penalties of $37,500 for each vehicle not in compliance with federal clean air rules. Some 482,000 four-cylinder VW and Audi diesel cars sold since 2008 are involved in the allegations.

If each car involved is found to be in noncompliance, the penalty could be $18 billion, an EPA official confirmed during the telephone conference on Friday.

Volkswagen peer Daimler, meanwhile, signaled it may not be subject to the same violation.

"I have a rough idea of what is happening and that it does not apply to us," Daimler Chief Executive Dieter Zetsche said on Sunday at an event in Hamburg.

"But it is much too early to make a final statement on this," he added.

USA Today:
http://www.usatoday.com/story/money/cars/2015/09/20/volkswagen-ceo-martin-winterkorn-apologizes-epa-clean-air-act-emissions-violations/72519678/

Volkswagen issues sales halt; CEO apologizes on emissions cheating
Nathan Bomey, USA TODAY 8:02 a.m. EDT September 21, 2015

Volkswagen has admitted cheating U.S. diesel emissions tests, sending company shares plunging as much as 23 percent in Frankfurt and potentially leaving the company open to billions of dollars in fines. Bloomberg

Martin Winterkorn ordered an external investigation after the EPA disclosed the violations.

Volkswagen's CEO said he is "deeply sorry" for violating U.S. emissions standards and ordered an external investigation Sunday, two days after the Environmental Protection Agency (EPA) accused the automaker of purposefully manipulating emissions tests for almost 500,000 vehicles.

The German automaker ordered its U.S. dealerships to stop selling cars impacted by the probe until its engineers can deliver a fix.

The EPA accused Volkswagen of installing software on 482,000 diesel cars in the USA that allowed it to cheat emissions tests, potentially exposing people to harmful pollutants at levels of 40 times the acceptable standard and respiratory conditions such as asthma.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Martin Winterkorn, Volkswagen's CEO, said in a statement. "We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly and completely establish all of the facts of this case." Winterkorn pledged to regain the public's trust.

The violations could expose Volkswagen — the world's largest vehicle manufacturer through the first six months of 2015 — to up to $18 billion in federal fines if the EPA assesses the maximum possible penalty of $37,500 per vehicle.

The violations could invite charges of false marketing by regulators, a vehicle recall and payment to car owners, either voluntarily or through lawsuits. Volkswagen advertised the cars under the "Clean Diesel" moniker.

The state of California is investigating the emissions violations.

"We do not and will not tolerate violations of any kind of our internal rules or of the law," Winterkorn said. The company's board takes the allegations "very seriously," he said.

The EPA accused the German automaker of adopting what it called a "defeat device" to trick U.S. regulators into believing its cars met Clean Air Act standards for nitrogen oxides. Volkswagen admitted to investigators it had installed the defeat device, the EPA said.

The EPA said impacted cars include the 2009 to 2014 Volkswagen Jetta, Beetle and Golf, the 2014 and 2015 Volkswagen Passat and the 2009 to 2015 Audi A3.

Volkswagen told dealers they cannot sell the 4-cylinder diesel versions of those cars until a fix is available, Volkswagen spokesman Mario Guerreiro said Sunday.

The sales halt could put a significant dent in the company's September sales performance. About 20% of Volkswagen's vehicle sales are diesel engines, said AutoPacific analyst Dave Sullivan.

"It totally goes against all of the marketing they have had of a clean diesel," Sullivan said of the violations. "That's one of the biggest selling points for Volkswagen."

"The trust of our customers and the public is and continues to be our most important asset," Winterkorn said Sunday. "We at Volkswagen will do everything that must be done in order to re-establish the trust that so many people have placed in us, and we will do everything necessary in order to reverse the damage this has caused. This matter has first priority for me, personally, and for our entire Board of Management."

Regulators order Volkswagen recalls over device used to trick smog tests
BY DALE KASLER

In a joint probe with California air regulators, the federal government Friday told Volkswagen to recall 480,000 diesel-fuel cars, charging the automaker with equipping the cars with software designed to circumvent pollution limits.

The U.S. Environmental Protection Agency and California Air Resources Board sent notices to the German automaker over its alleged use of something called a "defeat device," a piece of software that controls emissions during smog tests but not when the vehicles are actually on the road.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, assistant EPA administrator, in a prepared statement. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules."

The EPA sent Volkswagen a "notice of violation" and told car owners they can expect a recall notice. The agency said all repairs will be done at Volkswagen's expense. It added that the cars are safe to drive. The EPA has the authority to order automotive recalls.

Stanley Young, a spokesman for the ARB, said the federal and state agencies were first notified of the problem by independent researchers at West Virginia University and the International Council on Clean Transportation. Months of followup testing, including tests at an ARB lab in El Monte, confirmed the analyses.

Volkswagen officials in early September "admitted to CARB and EPA staff that these vehicles were designed and manufactured with a defeat device," according to an enforcement letter the California agency sent Friday to Volkswagen officials.

Young said "our major goal is to ensure that these cars come into compliance, that they're the same in the real world as they are on the test bench." The automaker eventually could face fines or other enforcement actions, he said.

The agencies plan to "dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action," said Richard Corey, executive officer of ARB, in a prepared statement.

The EPA said the recall affects VW Jettas, Beetles, Golfs and Audi A3s made in the 2009 to 2015 model years. It also covers VW Passats made in the 2014 and 2015 model years. Only diesel cars are affected. Young said ARB believes there are as many as 50,000 affected vehicles on the road in California.

Under the federal Clean Air Act, California has the authority to set its own regulatory standards for car emissions.

Volkswagen of America spokesman Darryll Harrison Jr. said the company is cooperating with the federal and state agencies but had no further comment.

The Atlantic:
http://www.theatlantic.com/technology/archive/2015/09/volkswagens-game-of-make-belief/406159/

Volkswagen's Game of Make-Believe
The company inserted a device into almost 500,000 cars meant to trick emissions testing, the EPA says.
ROBINSON MEYER

One of the great lessons of the pioneering computer scientist Alan Turing is this: Computers are only pretending machines. Software is always just imitating something else.

Volkswagen seems to have taken this maxim to new heights. The Environmental Protection Agency alleges that the company installed "defeat devices" in its four-cylinder Volkswagen and Audi-brand diesel cars from 2009 to 2015.

These devices, essentially, let the cars pretend to not break the law. The software could sense when the car was undergoing emissions testing and activate its pollution-control systems accordingly. When the car was being driven during normal use, these systems largely did not activate—making the car a much heavier polluter in real-life than it looked on paper.

With those systems deactivated, the car's emissions violated the Clean Air Act and California's state pollution-control regulation.

"Using a defeat device in cars to evade clean-air standards is illegal and a threat to public health," said Cynthia Giles, assistant administrator for the EPA's Office of Enforcement and Compliance Assurance, in a statement.

There are almost 500,000 vehicles on American roads with the devices installed, according to the EPA. Volkswagen must now pay to repair the emissions systems in affected cars. The government may also fine the company as much as $18 billion.

The device was discovered by researchers at West Virginia University, who notified the EPA and California state authorities. The two authorities investigated further, and after demanding "an explanation for the identified emission problems, Volkswagen admitted that the cars contained defeat devices," said a statement from the agency.

I reached out to Volkswagen for comment and haven't heard back yet. The Times reports

that the company is complying with investigations.

Volkswagen urged to recall cars for allegedly cheating emissions test
BY CHRIS PERKINS

Automakers are under intense pressure to meet emissions regulations put in place by the world's governments. Volkswagen allegedly had a slightly different solution.

The U.S. Environmental Protection Agency (EPA) ordered a recall of almost 500,000 Volkswagen and Audi vehicles equipped with four-cylinder diesel engines, for software designed to sidestep emissions regulations, reports the New York Times.

In total, 482,000 vehicles are being implicated, including the 2009-2015 Volkswagen Golf, Beetle, Jetta and Beetle, the 2014-2015 Volkswagen Passat and the 2009-2015 Audi A3. The cars were possibly installed with a "defeat device," a piece of software designed to detect when the car is undergoing emissions testing and turn on all of the car's emissions control systems then. In normal driving, the systems would turn off, causing 40 times larger nitrogen oxide emissions, according to the E.P.A.

Nitrogen oxide is a major contributor to smog, which can lead to increased respiratory problems and premature death.

The installation of this software is in violation of the Clean Air Act, and as such, the E.P.A, the State of California and the Department of Justice will launch an investigation. The installation of this software is in violation of the Clean Air Act, and as such, the E.P.A, the State of California and the Department of Justice will launch an investigation.

U.S. regulators hope that this recall will send a message to automakers to not develop software to skirt regulations. Last November, Hyundai and Kia were fined $100 million for violating the Clean Air Act. The two companies inflated their fuel economy figures for their 2012 vehicles.

The likely reason why Volkswagen could go the trouble to develop and use software like this is to boost performance; emissions control equipment tends to suck power out of an engine.

Researchers from West Virginia University, working with the International Council on Clean Transportation, discovered the software, according to the EPA's press release.

"Volkswagen Group of America, Inc., Volkswagen AG and Audi AG received today notice from the US Environmental Protection Agency, US Department of Justice and the California Air Resources Board of an investigation related to certain emissions compliance matters. VW is cooperating with the investigation; we are unable to comment further at this time," said a representative for Volkswagen.

A representative for the EPA wasn't immediately available for comment.

It's unclear if this issue only pertains to U.S. model Volkswagens and Audis equipped with four-cylinder diesels, or their world-market counterparts as well.

A report from Jalopnik notes that all of Volkswagen's ads for its diesel models have been deleted from YouTube, apparently at the company's request.

Why the EPA is forcing Volkswagen to recall nearly 500,000 cars
Volkswagen AG, the German car manufacturer, is under investigation by California and US emissions regulators for allegedly circumventing emission tests with a new device.
By Corey Fedde, Staff SEPTEMBER 18, 2015

Volkswagen AG is under investigation for circumventing clean air rules.

German automotive company Volkswagen AG is under investigation by California and US environmental regulators. The US Environmental Protection Agency told Reuters Volkswagen allegedly used software to circumvent emissions testing of specific air pollutants.

“Put simply, these cars contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test,” Cynthia Giles, an EPA enforcement officer, told Reuters via teleconference.

The feature, known as a “defeat device,” is allegedly present in 4 cylinder Volkswagen and

Audi vehicles from 2009-2015, which total nearly 500,000 vehicles. The device is programmed to detect when the car is undergoing an emissions test and turn on the full emissions controls. The device then turns the emission controls off during normal driving. The result being far more pollution than the company reported, the EPA told The New York Times.

The pollutant the "defeat device" is designed to conceal, nitrogen oxide, has been linked by public health officials to variety of health problems, including asthma.

The 500,000 diesel vehicle models affected include 2009-2015 Volkswagen Jettas, Beetles, Golfs, Passats, and Audi A3s.

The violation and investigation belie a growing trend in more aggressive environmental enforcement from federal regulators. In November 2014, the administration announced its largest ever penalty for a violation of the Clean Air Act on Korean automakers Hyundai Motor and Kia Motors. The fine involved a $300 million settlement for overstating vehicle fuel-economy standards on more than 1 million cars.

According to The New York Times, analysts say the crackdown is meant to send a clear message to automakers that circumventing federal rules will not be tolerated.

California, the EPA, and the Justice Department are working together on the investigation.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health. Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. E.P.A. will continue to investigate these very serious violations," Ms. Giles told the Times.

This report includes material from Reuters.

Volkswagen could face $18 billion penalties from EPA
WASHINGTON | BY TIMOTHY GARDNER

Volkswagen AG (VOWG_p.DE) could face penalties up to $18 billion after being accused of designing software for diesel cars that deceives regulators measuring toxic emissions, the

U.S. Environmental Protection Agency said on Friday.

"Put simply, these cars contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test," Cynthia Giles, an enforcement officer at the EPA, told reporters in a teleconference.

Volkswagen can face civil penalties of $37,500 for each vehicle not in compliance with federal clean air rules. There are 482,000 four-cylinder VW and Audi diesel cars sold since 2008 involved in the allegations. If each car involved is found to be in noncompliance, the penalty could be $18 billion, an EPA official confirmed on the teleconference.

A U.S. Volkswagen spokesman said the company "is cooperating with the investigation; we are unable to comment further at this time."

The feature in question, which the EPA called a "defeat device," masks the true emissions only during testing and therefore when the cars are on the road they emit as much as 40 times the level of pollutants allowed under clean air rules meant to ensure public health is protected, Giles said.

The EPA accused Volkswagen of using software in four-cylinder Volkswagen and Audi diesel cars from model years 2009 to 2015 made to circumvent emissions testing of certain air pollutants.

The cars are not facing recall at this time, the EPA said.

The diesel-powered vehicles involved from the 2009 to 2015 model years are the VW Jetta, VW Beetle, VW Golf and the Audi A3, as well as the VW Passat from model years 2014 and 2015.

Feds accuse VW of going around federal emissions standards
By Devin Henry - 09/18/15 12:50 PM EDT

The Environmental Protection Agency (EPA) is accusing Volkswagen of looking to circumvent federal air pollutant emission standards for the last six years.

EPA officials alleged Friday that about 482,000 VW vehicles sold since 2008 violate the Clean Air Act due to software installed on the vehicles that turns off required air pollution protections.

Janet McCabe, an acting assistant administrator, said the EPA "intends to hold VW responsible to recall the vehicles" and fix the emissions problem. The company could face up to an $18 billion fine for the violations.

The EPA issued VW a Clean Air Act violation notice Friday, alleging it used a software algorithm on certain vehicles that would turn on emission controls only when they undergo official emissions testing.

This "defeat device," the EPA said, would switch off those controls during normal operation, which means the vehicles could emit up to 40 times the amount of nitrogen oxide allowed under federal air pollution standards.

"These violations are very serious … not only because they result in excess emissions, but also because VW was concealing the fact from EPA, the state of California and from consumers," Assistant Administrator Cynthia Giles said. "We expected better from VW."

Federal law requires manufacturers to certify to the EPA that their cars meet emissions standards before selling their vehicles in the U.S. Cars with defeat devices cannot be certified, the EPA said.

A VW statement said only that the company had received the violation notice and is cooperating with the investigation.

The EPA and the California Air Resources Board discovered the defeat device during an analysis at West Virginia State University, the EPA said. Officials said their investigation into the incident is ongoing and wouldn't give many more details about how it developed or what the outcome might be.

The agency is not ordering a recall or announcing penalties at the moment, and officials said the cars are safe and legal to drive. The Friday announcement, Giles said, was meant to "inform the public right away and to put VW on notice of our continuing investigation."

The EPA said the announcement covers VW Jettas, Beetles, Golfs and Audi A3s with model years between 2009 and 2015, as well as the VW Passat with model years 2014 and 2015.

Volkswagen ordered to recall almost a half-million cars over emissions trick
by Benjamin Snyder

The Environmental Protection Agency is ordering Volkswagen to recall nearly a half-million cars after the company allegedly used a computer software trick to make the cars seem more environmentally friendly during state emissions tests.

The VW models involved include the diesel versions of the following models: The 2009-15 Volkswagen Jetta, the 2009–15 Beetle, the 2009–15 Golf, the 2014-15 Passat and the 2009-15 Audi A3. The recall affects 482,000 vehicles in total.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, Assistant Administrator for the Office of Enforcement and Compliance Assurance, in a statement. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

"Volkswagen Group of America, Inc., Volkswagen AG and Audi AG received today notice from the US Environmental Protection Agency, US Department of Justice and the California Air Resources Board of an investigation related to certain emissions compliance matters," Volkswagen says. "VW is cooperating with the investigation; we are unable to comment further at this time."

Volkswagen Used Illegal Software to Cheat Emissions Tests: EPA
By Stephen Elmer Sep 18, 2015

Volkswagen may be forced to recall almost 500,000 diesel passenger cars after an investigation revealed illegal software was allowing the vehicles to pass government emissions standards.

A software algorithm, known as a defeat device, used on roughly 482,000 Volkswagen vehicles with four-cylinder diesel engines is able to detect when the car is undergoing official emissions testing, and will activate full emissions controls only during the test.

The EPA says that this results in cars that meet emissions standards while being tested, but emit 40 percent more nitrogen oxides while driving.

Independent analysis at West Virginia University uncovered the defeat devices. After being questioned by the EPA and CARB, Volkswagen admitted that its cars did contain defeat devices.

The EPA says "it is incumbent" on Volkswagen to initiate a recall fix for all the affected cars, although they note that these vehicles are still safe to drive and do not present a safety

hazard at this time.

Volkswagen may be liable for civil penalties over the findings, which could total up to $18 billion if the EPA leverages its maximum find of $37,500 per vehicles.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, Assistant Administrator for the Office of Enforcement and Compliance Assurance. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

Models affected by the issue include the 2009-2015 Volkswagen Jetta, Beetle and Gold. The 2009-2015 Audi A3 is also affected, along with the 2014-2015 Passat.

Volkswagen acknowledged that it has received notice of the investigation. "VW is cooperating with the investigation; we are unable to comment further at this time," said the brand.

EPA: Volkswagen used 'defeat device' to circumvent air pollution controls
By Joby Warrick September 18 at 1:04 PM

The Environmental Protection Agency on Friday accused Volkswagen of installing a software "defeat device" that circumvented pollution controls on nearly a half-million Volkswagens and Audis.

The regulatory agency filed a notice of violation against the German automaker, saying the company deliberately cheated on clean-air rules by installing the software of five of its models since 2008. An EPA statement warned of possible civil penalties and hinted of a future possible recall, saying it was "incumbent on Volkswagen to initiate the process" to fix the affected cars' emissions systems.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, the EPA's assistant administrator for EPA's Office of Enforcement and Compliance Assurance.

EPA officials, in a joint probe with California's regulatory agency, determined that Volkswagen had inserted a sophisticated algorithm in the cars' emissions software that could detect when a vehicle was undergoing emissions testing. The software, which the EPA called a "defeat device," would turn on full emissions controls during testing, and switch them off again under normal driving conditions.

As a result, the cars emitted far more pollution–up to 40 times the federal standard for the pollutant known as NOx, a component in urban smog, the EPA said.

The software was installed in Volkwagen's Golfs, Jettas and Beetles and Audi A3s beginning in the model year 2009, and in Volkswagen's Passat models beginning in 2014. EPA officials said no action was required by owners of the car, but they suggested that Volkswagen would be compelled to address the problem.

"Our goal now is to ensure that the affected cars are brought into compliance, said Richard Corey, the executive officer for California's Air Resources Board." He said federal and state agencies intended to "dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

EPA Accuses Volkswagen of Dodging Emissions Rules
Agency says German auto maker circumvented air-pollution standards with software
By AMY HARDER

WASHINGTON—The U.S. Environmental Protection Agency issued a notice on Friday alleging that Volkswagen AG circumvented air-pollution standards with software installed on nearly a half million cars sold in the U.S. since 2008.

Officials said Volkswagen could face penalties of up to $37,500 per vehicle, or a total of more than $18 billion, though it remained unclear whether the government would eventually levy such a large penalty. Officials said the German auto maker violated the federal Clean Air Act.

The agency said that owners of these cars don't need to take any action right now and that while the cars have emissions exceeding federal standards, "these violations do not present a safety hazard and the cars remain legal to drive," according to the EPA.

Officials said a recall hasn't been announced and an investigation continues. They plan to at some point order Volkswagen to fix the vehicles, officials said.

Top EPA officials made the announcement alongside the California Air Resources Board, which is separately investigating the alleged use of the software, which EPA describes as a "defeat device." The software reduces the effectiveness of a car's emission control system during normal driving conditions and enables the car to emit nitrogen oxides at up to 40 times the allowable standard, according to the EPA.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, Assistant Administrator for the Office of Enforcement and Compliance at the EPA.

"Volkswagen Group of America Inc., Volkswagen AG and Audi AG received today notice from the U.S. Environmental Protection Agency, U.S. Department of Justice and the California Air Resources Board of an investigation related to certain emissions compliance matters," Volkswagen said in a statement. "VW is cooperating with the investigation; we are unable to comment further at this time."

EPA said that its allegations cover roughly 482,000 diesel passenger cars with model years between 2009 and 2015 and sold in the U.S. since 2008. They include the following models: the Jetta, Beetle, Audi A3, Golf and Passat.

The Clean Air Act requires vehicle manufacturers to certify to EPA that their products meet federal air-pollution standards. EPA said Friday that by making and selling vehicles with the "defeat device" software, Volkswagen was violating two parts of the Clean Air Act.

Volkswagen Used 'Defeat Device' To Skirt Emissions Rules, EPA Says
BILL CHAPPELL

Saying Volkswagen violated the Clean Air Act, the Environmental Protection Agency says the company's diesel-powered cars have sophisticated software that detects emissions testing – and "turns full emissions controls on only during the test."

Installed on four-cylinder cars, the software, which the EPA calls a "defeat device" that's meant to trick official tests, allowed diesel Jettas, Beetles, and other cars to "emit up to 40 times more pollution" than allowed under U.S. emission standards.

The agency says that after the carmaker was confronted with emission test results this month, it admitted that the cars contain defeat devices.

Volkswagen must now fix the cars' emissions control systems, the agency says, adding that Volkswagen could be liable for civil penalties and other punishment. The cars in question are popular Volkswagen and Audi models that were made from 2009 to this year.

The affected diesel cars include:

- Jetta (Model Years 2009 – 2015)
- Beetle (Model Years 2009 – 2015)
- Audi A3 (Model Years 2009 – 2015)
- Golf (Model Years 2009 – 2015)
- Passat (Model Years 2014-2015)

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, assistant administrator for the Office of Enforcement and Compliance Assurance.

The Verge:
http://www.theverge.com/2015/9/18/9352757/epa-volkswagen-recall-emissions

Volkswagen ordered to recall 500,000 cars for gaming emissions testing
By Colin Lecher

The federal government has ordered Volkswagen to recall almost 500,000 vehicles, saying the company unlawfully used special software to get around missions regulations.

VOLKSWAGEN ALLEGEDLY USED A "DEFEAT DEVICE."

Volkswagen allegedly used a so-called "defeat device" on certain models made in the past six years. The device works by only turning on emissions control when undergoing emissions testing, but not when the car is actually being driven normally and pollution is at its peak. "This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the standard," the EPA said in a statement.

Using such a device is a violation of the Clean Air Act, which, as The New York Times points out, the EPA has been increasingly cracking down on. In November, the agency hit Hyundai and Kia with a record $100 million fine for violations under the act.

The cars affected by the recall include the 2009 to 2015 Jetta, Beetle, Golf, and Audi A3. The 2014 and 2015 Passat is also included. According to the EPA, that adds up to 482,000 cars.

Jalopnik:
http://jalopnik.com/epa-orders-volkswagen-to-recall-482-000-diesel-cars-for-1731665972

EPA Orders Volkswagen To Recall 482,000 Diesel Cars For Cheating On Emissions
Patrick George

The New York Times reports Volkswagen has been ordered by the Environmental Protection Agency to recall 482,000 diesel cars in the U.S. over software they say was intentionally designed to circumvent smog regulations.

The cars, all diesels from 2009 to 2015, have a "defeat device" programmed to detect when the car is undergoing official emissions testing that only then turns on the full emissions control systems, the Times reports.

These controls are turned off in other situations, leading to far greater emissions than VW let on — which is against the law. The devices were designed to conceal nitrogen oxide emissions.

It's not immediately clear why VW had such a system on these cars, how the system detected official testing versus normal driving, or if the cars operated differently in normal driving when the defeat device was off. What effect did reducing NOx emissions have on fuel economy or performance?

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, the E.P.A.'s assistant administrator for the Office of Enforcement and Compliance. "Working closely with the California Air Resources Board, E.P.A. is committed to making sure that all automakers play by the same rules. E.P.A. will continue to investigate these very serious violations."
The state of California and the Justice Department are also investigating the violation, the paper reports.

The vehicles affected are the 2009-2015 diesel Jetta, Beetle, Golf, Passat and Audi A3.

More on this as we get it.

EPA: Volkswagen used software to skirt emissions rules
By Greg Gardner

The U.S. Environmental Protection Agency and California are accusing Volkswagen of violating the Clean Air Act by using software that allows hundred of thousands of VW and Audi diesel-powered cars to get around emission standards.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, EPA assistant administrator for enforcement and compliance assurance. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

The agency's notice of violation covers about 482,000 diesel cars sold between 2009 and 2015 model years.

Affected diesel models include:

Jetta (model years 2009 – 2015)
Beetle (model years 2009 – 2015)
Audi A3 (model years 2009 – 2015)
Golf (model years 2009 – 2015)
Passat (model years 2014-2015)

California is separately issuing an In-Use Compliance letter to Volkswagen, and EPA and the California Air Resources Board (CARB) have both initiated investigations based on Volkswagen's alleged actions.

"Working with U.S. EPA we are taking this important step to protect public health thanks to the dogged investigations by our laboratory scientists and staff," said CARB executive officer Richard Corey. "Our goal is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

The federal and California regulators say Volkswagen used a sophisticated software algorithm on certain Volkswagen vehicles that detects when the car is undergoing official emissions testing and turns full emissions controls on only during the test. The effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations.

As a result the cars met emissions standards in the laboratory or testing station, but during

normal operation, emit nitrogen oxides, or NOx, at up to 40 times the permissible standard. The software produced by Volkswagen is a "defeat device," as defined by the Clean Air Act.

Corey said testing groups in Europe found information that indicated Volkswagen may have manipulated its emission tests and told California regulators about their suspicions.

NOx pollution contributes to nitrogen dioxide, ground-level ozone and fine particulate matter. Exposure to these pollutants has been linked with a range of serious health effects, including increased asthma attacks and other respiratory illnesses that can be serious enough to send people to the hospital. Exposure to ozone and particulate matter have also been associated with premature death due to respiratory-related or cardiovascular-related effects. Children, elderly people and those with pre-existing respiratory disease are particularly at risk for health effects of these pollutants.

The Clean Air Act requires vehicle manufacturers to certify to EPA that their products will meet applicable federal emission standards to control air pollution, and every vehicle sold in the U.S. must be covered by an EPA-issued certificate of conformity. Motor vehicles equipped with defeat devices, which reduce the effectiveness of the emission control system during normal driving conditions, cannot be certified. By making and selling vehicles with defeat devices that allowed for higher levels of air emissions than were certified to EPA, Volkswagen violated two important provisions of the Clean Air Act.

EPA and CARB uncovered the defeat device software after independent analysis by researchers at West Virginia University, working with the International Council on Clean Transportation, a non-governmental organization. The researchers raised questions about emissions levels, and the agencies began further investigations into the issue. In September, after EPA and CARB demanded an explanation for the emission problems, Volkswagen admitted that the cars contained defeat devices.

VW may be liable for civil penalties of up to $37,500 per vehicle found to be violating the standard, or potentially more than $18 billion.

It is incumbent upon Volkswagen to initiate the process that will fix the cars' emissions systems. Car owners should know that although these vehicles have emissions exceeding standards, these violations do not present a safety hazard and the cars remain legal to drive and resell. Owners of cars of these models and years do not need to take any action at this time.

Wired:
http://www.wired.com/2015/09/epa-accuses-volkswagen-cheating-emissions-testing-482000-cars/

EPA ACCUSES VOLKSWAGEN OF CHEATING EMISSIONS TESTING ON 482,000 CARS

Alex Davies

THE EPA IS accusing Volkswagen of illegally using software to cheat emissions standards, allowing the German automaker to sell half a million cars that produce smog at 40 times the legal limit.

In a notice of violation of the Clean Air Act sent to Volkswagen AG, Audi AG, and Volkswagen Group of America, Inc today, the EPA said diesel-powered VW cars used a "defeat device," a kind of "a sophisticated software algorithm [that] detects when the car is undergoing official emissions testing, and turns full emissions controls on only during the test. The effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations."

The accusation applies to 482,000 diesel-powered, four-cyclinder Jetta, Beetle, Audi A3, Golf, and Passat cars sold between 2008 and 2015 in the US. The news comes as the Frankfurt motor show, one of the biggest events of the year for the automaker, opens to the press. VW will be required to fix the problem, at no cost to car owners.

The Week:
http://www.theweek.com/speedreads/578080/epa-catches-volkswagen-blatantly-cheating-smog-tests

EPA catches Volkswagen blatantly cheating on smog tests
Jeva Lange

Almost half a million Volkswagen cars, including recent diesel models of Jettas, Beetles, Audi A3s, Golfs, and Passats, may be recalled in an enormous crackdown on the German carmaker's alleged blatant circumvention of smog standards, The New York Times reports.

The Environmental Protection Agency has demanded that the cars be recalled, and specifically accused Volkswagen of installing software, called a "defeat device," in their cars that basically just lies about what a car's emissions are during tests:

The device is programmed to detect when the car is undergoing official emissions testing, and to only turn on full emissions control systems during that testing. Those controls are turned off during normal driving situations, when the vehicles pollute far more heavily than reported by the manufacturer, the E.P.A. said. [The New York Times]

Car emissions contain nitrogen oxide, which creates smog, as well as pollutants that cause asthma.

Volkswagen is accused of sidestepping emissions rules, 'cheating' pollution tests
By JERRY HIRSCH

Federal and California environmental regulators accused Volkswagen of using software that "cheats" pollution testing in nearly 500,000 recent model VWs and Audis by circumventing emission standards in its diesel cars.

The German automaker will eventually have to recall all of the vehicles and change the emissions systems at its own expense, regulators said. Additionally it could face a fine of about $18 billion, or $35,500 per car, federal environmental officials said.

The Environmental Protection Agency on Friday issued the German automaker a "notice of violation" of the Clean Air Act for both VW models and the company's Audi luxury brand. It covers models equipped with four-cylinder diesel engines. The California Air Resources Board issued a similar letter.

Volkswagen and Audi vehicles from model years 2009-2015 have the software, which uses an algorithm that detects when the vehicle is undergoing pollution tests and changes the way it performs from when it is being driven on the open road.

It "is illegal and a threat to public health," said Cynthia Giles, assistant administrator for the Office of Enforcement and Compliance Assurance. "EPA is committed to making sure that all automakers play by the same rules."

"We expected better from VW," Giles said.

Air Resources Board Executive Officer Richard Corey said the California agency wants to bring the cars "into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

Volkswagen said it is cooperating with the investigation.

"We are unable to comment further at this time," the company said in a statement.

The affected diesel models include: Jetta (model years 2009 – 2015,) Beetle (model years 2009 – 2015,) Audi A3 (model years 2009 – 2015,) Golf (model years 2009 – 2015) and Passat (model years 2014-2015.)

Volkswagen And Audi Recall: 500,000 Cars Broke Environmental Rules, White House Says
By Christopher Harress

The Obama administration Friday forced car manufacturer Volkswagen to recall nearly 500,000 cars after it was discovered the German automaker had fitted its vehicles with special technology that can beat environmental tests for reducing smog, according to a new report.

The recall, which was imposed after an investigation by the Environmental Protection Agency, is expected to affect four-cylinder Volkswagen and Audi cars that were manufactured between 2009 and 2015.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," Cynthia Giles, the E.P.A.'s assistant administrator for the Office of Enforcement and Compliance, told the New York Times.

"Working closely with the California Air Resources Board, E.P.A. is committed to making sure that all automakers play by the same rules. E.P.A. will continue to investigate these very serious violations."

EPA: 482K VW diesel vehicles violated emissions rules
David Shepardson

Washington — The Environmental Protection Agency and the state of California said Volkswagen AG violated federal law by allowing 482,000 diesel VW and Audi cars sold since 2009 to evade emissions requirements using sophisticated software.

The announcement is a big setback to the German automaker that has made diesel vehicles a big part of its U.S. strategy. VW could face fines or criminal prosecution and must immediately prevent those vehicles from being able to defeat emissions rules.

VW concealed facts but has now admitted wrongdoing, said Cynthia Giles, assistant administrator for the Office of Enforcement and Compliance Assurance. "We expected better from VW," she said.

The agencies allege that four-cylinder Volkswagen and Audi diesel cars from model years 2009-2015 include software that circumvents EPA emissions standards for certain air pollutants. California is separately issuing an In-Use Compliance letter to Volkswagen, and EPA and the California Air Resources Board have initiated investigations based on Volkswagen's alleged actions.

EPA said the vehicles software "detects when the car is undergoing official emissions testing, and turns full emissions controls on only during the test." The vehicles include diesel Golf, Jetta, Sportwagen, Beetle and Audi A3 vehicles built from 2009-2015.

EPA said "the effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations. This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the standard. The software produced by Volkswagen is a 'defeat device,' as defined by the Clean Air Act."

NOx pollution contributes to nitrogen dioxide, ground-level ozone, and fine particulate matter. EPA said exposure has been linked to serious health issues, including increased asthma attacks and other respiratory illnesses that can be serious enough to send people to the hospital. "Exposure to ozone and particulate matter have also been associated with premature death due to respiratory-related or cardiovascular-related effects. Children, the elderly, and people with pre-existing respiratory disease are particularly at risk for health effects of these pollutants," EPA said.

This is the latest example of automakers not following the miles per gallon and emissions rules.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Giles. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

The Clean Air Act requires vehicle manufacturers to certify to EPA that their products will meet applicable federal emission standards to control air pollution, and every vehicle sold in the U.S. must be covered by an EPA-issued certificate of conformity. Motor vehicles equipped with defeat devices, which reduce the effectiveness of the emission control system during normal driving conditions, cannot be certified.

"Working with U.S. EPA we are taking this important step to protect public health thanks to the dogged investigations by our laboratory scientists and staff," said Air Resources Board Executive Officer Richard Corey. "Our goal now is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of

Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

The issue first came to the attention of the agencies in 2014 after independent analysis by researchers at West Virginia University, working with the International Council on Clean Transportation, a non-governmental organization, raised questions about emissions levels, and the agencies began further investigations into the issue.

In September, after EPA and CARB demanded an explanation for the identified emission problems, Volkswagen admitted that the cars contained defeat devices, the agencies said.

EPA said VW must recall the vehicles. EPA said "owners should know that although these vehicles have emissions exceeding standards, these violations do not present a safety hazard and the cars remain legal to drive and resell. Owners of cars of these models and years do not need to take any action at this time."

EPA Says VW Intentionally Violates Clean Air Standards
By MATTHEW DALY, ASSOCIATED PRESS WASHINGTON — Sep 18, 2015, 12:42 PM ET

The Environmental Protection Agency says nearly 500,000 Volkswagen and Audi diesel cars built in the past seven year are intentionally violating clean air standards by using software that evades EPA emissions standards.

The EPA says the cars include a device programmed to detect when the car is undergoing official emissions testing. The cars only turn on full emissions control systems during that testing. The EPA says the controls are turned off during normal driving situations.

The EPA called the company's use of the device illegal and a threat to public health.

The EPA called on VW to fix the cars' emissions systems, but said car owners do not need to take any immediate action.

VW said in a statement it is cooperating with the investigation.

Bloomberg:
http://www.bloomberg.com/news/articles/2015-09-18/epa-says-volkswagon-software-circumvented-car-emissions-testing

EPA Says Volkswagen Circumvented Car Emissions Tests
Jeff Plungis

Volkswagen AG sold diesel cars with software that circumvented U.S. emissions standards for air pollution, the Environmental Protection Agency said.

The company sold Volkswagen and Audi brand cars from model years 2009-2015 that contained a "sophisticated software algorithm" that detects when the car is undergoing official emissions testing, and turns on full emissions control, the agency said. During normal driving times, the systems don't operate fully, regulators said.

The potential fine is $37,500 per vehicle and 482,000 autos are part of the case, yielding a potential fine of more than $18 billion, Cynthia Giles, EPA assistant administrator for enforcement and compliance, said on a phone call with reporters Friday.

California is also investigating the claims.

Volkswagen said in a statement it is cooperating with the investigation and unable to comment further.

Business Insider:
http://www.businessinsider.com/vw-told-to-recall-500000-cars-after-us-government-accuses-it-of-dodging-clean-air-standards-2015-9

VW told to recall 500,000 cars after US government accuses it of dodging clean air standards
Benjamin Zhang

The Environmental Protection Agency has ordered the recall of 500,000 Volkswagen cars.

According to Coral Davenport of the New York Times, the EPA accused VW of using hidden software — called a "defeat device" — to dodge clean air standard during emissions testing.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," assistant administrator for the Office of Enforcement and Compliance Assurance said Cynthia Giles said in a statement.

"Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

In response to the recall, Volkswagen issued the following statement to Business Insider.

"Volkswagen Group of America, Inc., Volkswagen AG and Audi AG received today notice from the US Environmental Protection Agency, US Department of Justice and the California Air Resources Board of an investigation related to certain emissions compliance

matters. VW is cooperating with the investigation; we are unable to comment further at this time."

The recall affects 482,000 diesel powered cars sold in the US since 2008. They include:

Volkswagen Jetta TDI: 2009-20015
Volkswagen Beetle TDI: 2009-2015
Audi A3 TDI: 2009-2015
Volkswagen Golf TDI: 2009-2015
Volkswagen Passat TDI: 2014-2015

This story is developing. We will update when more information is available.

EPA says Audi, VW cheating on emissions
By JOHN SICILIANO

The Environmental Protection Agency and California regulators charged automakers Volkswagen and Audi on Friday with purposefully violating emission standards in their line of diesel cars.

EPA accused the automakers of using a device in their vehicles to get around the pollution rules. According to EPA, the device regulates emissions, but only turns on and works while emissions are being tested.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, EPA assistant administrator for the agency's enforcement office. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

Giles said VW was "concealing facts" about the devices. The vehicle models involved include the popular Jetta, Audi A-3, Passat and the iconic Beetle, and in model years 2009-2015. The violations cover 482,000 diesel passenger cars.

The EPA's announcement isn't a final decision, but is a clear sign that the EPA believes it

has a case against the automakers, one that could lead to fines as large as $37,000 per vehicle. All together, the combined fines could pile up to $18 billion.

An EPA statement said "California is separately issuing an In-Use Compliance letter to Volkswagen, and EPA and the California Air Resources Board ... have both initiated investigations based on Volkswagen's alleged actions."

"Working with US EPA we are taking this important step to protect public health thanks to the dogged investigations by our laboratory scientists and staff," the California board's CEO Richard Corey said. "Our goal now is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

EPA accuses VW of cheating on emission rules
Published 12:29 PM EDT Sep 18, 2015

NEW YORK (CNNMoney) —Diesel cars from Volkswagen and Audi cheated on clean air rules by including software that made the cars look cleaner than they actually were, according to federal and California regulators.

The regulators say that the software on the cars turned up the emission controls only when it could tell that the car was being tested.

"The effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations," said the Environmental Protection Agency's notice to the company. "This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides at up to 40 times the standard."

There are nearly 500,000 of the diesel cars on U.S. roads. The models include the VW Jetta, the Beetle and the Golf from model years 2009 through 2015, the Passat from 2014-2015 as well as the Audi A3, model years 2009-2015. The luxury brand is owned by Volkswagen.

Owners of the affected cars do not face health risks according to the EPA and can to continue to drive or sell the cars. But the EPA says that VW will be responsible for fixing the problem.

Volkwagen did not immediately respond to a request for comment.

City AM:

Volkswagen told to recall 500,000 vehicles over emissions
by Catherine Neilan

Volkswagen has been ordered to recall nearly half a million cars in the US by the Obama administration, which claims the German car group used software that was purposely designed to dodge environmental standards for reducing smog.

The US government's Environmental Protection Agency issued the company a notice of violation this afternoon, accusing Volkswagen of having installing a "defeat device" into its four-cylinder Volkswagen and Audi vehicles between 2009 and 2015, according to the New York Times.

The device is programmed to detect when the car is undergoing emissions test, during which time it will turn on its full emissions control systems. These controls are reportedly then turned off when the car is driving in "normal" situations, when the cars pollute more heavily than reported by Volkswagen, the EPA claims.

The government agency estimates that 482,000 diesel passenger vehicles are affected.

Volkswagen could not be contacted at the time of publication.

EPA: Volkswagen used 'sophisticated software' to cheat emissions tests
By Ben Wolfgang - The Washington Times - Friday, September 18, 2015

The Obama administration on Friday accused Volkswagen of using a "sophisticated software algorithm" to cheat on emissions testing and mask the fact that some models emit too much harmful pollution.

Some Volkswagen cars from model years 2009 to 2015, the Environmental Protection Agency said, include software that can detect when they're undergoing emissions testing. Full emissions controls were activated only during testing and then automatically shut down during normal operation, the agency charged.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, assistant administrator for the EPA's Office of Enforcement

and Compliance Assurance. “Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters.”

During normal operation, the “defeat device” allowed Volkswagen cars to emit nitrogen oxides at up to 40 times the federal threshold as laid out in the Clean Air Act.

The EPA has issued “a notice of violation” to the automaker, and the state of California has launched its own investigation into the matter. Volkswagen could face civil penalties for the violations, the agency said.

The allegations apply to about 482,000 diesel passenger cars sold since 2008, including Jettas, Beetles, Audi A3s, Golfs and other models.

EPA accuses Volkswagen, Audi of evading emission laws
Nathan Bomey, USA TODAY 12:12 p.m. EDT September 18, 2015

The German automaker adopted a "defeat device" to trick regulators, the EPA said.

The Environmental Protection Agency on Friday accused Volkswagen of installing software on certain cars in the U.S. to evade federal emission regulations, potentially exposing people to harmful pollutants.

The German automaker adopted what the EPA called a "defeat device" to trick U.S. regulators into believing that its cars met Clean Air Act standards, the federal agency said in a statement.

The agency said 482,000 cars violated federal standards, including four-cylinder Volkswagen cars from 2009-15 and Audi diesel cars from the same period. They included the Volkswagen Jetta, Beetle, Golf and Passat, and the Audi A3.

Volkswagen, whose brands include the luxury Audi lineup, may face fines or other penalties, the EPA said.

The cars are still safe to drive, the EPA said, and owners do not need to take immediate

action. But the agency will require Volkswagen to fix the cars for free.

Newsweek:
http://www.newsweek.com/epa-volkswagen-software-cheat-clean-air-rules-373869

EPA: Volkswagen Used Software in Cars to Cheat on Clean Air Rules
BY ZOË SCHLANGER 9/18/15 AT 12:14 PM

A U.S. Environmental Protection Agency investigation has concluded that for years Volkswagen has been installing software in its vehicles that circumvents federal emissions standards for air pollution, the agency announced Friday.

EPA alleges that Volkswagen installed a "sophisticated software algorithm on certain Volkswagen vehicles" that could detect when the car was being tested for emissions. The software would turn full emissions controls on only during the official test. "This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the standard," EPA said in a press release. They called the software a "defeat device," deliberately installed to evade the Clean Air Act standards.

This "defeat device" was found in several car models, from 2009 models up to 2015 models, according to EPA:

Jetta (Model Years 2009 – 2015)
Beetle (Model Years 2009 – 2015)
Audi A3 (Model Years 2009 – 2015)
Golf (Model Years 2009 – 2015)
Passat (Model Years 2014-2015)
In total, this includes about 482,000 passenger cars.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," Cynthia Giles, EPA's Assistant Administrator for the Office of Enforcement and Compliance Assurance, said in a statement emailed Friday. The agency worked with California regulators to investigate the automobile manufacturer and issue a notice of violation.

"Our goal now is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action," California Air Resources Board Executive Officer Richard Corey said in the statement.

Volkswagen has yet to respond publicly to the EPA allegations. Newsweek has reached out to the company for comment, and we will update if they respond.

Volkswagen Is Ordered to Recall Nearly 500,000 Vehicles Over Emissions Software
By CORAL DAVENPORT SEPT. 18, 2015

WASHINGTON — The Obama administration on Friday ordered Volkswagen to recall nearly a half million cars from the road, saying the German automaker used software intentionally designed to circumvent environmental standards for reducing smog.

The Environmental Protection Agency issued the company a notice of violation and accused the company of breaking the law by installing software known as a "defeat device" in 4-cylinder Volkswagen and Audi vehicles from model years 2009-15. The device is programmed to detect when the car is undergoing official emissions testing, and to only turn on full emissions control systems during that testing. Those controls are turned off during normal driving situations, when the vehicles pollute far more heavily than reported by the manufacturer, the E.P.A. said.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, the E.P.A.'s assistant administrator for the Office of Enforcement and Compliance. "Working closely with the California Air Resources Board, E.P.A. is committed to making sure that all automakers play by the same rules. E.P.A. will continue to investigate these very serious violations."

The software was designed to conceal the cars' emissions of the pollutant nitrogen oxide, which contributes to the creation of ozone and smog. The pollutants are linked to a range of health problems, including asthma attacks and other respiratory diseases.

The state of California has issued a separate notice of violation to the company. California, the E.P.A. and the Justice Department are working together on an investigation of the allegations.

The allegations cover roughly 482,000 diesel passenger cars sold in the United States since 2009.

Affected diesel models include the Volkswagen Jetta (model years 2009-15), Volkswagen Beetle (model years 2009–15), Audi A3 (model years 2009–15), Volkswagen Golf (model years 2009–15) and Volkswagen Passat (model years 2014-15).

The notice of violation is part of a broader, more aggressive enforcement effort by federal environmental regulators on the auto industry. Analysts said it was meant to send a clear message to automakers that they will be harshly treated for compromising federal rules.

It follows a November 2014 announcement of the administration's largest-ever penalty for a violation of the Clean Air Act, in which the government fined the Korean automakers Hyundai Motor and Kia Motors a combined $300 million as part of a settlement for overstating vehicle fuel-economy standards on 1.2 million cars.

"They want to make it clear that they're going to crack down on cheaters," said Frank O'Donnell, president of the environmental advocacy group Clean Air Watch. "They're cheating not only car buyers but the breathing public. They want to lay down the law, enforce the law, and show they're not going to tolerate cheaters. The laws and regulation are only as good as the enforcement."

The software was designed to conceal the cars' emissions of the pollutant nitrogen oxide, which contributes to the creation of ozone and smog. The pollutants are linked to a range of health problems, including asthma attacks and other respiratory diseases.

The state of California has issued a separate notice of violation to the company. California, the E.P.A. and the Justice Department are working together on an investigation of the allegations.

VW: 1.8M COMMERCIAL VEHICLES, 700,000 SEAT CARS AFFECTED

BERLIN (AP) -- Volkswagen said Tuesday that 1.8 million commercial vehicles are among those affected by the emissions-rigging scandal, while Spanish unit SEAT said 700,000 of its cars were fitted with the diesel engine in question.

Volkswagen AG has admitted using a piece of engine software to cheat on diesel car emissions tests in the U.S. It said last week the engines concerned are in some 11 million vehicles worldwide, far more than the 482,000 originally identified by U.S. authorities.

Details have emerged gradually of how many were made by which VW division. Guenther Scherelis, a spokesman for the commercial vehicles unit - which makes vans and pickups - on Tuesday confirmed a report in the daily Hannoversche Allgemeine Zeitung that 1.8 million of its vehicles were affected. He didn't give further details.

Spanish subsidiary SEAT said it fitted 700,000 vehicles with the EA 189 diesel engines in which Volkswagen has said there are "discrepancies."
SEAT said the cars were sold worldwide and it was seeking to determine how many were sold in each market.

Also fitted with the suspect software were 5 million VW brand cars, 2.1 million Audis and 1.2 million Skodas.

SEAT and Volkswagen-Audi Spain on Tuesday ordered a suspension of sales of all SEAT, Volkswagen, Audi, Skoda and Volkswagen commercial vehicles with the EA 189 diesel engine. It said this decision would affect 3,320 vehicles currently in stock.

In Brussels, European Union Industry Commissioner Elzbieta Bienkowska was scheduled to meet Tuesday with Volkswagen brand chief Herbert Diess.
"We expect Volkswagen to explain the situation," said EU spokesman Ricardo Cardoso. "The Commission wants facts and wants to get to the bottom of this."

The German government last week set up a commission of inquiry on the scandal. Transport Ministry spokesman Martin Susteck said that the panel is in contact with the U.S. Environmental Protection Agency.

UPDATE 1-Volkswagen to refit cars affected by emissions scandal

BERLIN, Sept 29 (Reuters) - Volkswagen signaled on Tuesday it would recall up to 11 million vehicles as it tries to address the scandal over its admission that it cheated U.S. diesel emissions tests.

New Chief Executive Matthias Mueller said the German carmaker had drawn up a "comprehensive" refit plan to be submitted to regulators aimed at ensuring its diesel models complied with emissions standards.

It will ask customers "in the next few days" to have diesel models equipped with manipulated software refitted and brief authorities on technical fixes in October, Matthias Mueller told a closed-door gathering of about 1,000 top managers at Volkswagen's Wolfsburg headquarters late on Monday.

The company is under huge pressure to tackle the biggest business-related crisis in its 78-year history. Germany's KBA regulator had set an Oct. 7 deadline for it to present a plan to bring diesel emissions into line with the law.

Volkswagen has said previously about 11 million vehicles were fitted with software capable of cheating emissions tests, including 5 million at its namesake brand, 2.1 million at luxury brand Audi, 1.2 million at Czech division Skoda and 1.8 million light commercial vehicles.

"We are facing a long trudge and a lot of hard work," Mueller, appointed CEO of Europe's biggest automaker last Friday, said in the speech text seen by Reuters. "We will only be able to make progress in steps and there will be setbacks."

Separately, Mueller said Volkswagen's troubled core VW division, struggling with high fixed costs and low profit margins, would in future be able to act as independently as premium flagship brands Audi and Porsche.

"The new company structure is a first step and the basis for a modernization of VW, for a new and better company," he said. (Reporting by Andreas Cremer; Editing by Ludwig Burger<http://blogs.reuters.com/search/journalist.php?edition=us&n=ludwig.burger&> and Mark Potter)

BBC News:

Seat says 700,000 cars have 'cheat' emissions software VW crisis
Seat has said about 700,000 of its cars are fitted with the software that allowed parent company Volkswagen to cheat US emissions tests.

A spokesman said they are currently trying to work out how many were sold in each national market.
In Spain slightly over 3,000 new cars are affected but showrooms have been told to put them aside.
VW has said a total of 11m diesel engines are involved in the emission's scandal.
Broken down brand-by-brand they are:

* VW - 5m
* Audi - 2.1m
* Skoda - 1.2m
* Seat - 700,000
* Vans - 1.8m

Seat said it planned to contact owners so their cars can undergo tests.
It will also set up a search engine on its website to allow customers to find out if their vehicles are affected.
The Spanish carmaker said it had temporarily suspended the sale and delivery of all new

vehicles with the EA 189 engines which contain the software.

Volkswagen scandal
11 million
Vehicles affected worldwide

* €6.5bn Set aside by VW
* $18bn Potential fines
* No. 1 Global carmaker in sales

Scandal spilling over
The scandal is continuing to hit VW's share price. On Tuesday it fell another 1.5%<http://www.bbc.co.uk/news/business/market_data/shares/5/113230/one_month.stm> during morning trade in Frankfurt. The company has lost 35% of its market value since last Monday.

A survey of 62 institutional investors by the investment banking advisory firm Evercore, showed 66% of them would not invest in VW for 6 months or until it clarified what costs, fines, and legal proceedings it faced.

The effects are also spilling over into the local economy around VW's headquarters in Wolfsburg. The city is expecting a fall in business tax revenue from VW and the mayor has announced a budget freeze and hiring ban on public sector workers.

The scandal was revealed after the US Environmental Protection Agency found that some VW diesel cars were fitted with devices that could detect when the engine was being tested, and could change the car's performance to improve results.

The German company has apologised for breaching consumers' trust, and on Friday announced that Matthias Mueller was replacing Martin Winterkorn as chief executive. Mr Mueller promised a "relentless" investigation to uncover what went wrong.

He said the group was "facing the severest test in its history."

German prosecutors announced on Monday that it was conducting a criminal investigation of Volkswagen's former chief executive.

Volkswagen Close to Diesel Fix as Sales of Rigged Cars Halted
Elisabeth Behrmann<http://www.bloomberg.com/authors/AP6ltgka_yg/elisabeth-behrmann>
September 29, 2015 — 8:06 AM EDT

A brand new Volkswagen Passat and a Golf 7 car are stored in a tower at the Volkswagen Autostadt complex near the Volkswagen factory in Wolfsburg, Germany.
Sales halted in Spain, Switzerland, Italy and the Netherlands

* Volkswagen to inform customers soon of plans for repairs

Volkswagen AG is close to announcing a fix to emissions systems that cheated on pollution tests, as sales of vehicles with the rigged diesel engines get halted in a growing number of European countries.

Cars with the affected diesel engines are being pulled from markets including Spain, Switzerland, Italy, the Netherlands and Belgium, while prosecutors in Sweden consider opening an investigation on potential corruption. For vehicles already sold, Volkswagen is looking to inform customers soon about the steps it will take to repair the vehicles.
"It's going to depress their market share for a while, maybe even up to one to two years," said Richard Gane, an automotive specialist at supply-chain consultancy Vendigital Ltd. "This is going to run and run."

Almost two weeks after it publicly admitted to cheating on diesel emissions tests in the U.S., Volkswagen has yet to provide a comprehensive breakdown of the car models and markets affected. Information has emerged piecemeal in the scandal over a type of diesel engine installed in as many as 11 million vehicles worldwide. The number includes about 5 million VW brand cars, 2.1 million Audi models, 1.2 million from the Skoda unit and 700,000 from the Spanish Seat nameplate.

German Deadline

To reach out to customers, Volkswagen is looking into setting up websites in various countries so drivers can check on actions locally. The company has already set up a site<http://www.vwdieselinfo.com/> in the U.S., where the scandal started.
The German government has set an Oct. 7 deadline for Volkswagen to say how it'll bring some 2.8 million diesels in its home market up to standard, threatening to pull the cars off the road if the carmaker fails to do so.

As Volkswagen seeks to recover, the executive committee of its supervisory board, made up of union officials as well as shareholder representatives from the Porsche family and Lower Saxony, is meeting Wednesday to discuss the latest results from the investigation, a person familiar with the situation said.

Volkswagen Chief Executive Officer Matthias Mueller, who was appointed on Friday, said a project team devised a plan over the weekend and the company will start informing customers in the coming days that the emissions of their vehicles will need to be improved. The fix will be presented to regulators for approval in October.

'Long Road'

"We have a long road and a lot of work ahead of us," Mueller said in a speech to Volkswagen's management late Monday, confirming that the company hired law firmJones

Day to assist with its internal investigation. “To this end, thoroughness is more important than speed.”
Still, pressure is building on the company to come up with a solution. Swedish prosecutors at the National Anti-Corruption Unit are evaluating whether they have jurisdiction to start their own probe, said Alf Johansson, a chief prosecutor at the unit. In the Netherlands, the government is exploring regionwide recall of the vehicles.

“We would like you to consider the possibilities of a European recall,” Dutch State Secretary Wilma Mansveld said in a Sept. 25 letter to the European Commission. “This has to ensure that all faulty software is removed from the market and replaced by proper software that allows proper emission reduction.”

California Teachers' Pension Scolds Volkswagen on Emissions Dupe
Alison Vekshin<http://www.bloomberg.com/politics/authors/AOWq1oX1-C4/alison-vekshin> <http://twitter.com/alisonvekshin> Margaret Collins<http://www.bloomberg.com/politics/authors/APs6rgY-8H4/margaret-collins>Tim Jones<http://www.bloomberg.com/politics/authors/AQIjj4Bpzcg/tim-jones>
September 29, 2015 — 5:00 AM EDT

California’s $184 billion pension fund for school teachers chided Volkswagen AG for rigging some diesel engines to cheat on U.S. emission tests and said it is evaluating its exposure to losses from the scandal.

The California State Teachers’ Retirement System, the second biggest U.S public pension, held 37,580 Volkswagen shares valued at $4.85 million as of Sept. 25 and 284,856 of the company’s preferred shares worth $34.2 million.

The Wolfsburg, Germany-based company admitted Sept. 18 that it programmed some of its cars’ diesel engines to meet emissions standards only when undergoing official tests while letting them exceed legal pollutant limits on the road. Volkswagen’s market value has plunged 27 billion euros ($30.3 billion) since the announcement.

“As owners we actively monitor our holdings and expect our portfolio companies to govern themselves responsibly.”

- Michael Sicilia, Calstrs spokesman

“Calstrs is clearly disappointed that a company in our portfolio has managed to simultaneously damage both its shareholder value and the environment that we’re pledging to protect,” said Michael Sicilia, a Calstrs spokesman. “As owners we actively monitor our holdings and expect our portfolio companies to govern themselves responsibly.”

About 11 million vehicles around the world were fitted with the defeat devices. The company has set aside 6.5 billion euros to cover damages including fixes, potential regulatory fines and lawsuits.

Not only is California home to the two biggest public pension funds, it has more of the cars on its roads than any other state and has the toughest carbon emission standards in the U.S.

Following the admission that the company cheated in order to try and gain U.S. market share, Chief Executive Officer Martin Winterkorn stepped down and the U.S. Federal Bureau of Investigation has opened a criminal probe. U.S. states also are looking into the company's actions.

Volkswagen is facing more than 80 federal court lawsuits by consumers alleging the company committed fraud by cheating on emissions tests, inducing them to pay more for their vehicles. Those lawsuits were filed as class actions representing all consumers in the U.S. or in individual states who leased or bought the vehicles.

A Michigan pension fund for police and firefighters alleges in a lawsuit that holders of VW's American depositary receipts lost hundreds of millions of dollars.

The $286 billion California Public Employees' Retirement System said it has about $165 million invested in Volkswagen. The fund, the biggest in the U.S., is "examining the situation and continue to monitor," said spokesman Joe DeAnda.

New York state's pension fund -- which was worth $184.5 billion as of March 31 -- has 22,927 ordinary shares of Volkswagen valued at about $5 million, according to Matt Sweeney, a spokesman for state Comptroller Thomas DiNapoli, the fund's sole trustee. It has another 159,979 shares of Volkswagen's non-voting preferred shares worth $33.3 million, Sweeney said by e-mail.

The $50 billion Alaska Permanent Fund Corporation held 15,009 shares of Volkswagen stock as of June 30, valued at $3.47 million. "It doesn't exactly move the needle, does it?" said Laura Achee, the fund's director of communications.

The Teacher Retirement System of Texas declined to comment on its holdings but said that any investment in Volkswagen would be a drop in the bucket of its $132 billion assets, according to communications director Howard Goldman. At the $26 billion Employees Retirement System of Texas, which provides retirement benefits for state employees, retirees and their dependents, VW holdings are similarly negligible.

"We have some in equities and in fixed income, but very small," said spokeswoman Mary Jane Wardlow in an e-mail.

Volkswagen shares are also held in the pension plans of private companies including General Motors Co. and International Business Machines Corp., according to their latest

filings with the Labor Department.

GM doesn't comment on individual holdings in its pension plans, spokesman Pat Morrissey said in an e-mail. The company reported shares in Volkswagen valued at about $1 million in its latest filing with the Labor Department as of Sept. 30, 2014. That's a small portion of the plan's about $80 billion.

CBS News:
http://www.cbsnews.com/news/volkswagen-faces-daunting-challenges-in-fixing-emissions-cheating/

VW faces daunting challenges in fixing emissions cheating

DETROIT - Volkswagen faces daunting challenges in fixing software that enables cheating on diesel engine emissions tests, a task that's becoming more urgent because of growing anger from customers.

The company has set aside $7.3 billion to pay for the scandal. But experts say it's likely to cost much more as VW tries to comply with U.S. clean air regulations while appeasing diesel owners who paid extra for the cars, thinking they could help the environment without sacrificing performance.

"We understand that owners of the cars affected by the emissions compliance issues are upset," VW said on a consumer website launched Sunday. The company asked for patience and said it would address the issue as fast as it can. A spokeswoman wouldn't comment further.

But experts said VW will have to strike a careful balance to appease government regulators, make customers happy and avoid emptying the company cash box. A cheap remedy of software fixes likely would hurt performance and gas mileage, further antagonizing customers. A more expensive fix that adds a treatment system wouldn't hurt performance, but it would cost thousands per car and by one analyst's estimate, could total more than $20 billion including vehicles in the U.S. and Europe.

That's in addition to a potential $18 billion fine in the U.S. and the cost of numerous class-action lawsuits alleging that VW's cheating reduced the value of its customers' cars.

The scandal broke on Sept. 18, when the U.S. Environmental Protection Agency and the

California Air Resources Board accused VW of installing secret software on 2-liter four-cylinder diesel engines that turned on pollution controls for lab tests and shut them off during real-world driving. As a result, 482,000 Jettas, Beetles, Golfs and Passats from the 2009 to 2015 model years belched out 10 to 40 times as much ozone-causing nitrogen oxide as U.S. law allows.

A few days later, VW admitted the same "defeat device" that switched the pollution controls on and off was on 11 million cars worldwide. Germany says 2.8 million cars there are affected.

Software in the main engine control computer figured out when the cars were being tested on a treadmill-like device called a dynamometer that the EPA used for verification and turned the controls on.

With the pollution controls on, the cars are less efficient and won't accelerate as fast, the two main reasons why people bought the VW diesels, said Matt DeLorenzo, managing editor and a diesel expert for Kelley Blue Book. VW could change the software and leave the controls on to satisfy the EPA and California regulators. But that would anger customers and likely would force VW to compensate them for the reduced mileage, just as Hyundai did when it got caught with inflated fuel economy estimates, DeLorenzo said.

"If it's really sluggish and doesn't get out of its own way, that's a bigger issue (to customers) than fuel economy," DeLorenzo said. "People notice that big of a change in performance."

The other option is to add a diesel exhaust treatment system that's used by other manufacturers and even by VW on larger diesel engines. The treatment involves adding a tank of a chemical called urea, which enables the cars to separate nitrogen oxide into harmless nitrogen and oxygen. That would cost $2,000 or more per car, DeLorenzo said.

Engineers would have to find room for a tank to store the blue urea fluid, which has to be refilled about every 7,500 miles, DeLorenzo said. And VW probably would have to compensate customers for years of urea cost, which is about $13 for 2.5 gallons.

VW probably tried to avoid urea systems in the beginning because their cost would have driven Jetta and Golf prices above competitors, especially gas-electric hybrids, DeLorenzo said. Now, adding it after the fact will cost even more, he said.

The scandal has forced Volkswagen to tell U.S. dealers not to sell cars with the suspect diesel engines. VW said on Sunday that it's working to get government approval to sell 2016 models with updated engines "which we believe do not have any of the issues the government has identified in other vehicles."

The 2015 and 2016 models have a new version of the 2-liter diesel engine that probably runs cleaner and could need just a software change to comply, DeLorenzo said.

But on older models from 2009 to 2014, the fix may be more difficult. Mike Jackson, CEO

of AutoNation, the largest dealership chain in the U.S., said he was told by VW that it will take hardware and software changes to fix the older models. The EPA says it may take VW a year to develop a fix.

Before the 2009 model year, U.S. diesel emissions standards weren't as strict, so those cars likely passed the tests without a defeat device, DeLorenzo said.

Whenever the fix comes, it's possible that owners might not get it done if it hurts their cars' mileage and performance, and the EPA can't force people to take their cars in for repairs. The agency only has authority over automakers, not car owners.

The EPA says some states require proof that emissions recalls have been fixed before license plates are renewed. And the possibility of failing emissions inspections in states that require them apparently won't be an issue because of the cheating software. "The defeat device was specifically designed to ensure that vehicles would pass inspection," the agency says on its website.

In wake of the scandal, the automaker's stock dropped about 30 percent this past week alone, CBS News correspondent Kris Van Cleave reported.

Volkswagen introduced is new CEO on Friday. Matthias Mueller, the former head of Porsche, will try to restore VW's reputation.

The Guardian:
http://www.theguardian.com/business/2015/sep/26/volkswagen-scandal-emissions-tests-john-german-research

Meet John German: the man who helped expose Volkswagen's emissions scandal
Automative engineer's research connected the dots to how the automaker manipulated diesel emissions tests – but that was never the intention
Rupert Neate in New York

John German has barely had time to catch his breath all week between appearances on TV news channel and radio phone-in shows. He's an unlikely media star, not a pop singer or reality TV contestant, but a grey-haired automotive engineer thrust into the global spotlight after he and his colleagues were credited with helping uncover one of the biggest ever corporate scandals.

"We really didn't expect to find anything," German said of his research that found Volkswagen had installed sophisticated software designed to cheat strict emission tests across the world. His simple test – checking the car's emissions on real roads rather than in lab test conditions – led to the resignation of VW's chief executive after the German company was forced to admit it installed "defeat devices" in 11m cars. The scandal has wiped more than €24bn ($26.8bn) off VW's market value.

Many questions remain but one thing is clear to German: "It was not an accident," he said. "A lot of work has gone into this."

When German finally found a moment of peace this week he called his wife in Ann Arbor, Michigan. "She said: 'You know you've made it now, you can retire and be very happy'," German told the Guardian as he prepared to board a plane back to Michigan after a week in the spotlight in Washington DC. "No, no, no, I can't afford to yet," German told his disappointed wife.

He may have helped uncover one of the world's biggest corporate scandals, but German earns a modest salary as US co-lead of the International Council on Clean Transportation (ICCT) a small nonprofit organisation dedicated to helping to reduce vehicle emissions and has an annual budget of just $12m.

"It has been totally overwhelming," German said of the global interest in his research this week. "I've been doing nothing else [but responding to the media and politicians] for 12 hours a day since Friday," when US regulators announced their findings against VW based on German's research] "We're a small organisation that primarily deals with information on diesel filters, so this is unprecedented and overwhelming.

"As an organisation that is trying to reduce emissions and improve efficiency it is always gratifying to see results from our work, but we never dreamed we would have this kind of impact."

German explained that the idea to carry out the test, which he described as "very ordinary", came from Peter Mock, a colleague in Europe, who noticed discrepancies in the emissions of the diesel VW Passat and VW Jetta. He said they decided to carry out on-the-road tests in the US as the emissions regulations are much stricter than in the EU. They expected the cars to pass and they could use this as proof to show Europeans that it was possible to run diesels with cleaner emissions.

German, who has a degree in physics from the University of Michigan and said he "got over halfway through an MBA before he came to his senses", sought out the assistance of the West Virginia University's Center for Alternative Fuels, Engines and Emissions. The WVU provided a portable emission measurement system that could be put in the car's boot (trunk) with an attached probe placed in the exhaust pipe.

Then German sourced a Passat, Jetta and a BMW X5 (which also showed emissions discrepancies in Europe) and "had a drive around". "The VWs were massively exceeding their official emissions readings in normal driving conditions, which was completely inexplicable and totally surprised us," German said.

Thinking it must be a technical error, the tests were expanded and the cars were driven more than 1,200 miles from San Diego to Seattle – almost the entire length of the west coast of the US.

The VWs nitrogen oxide emissions – which creates smog and has been linked to increased asthma attacks and other respiratory illnesses – still exceeded the US standards by up to 35 times. The BMW X5 was within the regulated range.

Arvind Thiruvengadam, a research assistant professor at WVU, who conducted the tests said: "We were doubting ourselves and our procedures and making sure to double check that we were not doing anything wrong. We did so much testing we couldn't possibly doing the same mistake again and again.

"We were like 'OK, we're going to write a lot of journal papers, and we'll be happy if three people read these journal papers,'" he told National Public Radio last week. "That's our happiness at that point."

German published the research in May 2014 and handed it over to the Environment Protection Agency (EPA). "There was an expectation that they would find out what was causing the higher-than-expected emissions," he said. "We did send a courtesy copy to VW to say 'vehicles B and C are your vehicles and you might like to know', we had no response."

There was no response from the EPA either, but keen-eyed German noticed an EPA press release in which VW agreed to recall almost 500,000 vehicles in December 2014 to reinstall software, which it said would solve the higher-than-expected emissions.

However, a couple of months later the California Air Resources Board (Carb) carried out spot checks and discovered that the "defeat device" software – used to dramatically reduces nitrogen oxide (NOx) emissions only when the cars are undergoing strict emission tests – was still present.

"That is actually the single most inexplicable thing about this whole business," German said. "VW had a chance to fix the problem, and they continued to try and cheat and do what they had done. That's just amazing."

"Only then did VW admit it had designed and installed a defeat device in these vehicles in the form of a sophisticated software algorithm that detected when a vehicle was undergoing emissions testing," the EPA said in a statement last week.

German said it was unclear how the defeat device software worked, but the software could work by detecting periods when the steering column wasn't turning but the wheels were which would indicate the car was on dynamo-meters for testing, or could also test for the precise uniform temperature that the tests are carried out at.

"The kind of software it takes to first detect when you're driving on the official test would be very hard to develop. And then you would need duplicate software to tell the car to have two different emission controls."

UK, France and Germany lobbied for flawed car emissions tests, documents reveal

He said it was impossible to know how far up the food chain at VW the fraudulent activity went, but said: "It would have had to be quite a few people involved. It certainly won't have just been one individual."

German said VW could have continued in the deceit for the foreseeable future if no one had thought to test the cars emissions on real roads. He said there is no way to know if other car companies may also have been using similar methods to trick official emission tests, but welcomed UK, German and US regulators moves to retest cars emissions on real roads.

German, who drives a 1997 Honda Accord station wagon that he says has pretty good emissions for a manual transmission, said he hopes his work will act as a wake-up call and scare the whole industry into making certain that their vehicles comply with all emissions regulations. "Companies should realise they might get away with stuff for a little while, but it will catch up with them."

He refused to enter into discussion about what sort of action should be taken against VW, which is facing a fine of up to $16bn in the US alone and a possible criminal investigation. "That's really up to others, I'm just an engineer from Michigan it's really beyond my field of reach."

Consumerist:
http://consumerist.com/2015/09/28/report-volkswagen-knew-of-defeat-devices-eight-years-before-epa-action/

Report: Volkswagen Knew Of "Defeat Devices" Eight Years Before EPA Action
By Ashlee Kieler September 28, 2015

An internal review spurred by the emissions scandal that has engulfed Volkswagen over the past week found that the carmaker knew that so-called "defeat devices," used to trick emissions tests, were used in more than 11 million VW and 2.1 million Audi diesel vehicles for several years before the Environmental Protection Agency issued a violation notice to the manufacturer ordering it to recall some 500,000 million sedans.

The Associated Press, citing two German publications, reported Monday that VW's internal investigation has so far found at least two incidents in which VW was made aware that the use of defeat devices were against the law.

The Frankfurter Allgemeine Sonntagszeitung, a German publication, reported on Sunday that VW's internal investigation shows one of the company's own technicians was aware of the software.

Back in 2011, an engineer reportedly expressed concern that using the device was illegal, but was ignored.

The same investigation turned up a letter, dated 2007, from parts supplier Bosch that

warned the car company not to use the software during regular operations of vehicles.

According to Bild am Sonntag, sources uncovered the internal communications between Bosch and VW, with the parts supplier insisting that the software was for test purposes and that using it in regular operation would be against the law.

Bosch, one of the largest car parts suppliers in the world, admitted last week that it supplied many of the key components for the defeat devices as a way to evade emissions standards for certain pollutants with a range of serious health effects.

According to the EPA's order [PDF], the "sophisticated software algorithm" in the vehicles is programmed to detect when the car is undergoing official emissions testing, and to only turn on full emissions control systems during that testing.

However, the effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations.

Volkswagen declined to address the new reports, saying it doesn't comment on "rumors and speculation."

"Volkswagen is working with all its strength to conduct a thorough and merciless investigation of this matter," a spokesperson tells the AP.

In addition to new revelations that VW was aware that the defeat devices were illegal, CNBC reports that the company's now former CEO Martin Winterkorn is under criminal investigation by German prosecutors related to fraud.

Winterkorn stepped down last week, noting that he took full responsibility for irregularities in nearly 11 million diesel vehicles found to contain "defeat devices," the former CEO is at the center of the latest investigation into the manufacturer.

Mothers Jones:
http://www.motherjones.com/kevin-drum/2015/09/vw-tries-blame-engine-emissions-fraud-low-level-engineers-and-technicians

VW Tries to Blame Engine Emissions Fraud on Low-Level "Engineers and Technicians"
—By Kevin Drum

I guess it was just a few bad apples. That's a relief:

Volkswagen has blamed its emissions scandal on a "small group" of people and has suspended a number of staff as Matthias Müller was unveiled as its new chief executive.

....Berthold Huber, the acting head of VW's supervisory board, called the crisis a "moral and policy disaster"...."The test manipulations are a moral and political disaster for

Volkswagen. The unlawful behaviour of engineers and technicians involved in engine development shocked Volkswagen just as much as it shocked the public."

This is ridiculous. What incentive do low-level engineers and technicians have to do this on their own? Hell, they couldn't even take on a project like this unless their managers OKed the time to do it, and their managers wouldn't do it unless they were being pressed by higher-ups. Anybody who's ever worked at a big corporation knows this perfectly well. And according to Bloomberg, that's exactly what happened:

Volkswagen AG executives in Germany controlled the key aspects of emissions tests whose results the carmaker now admits were faked, according to three people familiar with the company's U.S. operations.

....Their accounts show the chain of command and those involved in the deception stretched to Volkswagen headquarters.... Ulrich Hackenberg.... Wolfgang Hatz are among those who will leave the company in the wake of Winterkorn's resignation two days ago, two people familiar with the matter said. The two previously ran units at the heart of the affair — Hackenberg, a Winterkorn confidant, was responsible for VW brand development from 2007 to 2013, while Hatz ran the group's motor development from 2007 to 2011.

Will it go even higher? Stay tuned. However, I'll call BS on UBS, which apparently thinks this scandal "could signal the eventual end of the combustion engine." Please. There's no difficulty "amassing accurate data" on engine emissions, as one of their analysts suggests. VW amassed very precise data. They just chose to hide it by means of a calculated, premeditated, multi-year fraud. Anyone who hasn't done the same should be in fine shape.

Legal woes mounting for Volkswagen as criminal cases loom
Volkswagen admitted that 11 million of its diesel vehicles sold worldwide contained software specifically designed to help cheat emissions tests.
By Michael Biesecker and Eric Tucker ASSOCIATED PRESS SEPTEMBER 28, 2015

WASHINGTON — Who knew about the deception, when did they know it, and who directed it?

Those are among the questions that state and federal investigators want answered as they

plunge into the emissions scandal at Volkswagen, which has cost the chief executive his job, caused stock prices to plummet, and could result in billions of dollars in fines.

Legal experts say the German automaker is likely to face significant legal problems, including potential criminal charges, arising from its admission that 11 million of its diesel vehicles sold worldwide contained software specifically designed to help cheat emissions tests.

The Environmental Protection Agency has accused VW of installing sophisticated stealth software that enabled ''clean diesel'' versions of its Passat, Jetta, Golf, and Beetle models to detect when they were being tested and emit less-polluting exhaust than in real-world driving conditions. The agency says the ''defeat devices'' allowed those models to belch up to 40 times the allowed amounts of harmful fumes in order to improve driving performance.

The Justice Department says it's ''working closely'' with EPA investigators.

''If there is sufficient evidence to show that Volkswagen intentionally programmed its vehicles to override the emission control devices, the company and any individuals involved could face criminal charges under the Clean Air Act, and for conspiracy, fraud, and false statements,'' said David M. Uhlmann, a former chief of the Justice Department's Environmental Crimes Section who is now a law professor at the University of Michigan. He called criminal charges ''almost certain.''

But Uhlmann cautioned that hauling the executives involved into a US courtroom could be challenging, because much of the conduct at issue probably occurred overseas. While the United States has an extradition treaty with Germany, European regulators also are investigating and could claim first dibs on prosecuting company officials.

'[Volkswagen is] facing a tsunami of possible state and federal enforce-ment actions.' William Carter, former federal prosecutor who specialized in environmental crimes

It's not the first time that Volkswagen has been accused of cheating on emissions testing by the EPA. In July 1973, the agency found that VW had installed temperature-sensitive devices that turned off emissions controls on about 25,000 Fastback, Squareback, and bus models. The company agreed to remove the devices and eventually settled with the Justice Department, paying a $120,000 penalty.

Chief executive Martin Winterkorn resigned on Wednesday, and Volkswagen announced it would set aside $7.3 billion to cover the cost of the scandal, but even that may not be enough.

The company has apologized, but has not yet detailed who was responsible for the defeat devices.

German media reported Sunday that Volkswagen had received warnings years ago about the use of illegal tricks to defeat emissions tests. Bild am Sonntag said VW's internal

investigation has found a 2007 letter from parts supplier Bosch warning Volkswagen not to use the software during regular operation. Frankfurter Allgemeine Sonntagszeitung said a Volkswagen technician raised concerns about illegal practices in connection with emissions levels in 2011.

A Volkswagen spokesman declined to comment on the reports.

The Clean Air Act allows for fines of up to $37,500 for each of the 482,000 suspect VWs sold in the United States, potentially totaling more than $18 billion. Attorneys general for nearly 30 states and the District of Columbia have announced a coordinated investigation and said they are issuing subpoenas for company records.

There's also a high likelihood of class-action lawsuits by angry VW owners.

''They're facing a tsunami of possible state and federal enforcement actions, and a potential large number of violations — including administrative, civil, and criminal,'' said William Carter, a former federal prosecutor in Los Angeles who specialized in environmental crimes and served as general counsel of the California Environmental Protection Agency.

Investigators will almost certainly look for any false statements made to the EPA and for signs that VW has tried to conceal wrongdoing or obstruct regulators. Fraud charges could be considered if evidence emerges that company executives used the Internet or the mail system to carry out the deception. And money laundering allegations will be explored if investigators suspect that VW sent illicit proceeds overseas.

''If a software package such as this were intentionally designed to defeat the emissions testing, there may well be e-mail traffic, meetings, records that would establish that intent,'' said Gregory Linsin, a former environmental crimes prosecutor at the Justice Department.

But Linsin said he expected the Justice Department also to take into account the multiple investigations likely to take place worldwide, and to not punish the automaker in a way that jeopardizes its ability to stay in business.

The problems at VW come as the Justice Department faces growing pressure to prosecute individual executives and employees for corporate misdeeds. The last two major criminal investigations against auto companies — Toyota and General Motors — yielded massive fines over car safety problems but have resulted in no prosecutions of executives. Those outcomes dismayed consumer watchdog groups and grieving victims' relatives, who demanded better accountability for failure to disclose vehicle defects.

A memo this month by Deputy Attorney General Sally Yates sought to reaffirm the Justice Department's commitment to prosecuting employees and executives, directing among other policy mandates that corporations pushing for credit for cooperating with the government must first turn over evidence against individuals.

''Volkswagen has a fundamental choice to make,'' said Uhlmann, the former prosecutor.

''That is whether it intends to cooperate and seek leniency, or whether it wants to fight the charges. Every indication over the last several days from Volkswagen is that it intends to cooperate.''

Asked whether that meant he expected company executives to voluntarily come to the United States to stand trial, he laughed.

''Absolutely not,'' he said.

Sell, sue or stay put: considerations for Volkswagen owners
Tom Krisher and Dee-Ann Durbin
Updated: 27 September 2015 11:10 PM

DETROIT — If you're driving a diesel-powered four-cylinder Volkswagen, you're stuck with a fun-to-drive machine that's belching unhealthy pollutants from its tailpipe.

Until the company figures out how to fix its bogus emissions controls, there isn't much you can do about your dirty diesel.

Following disclosures that Volkswagen developed software for its 2-liter diesel engine that could better control pollutants during testing than in real-world driving, there's a lot up in the air for owners of Jettas, Golfs, Passats and Beetles and Audi's A3.

Here are some things to consider if you're thinking of suing, selling or are unsure of what to do next.

The problem

VW's software turned on pollution controls for government tests, which are done on a treadmill device called a dynamometer. When the software deduced that the cars were back on the street, the controls went off and the cars polluted too much. About 500,000 of the cars were sold in the U.S.

VW hasn't said how it will fix the problem.

Owners worry the repairs will cut fuel economy and performance — the reasons they bought the "clean" diesels in the first place.

"I really hope they fix this thing," said Zandy Hartig, an actress in Los Angeles who owns a diesel 2013 Jetta SportWagen. "I assume since they did it on purpose they can undo it."

The EPA has told VW to fix the cars so they comply with pollution regulations, but there's no word from the company on how or when that will be done. The EPA said it could take a year.

"We understand that owners of the cars affected by the emissions compliance issues are upset," VW said on a consumer website launched Sunday. The company asked for patience and said it would address the issue as fast as it can. A spokeswoman wouldn't comment further.

A recall fix may be coming soon for 2015 and 2016 models, neither of which can be sold until repairs are made. Mike Jackson, CEO of AutoNation, the country's largest auto dealership chain, said that he was told by VW officials that a software change will bring the last two model years into compliance.

But it's a mystery how the company will fix models from 2009 through 2014, including whether software and equipment changes will be needed, he said.

Did my car lose value?

Worried about their cars losing value, some owners might rush to put the car up for sale.

Eric Ibara, senior analyst for Kelley Blue Book, is encouraging owners to hang on to their VWs, at least until the company comes up with a fix.

Ibara said the impact on VW's resale values may not be known for two or three weeks. The price that dealers agree to pay for vehicles being auctioned this week will be the first indication.

VW diesels traditionally have higher resale values than gasoline counterparts, but the scandal might erode that premium, Ibara said, especially if the fix cuts mileage or impacts their sporty performance.

If repairs are made, history shows there might not be a lasting impact. General Motors' residual values weren't affected by ignition switch recalls, and Toyota's car values returned to normal within a year of an unintended acceleration crisis.

Some owners are hoping for rebates, while a consumer group called on VW to buy back the diesels.

Legal action?

Joining a lawsuit against VW is one option for owners, although it is likely to take years to get any relief.

Several U.S. lawsuits have been filed, some alleging the cars' values will fall because of the scheme.

Consumers could have some success in the courtroom. In 2012, for example, Toyota agreed to pay more than $1 billion to resolve hundreds of lawsuits filed by owners who said their vehicles lost value after the company's unintended acceleration problems.

Also, politicians are calling on the Federal Trade Commission to investigate, because VW often advertised the cleanliness of the vehicles. The FTC, which monitors advertising claims, can seek remedies for all of the car owners.

Don Marron, 58, a banker from Allentown, Pa., wants Volkswagen to take back his 2012 SportWagen and apply the credit toward a new car. He'd also consider a repair that didn't compromise performance or fuel economy.

"I'm going to wait and see what they do, but I'm not going to do nothing," he said. "It's just dumb that they did this. How could they think that it wasn't going to be discovered? What arrogance, what bad judgment."

WSJ:
http://www.wsj.com/articles/auto-parts-makers-hit-by-vw-scandal-1443395198

Auto-Parts Makers Hit by VW Scandal
Suppliers move to defend diesel technology, fearing shift toward alternatives
By JEFF BENNETT
Updated Sept. 27, 2015 7:50 p.m. ET

Auto-parts makers with big exposure to the diesel-car market are racing to salvage the technology's reputation in the wake of the Volkswagen AG emissions-cheating scandal.

Shares of the parts makers, which include Tenneco Inc., BorgWarner Inc., Delphi Automotive PLC and Continental AG, were pummeled last week following the Environmental Protection Agency's disclosure that VW cheated for years on emissions tests of its diesel-powered cars.

The parts industry's focus has shifted to defending the viability of diesel technology amid concerns that betrayed consumers or auto makers, which face tighter government scrutiny of diesel, will turn their attention to hybrids and electric-powered vehicles.

"You can't have an event like this without questions being raised, but that doesn't mean the technology doesn't work," said Terrence Hahn, chief executive of Honeywell International Inc.'s $3.8 billion Transportation Systems unit.

"We have seen proven results around clean-diesel technology, and we don't want what one auto maker has done to tarnish the industry or the technology," Mr. Hahn said.

Wall Street wasn't convinced, however. Shares of Honeywell, a major supplier of the

turbochargers often used to make diesel-powered cars peppier, fell 10 cents Friday to $93.52, down about 5% from their close on Sept. 18. That was the day the EPA accused VW of installing illegal software that sharply reduces nitrogen-oxide emissions, but only when the cars are undergoing strict emission tests.

VW later acknowledged its use of the software and issued an apology.

The company promised to find a remedy to repair the 482,000 VW diesel cars in the U.S. as soon as possible. On Sunday, it launched the website vwdieselinfo.com to tell VW diesel owners about the company's plans to fix their vehicles.

Shares of Tenneco, which makes emissions systems and gets 8% of its revenue from VW, sank almost 8% last week, while those of BorgWarner, which generates 17% of its revenue from the auto maker, fell 6%, finishing the week at $40.

BorgWarner recently opened plants in Portugal and South Korea, partly to produce more components used in starting diesel engines.

Continental, a German supplier of engine components, also was under pressure. Its stock lost nearly 6% of its market value last week.

Closely held Robert Bosch GmbH, the German giant that supplied the components now at the center of the emissions probe, has said VW was responsible for how the parts were installed.

On Friday, the EPA indicated it would step up scrutiny of diesel vehicles by overhauling the way it oversees the industry's compliance with emissions standards.

The regulator sent a letter to auto makers saying that it will conduct tests of 2015 and 2016 vehicles under normal driving conditions, rather than accepting lab results, as it has done in the past.

In the U.S., diesel engines are largely confined to heavier trucks, with diesel-powered cars representing just a small part of the passenger-car market. But diesel is dominant in Europe, accounting for more than 50% of the passenger-car market in 2015, according to Barclays.

Before the scandal broke, J.D. Power & Associates expected diesel to expand to 7% of the U.S. light-vehicle market by 2017 from 3% this year.

Barclays analyst Brian Johnson suggests those growth expectations need to change, both in the U.S. and Europe. And that will squeeze some parts makers.

"Whatever the specifics that emerge from a VW investigation, we believe strongly that the VW scandal will heighten the pressure on diesel in Europe," he said in a research note last week.

"The end result of the VW issues will be to accelerate a move away from diesel in the European mass market, pressuring suppliers leveraged to diesel," Mr. Johnson said.

Mike Jackson, chief executive of AutoNation Inc., the largest U.S. auto retailer, said it would tough to rebuild trust with potential diesel buyers in the U.S. "It is another black eye for diesel engines overall," he said.

Mr. Johnson of Barclays added that auto makers might need to accelerate development efforts of electric vehicles, hybrid and more-efficient gasoline engines.

That could help parts makers, since many of the same companies will have to supply those component. But their investments in diesel-powered cars could be lost if the industry shifts to those alternatives.

VW scandal: German prosecutors probe Winterkorn as Volkswagen emissions-rigging crisis spreads to 2.1 million Audi cars and Skoda models
By Julia Bradshaw10:31AM BST 28 Sep 2015

Prosecutors in Germany have opened a criminal investigation into former Volkswagen chief executive Martin Winterkorn in the wake of the emissions-rigging scandal.

The probe is understood to concentrate on accusations of fraud after it was revealed that VW had fitted 'defeat' devices in millions of its diesel cars worldwide to cheat government emissions tests.

The investigation aims to establish who was responsible, according to the statement from prosecutors in Braunschweig, Germany, and will look at Mr Winterkorn's role in the worst crisis to hit VW in its 78-year history.

The prosecutors have also received a number of criminal complaints, including one from Volkswagen itself.

Winterkorn quit saying he was "not aware of any wrongdoing on my part"

Under the German system, anyone can file a criminal complaint with prosecutors, who then must examine the complaint and decide whether there is enough evidence to open a formal investigation and for charges to be brought.

It is essentially the equivalent of a police investigation in the UK.

Prosecutors say it is too early to determine if and when they may try and interview Mr

Winterkorn himself.

"This is a very broad case and in other such investigations it has taken many months, sometimes years," a spokesman said.

Mr Winterkorn stepped down as CEO last week and was replaced by former Porsche boss Matthias Mueller after the emissions-rigging scandal wiped billions of pounds off the value of VW and tarnished its previously solid reputation for reliability and quality.

Mr Winterkorn has denied knowing about the pollution-cheating software, and issued a statement at the time of his resignation saying: "I am doing this in the interests of the company even though I am not aware of any wrongdoing on my part."

Dr Hans-Christoph Hirt, a director at fund manager Hermes, criticised VW's choice of corporate insiders to take charge of the company, saying the move "raises some real doubts whether the key shareholders have recognised the need for fundamental reform and a real new beginning".

He said: "Following intensive engagement with Volkswagen on corporate governance issues between 2006 and 2009, we have repeatedly raised concerns about aspects of Volkswagen's corporate governance.

"We plan to attend the Extraordinary General Meeting of Volkswagen on November 9 and on behalf of a group of investors will explain our concerns and suggest changes to the company's corporate governance and culture to other shareholders and the management and supervisory boards."

The news came as Audi announced that the device used in parent company Volkswagen's cars to manipulate emissions tests was also fitted in 2.1 million of its own luxury cars.

Of the 2.1 million autos, some 1.42 million diesel-powered Audi vehicles are registered in Western Europe, with 577,000 in Germany.

There are almost 13,000 cars containing the cheat software in the United States, a spokesman for Ingolstadt-based Audi said today.

The engine in question was built into 1.6-litre and 2-litre turbo diesel models in the A1, A3, A4, A6, TT, Q3 and Q5 ranges.

The cars involved have engines in the "euro 5" emissions category. Those with the newer "euro 6" engines aren't affected by the emissions scandal.

"We're working at full speed to find a technical solution," said Juergen de Graeve, a spokesman for Audi.

"Once we have that solution, we'll write to customers and we'll upgrade the cars so that

they're within emissions regulations."

Skoda, which is also part of the VW family, has said that 1.2 million of its cars worldwide contain the software cheat, according to reports.

Volkswagen shares have fallen by more than 7pc so far today.

It has also emerged that VW has suspended the R&D chiefs of its core VW brand, luxury division Audi and sports-car maker Porsche, sources familiar with the matter told reporters.

The carmaker's supervisory board last Friday agreed to put a number of employees on leave until the details of affair were cleared up.

VW sparked global outrage last week when it admitted that 11 million of its diesel cars are fitted with special gadgets that activate pollution controls during tests but secretly turn them off when the car is on the road.

The deception has wiped billions off the value of the car giant and is set to land the German auto maker with substantial penalties and recall costs as governments and regulators around the world launch investigations - some of the criminal - into the scandal.

The nations carrying out probes include the UK, South Korea, India, Brazil, Australia, France, Italy, South Africa and Norway - whose economic crime unit has opened an investigation.

The US Justice Department has also launched a criminal probe.

Executives at VW have been accused of masterminding the emissions scandal from the company's headquarters in Wolfsburg.

The chain of command of those involved in the rigging deception stretched all the way back from the US to VW's home patch, it has been claimed, with executives in Germany controlling the key aspects of tests which the firm now admits were manipulated.

It was said that the cars that missed US emissions targets were reported to managers in Wolfsburg.
Testers at a California site evaluated vehicles and results were sent back to Germany before being passed to the US Environmental Protection Agency.

If any car failed to meet emissions targets, a team of engineers from Volkswagen headquarters or Audi's base in Ingolstadt was flown in.

UK Prime Minister David Cameron has condemned Volkswagen over its rigging of emissions tests.
"If companies are breaking the rules and fiddling their figures, that is unacceptable," Mr Cameron said as he flew to New York for a visit to the United Nations. "Emissions

standards matter and they have to be properly policed and delivered."

Any move to restrict sales would be "all a matter for the Transport Department," he said. German authorities have also demanded the carmaker present a timetable for fixing affected vehicles.

The regulators have asked VW to come up with a plan by October 7 to show when its cars will meet emissions requirements.

The German government has also insisted that it did not know about the rigged diesel emissions tests at VW before the story broke.

"The transport minister found out about the allegations of manipulation the weekend before last," a spokesman said.

"We had no previous knowledge that this system was being used."

Volkswagen has set aside €6.5bn to cover damages including fixes for the vehicles, potential regulatory fines and lawsuits, but the cost of the fallout is expected to be much larger.

The FBI in Detroit is reportedly handling a US criminal investigation of the German company, while 27 state attorney generals have unleashed a joint investigation into the blighted car maker.

Thse 27 states are reportedly going to send subpoenas to the company - these are essentially writs compelling testimony or evidence to be produced or face a penalty.

Private law firms are also lining up to take on VW, with a class action suit already being filed by a Seattle law firm.

The automobile giant already faces at least 60 lawsuits filed in federal courts in the US by consumers alleging the company committed fraud by cheating on emissions tests, which means their cars might not be as efficient as they believed them to be.

Dutch investor group VEB, which represents shareholders, has issued a liability claim against Volkswagen for the losses incurred by investors in the wake of the emissions fraud.

The group said: "The liability in question concerns the incorrect, incomplete and misleading information provided by Volkswagen…this manipulation kept the Volkswagen share price artificially high.

"In doing so Volkswagen acted unlawfully; not only towards car owners but also its own shareholders."

Meanwhile, European environmental organisation, Transport & Environment, has said it

has found some new models of Mercedes, Volkswagens, BMWs and other new cars consume much more petrol than lab tests claim, according to reports from PA.

The organisation said it had found no proof the cars are equipped with the same sort of "defeat devices" installed on diesel-powered Volkswagens, but called on European Union governments to broaden their probes into the scandal to cover petrol cars as well.

Both the EU and US have announced plans to crack down on the way car emissions are measured.
Currently, manufacturers test emissions in near-perfect lab settings, using smooth tyres unsuitable for roads, engine lubricants so expensive they're beyond the reach of most consumers and even clip off wing mirrors to achieve required emission results.
US regulators and the European Commission have both said they will introduce rules forcing manufacturers to test car emissions under real world road conditions.

The EU is expected to introduce new legislation in early 2106, although French ministers on Thursday called for this to be brought forward to before the end of the year.

New VW boss Matthias Mueller has pledged to win back the trust of customers.

"My most urgent task is to win back trust for the Volkswagen Group by leaving no stone unturned and with maximum transparency, as well as drawing the right conclusions from the current situation," he said on Friday.

Despite the turmoil at VW, the European Central Bank has not suspended the purchase of assets backed by VW loans, under its quantitative easing programme.

Contrary to reports over the weekend, the latest list of eligible collateral purchased by the ECB still includes securities issued by the carmaker.

Dispatch Times:
http://www.dispatchtimes.com/what-to-do-if-you-have-volkswagen-affected-by-the-emissions-scan/106617/

What to do if you have Volkswagen affected by the emissions scan
BY NEWSMEDIAON SEPTEMBER 28, 2015

Regulators will add more spot-checks to cars already on the road as part of a toughening of USA environmental oversight following Volkswagen's admission that it fitted as many as 11 million diesel cars worldwide with software that rigged pollution tests.

The software tells a auto when it is under an official test, triggering emissions control systems that do not seem to be operating under normal driving conditions.

Volkswagen appointed Matthias Mueller as its new chief executive officer, to help the

German automaker recover from a scandal over its rigging of USA vehicle emissions tests.

"We are not going to tell them what these tests are; they do not need to know", said Christopher Grundler, director of the EPA's Office of Transportation and Air Quality.

EPA officials insisted on a call with reporters Friday that the previous testing procedures were sophisticated and sufficient to accurately detect the emissions from the diesel cars as long as a manufacturer is not deliberating trying to cheat the process.

The EPA move comes amid a widening scandal over Volkswagen's diesel vehicles, as the automaker has admitted it installed a cheat device to remove nitrous oxide from exhaust emissions during lab testing. Volkswagen CEO Martin Winterkorn issued an apology, stating that he was "deeply sorry that we have broken the trust of our customers and the public".

The EPA's findings regarding the scandal saw that 482,000 cars in the U.S. were involved including the brands made by VW such as the Audi A3 and the VW models Jetta, Beetle, Golf and Passat.

The US Department of Justice (DoJ) has said that the United States would be taking part in an investigation by the Environmental Protection Agency (EPA) into the vehicle company.

Why did successive governments not discourage the proliferation of diesel vehicles which now account for about half of new cars in Britain?

The Air Resources Board sent a letter to all vehicle manufacturers Friday notifying them of the change that will be effective immediately.

Private owners of the 2009-15 VW and Audi models equipped with the violating 2.0-liter diesel may continue driving the cars, and do not have to do anything until Volkswagen of America and the EPA agree on a timeline for a recall.

The Academic Paper That Broke the Volkswagen Scandal
Last year, a group of researchers at West Virginia University uncovered one of the biggest

frauds in automotive history while working under a small $50,000 grant.
BOURREE LAM 1:23 PM ET

Every day since the story first broke a week ago, the ripples of Volkswagen's scandal have extended further and further. Initially, the Environmental Protection Agency ordered Volkswagen to recall nearly half a million vehicles after discovering illegal devices intended to cheat emissions testing. Then, Volkswagen announced the number of vehicles affected is closer to 11 million worldwide—and that the company has set side $7.2 billion to fix the problem. Volkswagen's CEO at the time, Martin Winterkorn, soon resigned.

The company's board is expected to pick Matthias Mueller, the chief executive of Porsche, to take over. There are reportedly nearly 30 class-action lawsuits pending from car owners in all 50 states, plus 5 provinces in Canada. All these furious drivers bought their cars believing that they were highly fuel-efficient—which appears to not be the case, affecting their resale values significantly.

But how did this whole thing begin? At a small lab in West Virgina, it turns out. In 2012, a group of researchers at West Virginia University won a $50,000 grant from the International Council on Clean Transportation to do performance testing on clean diesel cars. Arvind Thiruvengadam, a research assistant professor in mechanical and aerospace engineering, told NPR this week that the team was merely excited do the research—which involved driving the clean diesel cars outside the lab—and write a journal paper based on the data. They never expected that they would discover one of the biggest frauds in automotive history.

When Thiruvengadam and his colleagues tested Volkswagen's clean diesel cars, they found discrepancies up to 35 times the expected emissions levels. The researchers suspected cheating, but couldn't be sure. David Carder, another researcher on the West Virginia University team, told Reuters that the fallout at hand is surprising because this data was made public over a year and a half ago.

The stakes were upped when the Volkswagen cars in question were tested by the California Air Resources Board (CARB) in an investigation starting May of last year, and the CARB and EPA started discussions with Volkswagen on why there were such discrepancies. Volkswagen insisted to EPA officials that the discrepancies were due to a technical issue rather than deliberate cheating. Only when the EPA threatened not to approve Volkswagen's 2016 clean diesel cars for sale in the U.S. did the company finally fess up.

Volkswagen will survive this scandal (even though its stock has plunged 30 percent, wiping out a quarter of its market value), but now the future of diesel cars are at stake and it's expected that the consumers who wanted clean diesel cars for their greenness will likely switch to hybrids, while those who care for performance might try to dodge the recall. Either way, Volkswagen will be held responsible for clean diesel's coming existential crisis.

Does EPA's Response To Volkswagen's Emissions Cheating Go Far Enough?
By Cole Stangler

Auto regulators are now on the offensive after being deceived by Volkswagen for years. They unveiled a response Friday to the company's stunning admission that it systematically cheated on emissions tests from 2009 to 2015. In a letter to automakers, the U.S. Environmental Protection Agency said it will bolster testing procedures to detect so-called defeat devices like the ones Volkswagen used to shut down pollution control systems outside of testing conditions.

Jesse Prentice-Dunn, a policy analyst at the Sierra Club, applauds the move. But he says "long-term" fixes are still needed. "The testing regime needs to be revamped."

Critics have long said as much. Under the current testing system, automakers in the United States conduct their own examinations and report the data to federal officials. The EPA, meanwhile, conducts spot checks, but its resources are stretched thin.

Dan Becker is the director of the safe climate campaign at the Center for Auto Safety. For companies to respect emissions standards, he says, officials need to remove the tests from private hands and transfer them to labs with federal supervision. "Right now, you've got the foxes in control of the chicken coop, and that's never going to be a good show."

In an ideal world, Becker says, automakers would simply follow the law. But in the last few decades, companies have shown a remarkable penchant for gaming the standards, and the current structure of the testing system makes it exceedingly easy to do so.

"If these companies were being honest, we wouldn't need an elaborate system to make sure they don't cheat," Becker said. "But they've proven that they do cheat." Not just Volkswagen -- but "virtually every major automaker," he asserted.

A History of Gaming The System

It started in the 1970s, just after the EPA was created and began to regulate auto emissions under the Clean Air Act. Volkswagen, in fact, was among the first to equip its cars with defeat devices to override emissions control systems. In 1973, it confessed to installing them on 25,000 cars. The following year, Chrysler was forced to recall more than 800,000 cars after it was found to have installed a similar device in radiators.

The 1990s saw a couple of major scandals. In 1995, General Motors settled with the Justice Department and the EPA for $45 million, acknowledging it installed a computer chip in 500,000 Cadillacs that tripled the amount of carbon monoxide output when the cars' heating and cooling systems were running. Three years later, Caterpillar, Mack Trucks and Volvo Trucks reached a similar settlement, worth $1 billion, for equipping trucks with defeat devices.

Kia and Hyundai followed suit more recently. Last November, the South Korean corporations copped to overstating fuel economy standards on 1.2 million cars from 2010 and 2012, settling with the Justice Department and the EPA for $300 million.

A representative for the Alliance of Automobile Manufacturers, a trade group that represents automakers operating in the United States, declined to comment.

What Is To Be Done?

The Sierra Club's Prentice-Dunn says one path to reform could simply be to increase the number of spot checks. Indeed, Christopher Grundler, director of the EPA's Office of Transportation and Air Quality, recently told the Associated Press that the agency may soon do this.

Grundler was less forthcoming about the EPA's plans to enhance detection of defeat devices -- the subject of Friday's letter to automakers. On a call with reporters, he wouldn't say what changes the agency is enacting to audit lab results submitted by car companies.

"They don't need to know," he said, of the automakers. "They only need to know that we will be keeping their cars a little bit longer, and we're going to driving them more."

Becker says more oversight is a good step, but regulators need to go further by eliminating their reliance on companies' test data altogether.

"This is an industry that has proven it's not trustworthy," said Becker. "The EPA shouldn't trust them when they say, 'our vehicles meet your standards, everything's just peachy keen.' The government needs to set up a better testing system and not rely on the auto companies' assertions."

He's not sure exactly how that would look -- whether it would be in-house or conducted at independent labs with federal supervision -- either way, he says, it would need to be firmly outside the control of companies. Taxpayers, in theory, could cover a portion of the cost, but companies should be forced to foot most of the bill.

Congressional Republicans, who have made frequent targets of the EPA, would likely oppose such a plan. Since 2010, the agency has seen its budget decline by a fifth, or about $2 billion. Earlier this month, 20 Republican members of Congress filed articles of impeachment against Gina McCarthy, head of the agency.

Luke Tonachel, director of clean vehicles and fuels at the Natural Resources Defense Council, says all this makes it harder for the agency to do its job. "If the EPA's resources are constantly under attack, it's only gonna be harder for them go out and catch the cheaters."

Fortune:
http://fortune.com/2015/09/25/gm-volkswagen-emissions/

Former GM Vice Chair: "I almost feel sorry" for Volkswagen
by Chris Matthews

Bob Lutz says the competition wondered how VW could get low emissions cheaply

For six years, Volkswagen has been installing software in its cars to help them cheat on EPA emissions test. As former GM Vice Chair Bob Lutz told CNBC Friday, the rest of the industry was wondering just how the company was able to get clean emissions so cheaply.

Lutz said that he consistently pressed his engineers to figure out what his competitor was doing, ""They said, 'We can't answer that question," according to Lutz. "Honda asked the same question. They couldn't figure it out either because with near identical engines and hardware from the same suppliers, they could not get themselves to pass."

Lutz also predicted that to fix the problem will be, "incredibly expensive" after factoring in government fines and consumer lawsuits for complaints like loss of value. He even went so far to say that he "almost" feels sorry for his former competitor.

International Business Times:
http://www.ibtimes.com/volkswagen-whistleblower-we-gave-epa-diesel-emissions-data-2014-2114511

Volkswagen Whistleblower: "We Gave EPA The Diesel Emissions Data In 2014"
By Mike Brown

The Volkswagen scandal has shaken the automotive world. It all started with two men: Peter Mock and John German. The pair worked with West Virginia University to try to show that clean emissions tech doesn't necessarily effect automotive performance. Instead,

they discovered that the chosen cars were pumping 40 times more emissions into the air than they were supposed to. They submitted their findings to the California Air Resources Board and the federal Environmental Protection Agency.

This week, German, senior fellow at the International Council on Clean Transportation, suddenly became one of the key figures in a story about how the global car manufacturer had cheated on EPA emissions tests. The shocking revelations have had widespread impact on the industry and started an international conversation on emissions testing. They also cost Volkswagen CEO Martin Winterkorn his job. Here, German speaks to International Business Times about how Volkswagen got away with it, the wider implications, and what happens next.

International Business Times: Now, as I understand it, Volkswagen was using a "defeat device" to measure the conditions of the car, but this wasn't actually a device. It was a piece of software, correct? What was that software measuring for?

John German: We don't know. You are correct it is software, it has to do with the computer looking for the conditions under which test procedure was conducted, and if it detects the conditions, the emission controls behave the way they were designed. But if it does not detect those conditions, it switches to a different control where it reduces the effect of the system. The specifics as to how they reduce effectiveness, though, we don't know. There's quite a number of ways they could detect how they could see that the car was being tested.

IBT: Who could have known about this?

German: One aspect that's really interesting is that we turned data and report over to CARB and the EPA back in May 2014 and they discussed the problems with Volkswagen. Then in December 2014, Volkswagen issued a field fix, and they reflashed the computers in the cars to install the field fix. A few months later they assessed, and found the defeat device was still in the field fix. That is incomprehensible to me, so the interpretation is that this was only a relatively small part of the company.

IBT: Is this something that's ever happened before?

German: There have been a number of other defeat device cases. The best-known case was in the late 1990s with heavy-duty engine manufacturers, ones for really big freight trucks. They did something similar; they were concerned with driving long distances. So they looked for a steady state highway speed for more than x mins, after which they would change calibrations, pushing the NOx up.

IBT: But I'm assuming before they didn't have as advanced computers and electronics. How did they control it before?

German: The systems were simpler. Before NOx after treatment, it was all in calibration. One example of this was what's known as exhaust gas recirculation. That was the first step of control. You could put in one of those to reduce NOx, but it would also increase fuel

consumption, so you could switch it off.

IBT: When will we find out what Volkswagen was doing? Are we talking more in months or years?

German: We will only find out if CARB or EPA reveal it. It might be part of the settlement with Volkswagen, as part of the legal agreement. There is a good chance that the EPA will release the info, but we're probably talking more in months. At this stage, though, it's definitely in Volkswagen's interest to get it fixed and behind them as fast as possible.

IBT: Could we conduct tests to find out for ourselves how Volkswagen were doing this?

German: Maybe. It would be difficult. The kind of time and expertise it takes to reverse-engineer calibrations ... these computers are really powerful and complex, and it would take a large amount of time and expertise.

IBT: But we know the car was looking for certain conditions. What are these conditions they could have been measuring for?

German: There are several factors. On an official test the non-drive wheels don't spin, the front wheels do not turn. The test is run at a consistent ambient temperature. It's always run with a cold engine, and the test has a defined speed trace, i.e. the speed for each second. Volkswagen could have looked for any of those.

IBT: Thank you for your time, this has been very interesting. Is there anything else you wanted to say about this that you don't think we covered?

German: The main point is that governments need to do a better job of oversight and enforcement. Worldwide, in China, India, Brazil ... the primary lesson is that there needs to be better oversight and more data.

EPA works with Canadian regulators to retest VW vehicles
U.S. regulators warn they will revamp testing protocols after learning of VW cheat device

The U.S. Environmental Protection Agency is looking to revamp the way it tests emissions for all automobiles in the wake of the scandal over Volkswagen's manipulation of emissions data.

The EPA will also be working closely with Environment Canada, which has an "excellent laboratory," to co-ordinate widespread testing around the Volkswagen emissions, EPA officials said in a conference call on Friday.

Affected vehicles have yet to be recalled, but the EPA said it is looking for "recall solutions." Part of the problem is that there is no fix that won't negatively impact vehicle performance.

An estimated half million vehicles in the U.S. are affected, with Environment Canada estimating 100,000 VW diesels are in service in Canada.

The EPA said it is sending a letter to automakers outlining plans for more extensive testing of all vehicle models.

That echoes an initiative by European regulators, who plan to move in 2017 to a system of road testing for vehicle emissions standards.

Light commercial trucks

The EPA move comes amid a widening scandal over Volkswagen's diesel vehicles, as the automaker has admitted it installed a cheat device to remove nitrous oxide from exhaust emissions during lab testing.

On Friday, Germany's transport minister said that light commercial trucks made by Volkswagen appeared to have the same software geared toward cheating on U.S. emissions tests.

Transport Minister Alexander Dobrindt told lawmakers Friday that 2.8 million vehicles in Germany may be affected.

Meanwhile, Daimler AG, the maker of Mercedes cars, is rejecting claims by a German environmental group that it appears to have been involved in manipulation of emissions data.

The Deutsche Umwelthilfe group said Friday it had information that almost all German manufacturers of diesel cars exceed emissions limits and speculated that the cars were declared road-worthy by regulators because of cheat devices.

"We sharply deny the allegation that we manipulated our cars during emissions tests. We never did and do not now use a defeat device," Daimler said in a statement.

Questions over emissions testing

Volkswagen cars as far back as 2009 are equipped with the defeat software that is geared toward passing emissions standards.

The revelation has put the EPA, and testing agencies around the world, on the alert.

Chris Grundler, head of the EPA's office of transportation and air quality, was clearly on the defensive, saying the EPA had left it to European regulators to do more extensive tests of

diesel as the fuel is in wider use there.

It wasn't the EPA that uncovered the high nitrous oxide emissions from VW diesel cars, but the International Council on Clean Transportation (ICCT), a nonprofit research organization based in Virginia.

"Do I wish we had uncovered it sooner? Absolutely," he said.

VW was able to fool the EPA because the agency only tested the cars on treadmill-like devices called dynamometers and didn't use portable test equipment on real roads. The software in the cars' engine-control computers checked the speed, steering wheel position, air pressure and other factors to determine when dynamometer tests were under way. It then turned on pollution controls that reduced the output of nitrogen oxide, an ingredient in harmful ozone, the EPA has said.

The agency does have on-road testing equipment, but it is used to monitor automaker gas mileage estimates and heavy-duty diesel trucks, which create more emissions.

"It's not a question of equipment or technology or capability. It's a question of where we deploy those resources," Grundler said.

Any new testing will include investigations that will uncover any software designed to fool emissions testers, Grundler said.

More extensive road testing is also on the way, he warned automakers, though he did not specify exactly which tests the EPA plans.

The scandal has also exposed holes in the European testing system, where tests are done in laboratory conditions on special pre-production models provided by the manufacturers. Norway, France and Italy announced moves today to investigate VWs sold in their countries.

Europe's tests have not been upgraded since 1996 and critics say its testing is less rigorous than North American testing.

The EU has proposed real-world testing from 2017, with new proposals to close loopholes and design testing to more closely resemble real-world road conditions.

ICCT testing of diesel cars hints at trouble for many automakers around diesel emissions, with poor results for Volvo, Renault and Hyundai as well as Volkswagen.

EPA expands emissions tests in wake of VW scandal
By Greg Gardner
The EPA also will test diesel vehicles produced by other automakers.

The U.S. Environmental Protection Agency will introduce new tests to detect devices like the one Volkswagen used to cheat on its emission test to comply with the Clean Air Act, agency officials said today.

The German automaker said Matthias Mueller, currently the head of its Porsche unit, will become CEO, replacing Martin Winterkorn who resigned earlier this week because of the emissions cheating scandal.

The EPA apply the new regimen to diesel vehicles produced by other automakers. The agency is also asking owners to allow EPA researchers to test their diesel vehicles to learn more about how the German automaker disguised their violations, that could lead to a fine of up to $18 billion in the U.S. alone. More broadly Volkswagen has said 11 million vehicles worldwide used some type of software to game various countries' environmental standards.

"We're going to adapt new practices and more demanding tests to improve our enforcement," said Chris Grundler, director the EPA's office of transportation & air quality. "We are not going to tell manufacturers what these new tests are. They don't need to know."

In the U.S., the EPA found that 482,000 Volkswagen cars sold between the 2009 and 2015 model year used a defeat device when testing the vehicles.

They include:

Jetta (model years 2009-15)
Beetle (model years 2009-15)
Audi A3 (model years 2009-15)
Golf (model years 2009-15)
Passat (model years 2014-15)

Without the defeat devices, which were deactivated after Volkswagen met the emission requirements, the VW and Audi vehicles were emitting nitrogen oxides (NOx), a greenhouse gas, at levels up to 40 times the permissible standard.

Grundler and Janet McCabe, EPA acting assistant administrator for the office of air and

radiation, asserted that neither their agency nor the California Air Resources Board, which can also penalize Volkswagen and Audi, don't allow any manufacturer to "self-certify," or conduct their tests without regulatory involvement.

EPA and CARB uncovered the defeat device software after independent analysis by researchers at West Virginia University, working with the International Council on Clean Transportation, a nongovernmental organization.

Grundler said EPA has the money and staff to expand its emission testing.

"We have the equipment. We have the people. We have 23 of these measurement systems and they are not cheap," he said.

Washington Post:
http://www.washingtonpost.com/business/economy/epa-to-begin-more-rigorous-testing-of-all-diesel-cars-after-vw-scandal/2015/09/25/f20fa39a-6393-11e5-8e9e-dce8a2a2a679_story.html

EPA to begin more rigorous testing of all diesel cars after VW scandal
By Thad Moore

Federal regulators are launching more aggressive testing of diesel-engine cars across all manufacturers in the wake of the Volkwagen emissions-cheating scandal, the Environmental Protection Agency said Friday.

The EPA also says it will add additional tests designed to ferret out “defeat devices” like the software VW used to circumvent emissions tests.

The agency had been focused its diesel testing on big-rig trucks because they are more common than diesel cars and account for more pollution in the U.S., said Christopher Grundler, director of the EPA’s Office of Transportation and Air Quality.

The EPA will begin testing cars Friday, Grundler said, and it will seek out test vehicles from rental car fleets and consumers. The agency doesn’t know how long the testing would take, but Grundler said it is working with regulators in California and Canada to speed the process.

VW acknowledged that 11 million of its vehicles worldwide, including nearly 500,000 in the United States, were involved in a deception that allowed the vehicles to pass emissions tests while emitting nitrogen oxide at up to 40 times the federal standard. Its’ CEO, Martin Winterkorn, stepped down this week and the company is under criminal investigation and faces billions in fines. VW also set aside more than $7 billion to fix the problems with its cars and begin to repair its reputation with customers.

Neither the EPA nor Volkswagen have said how long it will take to fix the nearly half-

million cars in the U.S. with defeat devices. But it expects cars in the 2015 model year will be patched "relatively quickly," Grundler said.

Older versions of the Passat should be fixed soon after that, but other models will take longer because designing a solution "will require additional engineering development that will take longer," Grundler said.

US News & World Report:

EPA Beefing Up Emissions Tests in Wake of VW Scandal
The agency also says it plans to test gasoline and diesel vehicles that are on the road today.
By Alan Neuhauser

One week after Volkswagen copped to cheating on federal emissions tests of popular VW and Audi "clean-diesel" cars, the Environmental Protection Agency sent a letter to vehicle manufacturers Friday announcing it was toughening its emissions tests. The agency also will be launching audits of every current make and model of light-duty diesel passenger vehicle, reflecting concern that cheating might be widespread.

The expanded checks will include on-road testing to better emulate real-world driving conditions. Some critics had previously alleged that the tests were outdated and easily outsmarted. The new audits will also include gasoline vehicles, an EPA official said

In this photo taken Feb. 14, 2013, a Volkswagen logo is seen on the grill of a Volkswagen on display in Pittsburgh. The Environmental Protection Agency (EPA) says nearly 500,000 Volkswagen and Audi diesel cars built in the past seven year are intentionally violating clean air standards by using software that evades EPA emissions standards.
RELATED

Volkswagen Sees Billions Erased From Market Value After Rigging Claims

The agency also confirmed that affected VW and Audi vehicles – diesel Passats, Jettas, Beetles, Golfs, and A3s, together numbering around 500,000 cars in the U.S. – would be recalled as the German auto group devises solutions to make the cars compliant with U.S. air standards.

"These violations are very serious," Janet McCabe, acting assistant administrator for the EPA's Office of Air and Radiation, said during a call with reporters. "VW was concealing the acts from EPA, from the state of California, and from consumers."

The California Air Resources Board tests vehicle emissions and was among the groups that uncovered the cheating regimen.

Volkswagen Group CEO Martin Winterkorn resigned Wednesday amid the continuing fallout from the scandal, stating he was "shocked by the events of the past few days" and "stunned that misconduct on such a scale was possible in the Volkswagen Group."

VW and Audi may ultimately face a penalty of up to $18 billion, or $37,500 per vehicle in violation. By comparison, Hyundai and Kia were penalized $300 million last year for overstating vehicles' fuel economy and greenhouse gas emissions.

The Justice Department has also reportedly opened a criminal investigation of Volkswagen AG.

EPA officials intimated that they expected VW and Audi penalties – as well as the expanded audits – to reflect the flagrancy of the violations. The cars, from model years 2009 through 2015, contained "defeat devices" buried in the software governing their engine controls. These lines of code automatically reduced emissions of nitrous oxide, or NOx, during tests, then switched off the restrictions during normal driving.

The cars were found to emit as much as 40 times the legal limit of NOx, the EPA said, which causes smog and a range of health problems. With 11 million of the vehicles on the road worldwide, one "back-of-the-napkin" calculation by Vox's Brad Plumer found they churned out as much as 20 times the NOx of a typical power plant, contributing to anywhere from dozens to hundreds of premature deaths.

"The facts before us show us that this firm sadly developed a very sophisticated scheme to defeat this test using software very deep in the engine control," Christopher Grundler, director of the EPA's Office of Transportation and Air Quality, said during Friday's call.

The EPA is partnering with the California Air Resources Board and bringing about Environment Canada – that nation's version of the EPA – to carry out its audits of gas and diesel vehicles. The agency said it would test cars from private owners who volunteer, as well as vehicles from rental companies. Officials declined to speculate how long the testing would take or how much it would cost the agency, but did acknowledge that expected recalls of VW and Audi vehicles would take longer for older models.

"We expect the first generation of vehicles, all pre-2015 vehicles except for the Passat, will require additional engineering … that will take longer," Grundler said.

VW's four-cylinder diesel vehicles for 2016 also have not yet received required emissions certification from the EPA because officials aren't yet certain the vehicles will perform as required.

The EPA's testing procedures date to 1975 and were most recently updated in the "early 2000s," Grundler said, when they were expanded to reflect aggressive driving, high-speed driving, and driving in hot and cold weather.

In light of the VW and Audi practices, he added, "we are going to be adopting some new

approaches and new tests as a continuous improvement of our oversight."

CNBC:
http://www.cnbc.com/2015/09/25/epa-expect-range-of-penalties-for-vw-amid-scandal.html

EPA: Expect range of penalties for VW amid scandal
Fred Imbert

The Environmental Protection Agency said Friday it will be cracking down on Volkswagen after the German automaker admitted it added software on its vehicles to deceive emissions tests.

The EPA said it will hit the company with a range of penalties as a result of the investigation, but added that it has not issued a recall since the discovery.

"We are upping our game," Chris Grundler, head of transportation and air quality at the Environmental Protection Agency, told reporters in a teleconference.

The automaker, one of the largest car companies in the world, could face fines of $37,500 per vehicle in the U.S., the EPA said last week. With around 482,000 of its diesel vehicles sold in the U.S. since 2008, this could mean a penalty of up to $18 billion.

Rain clouds are seen over a Volkswagen symbol at the main entrance gate at Volkswagen production plant on September 23, 2015 in Wolfsburg, Germany. Volkswagen CEO Martin Winterkorn and other members of the supervisory board are believed to be meeting inside the headquarters to discuss the Volkswagen Diesel emission scandal, which affects 11 million vehicles worldwide.

Europe's carmakers caught up in VW storm
The agency also said it has already begun new testing of all diesel-powered vehicles, and is planning even more new tests.

The EPA said it will improve its ability to detect so-called defeat devices or software that can reduce emissions during testing. But it will not tell automakers specifically how it is improving the testing.

"They don't need to know," Grundler said.

It added that the vehicles are safe to drive. Nevertheless, it also said these events make it clear it needs to improve its oversight over automakers and that Canada's Department of the Environment would be an active partner in testing vehicles more quickly.

Volkswagen German-listed shares have fallen nearly 30 percent in the last week, according to FactSet.

VW cheating scandal prompts EPA to widen testing of diesel cars
By JERRY HIRSCH

Working with regulators in California and Canada, the Environmental Protection Agency launched a new testing program Friday to look at the emissions from every make and model of diesel passenger cars on U.S. roads.

The increased oversight is a response to the discovery earlier this month that Volkswagen was using sophisticated software to cheat on pollution tests on 482,000 diesel vehicles sold in the U.S.

The automaker, which faces a federal criminal investigation and other regulator sanctions, admitted cheating and said the software could be on as many as 11 million vehicles worldwide.

"Clearly this is a concern for air quality and public health," said Janet McCabe, acting assistant administrator of the EPA office of air and radiation. "The Volkswagen violations before us now show that we must continue to improve our oversight."

Both the California Air Resources Board and the Environment Canada will join in the testing.

"This will allow us to move more quickly to test more models," said Christopher Grundler, director of the EPA's office of transportation and air quality.

The agency sent a letter Friday to all automakers explaining that their vehicles will undergo extra scrutiny.

The EPA said it now will test or require testing on any vehicle in a setting that emulates normal driving specifically for investigating the presence of a so-called defeat device, the industry term for systems that hide a vehicle's true emissions.

This will be in addition to the five standard emissions tests all new vehicles undergo and may require additional time, the agency said.

The agency and its partners also will use portable devices to measure the real life emissions

of vehicles as they are driven on open roads, Grundler said.

Environmental groups welcome testing expansion and said it will deter other automakers from evading emissions regulations.

"EPA is on the job," said Luke Tonachel, director of clean vehicles and fuels project at the Natural Resources Defense Council. "This expansion of testing will is another signal that cheating will not be tolerated."

There is no evidence at this point to suggest that any other companies are cheating.

After tips from researchers in Europe and the University of West Virginia, California and federal regulators discovered that VW had buried an algorithm in 100 million lines of computer code in its vehicle electronics that allows the cars to emit up to 40 times the legally allowed amount of nitrogen oxide.

The cars met environmental regulations when tested on a dynamometer -- a kind of treadmill for vehicles -- in a laboratory. But they spewed pollution when driven on roads.

VW's software senses the testing environment by analyzing a variety of data -- steering position, speed, duration of engine operation, barometric pressure and changes in the car's performance.

The affected cars are the 2009 to 2015 Volkswagen Jetta TDI, 2009 to 2014 Volkswagen Jetta SportWagen TDI, 2012 to 2015 Volkswagen Beetle TDI, 2013 to 2015 Volkswagen Beetle Convertible TDI, 2010 to 2015 Audi A3 TDI, 2010 to 2015 Volkswagen Golf TDI, 2012 to 2015 Volkswagen Passat TDI, 2015 Volkswagen Golf SportWagen TDI.

Additionally, Volkswagen suspended new and used sales of the all 2.0-liter TDI four-cylinder diesel engines, including 2015 Beetle, Jetta, Golf, Passat TDI, as well as the Audi A3 TDI. Sales of VW's 2016, 4-cylinder diesel models are held up as they await EPA certification.

Grundler said the EPA is working with Volkswagen to evaluate potential remedies for the diesel vehicles' emission systems. The 2015 models will be the first fixed, followed by the 2012-15 Passats.

Because the range of cars affected include three generations of diesel engines, the remedies for the other vehicles could take much longer to develop.

Other automakers said they are ready for more rigorous testing of their diesel vehicles.

"We are prepared for testing," said Annalisa Bluhm, a GM spokeswoman. "We are not changing our diesel strategy as a result of what is going on with Volkswagen."

The automaker sells diesel pickup trucks and a diesel version of the Cruze sedan.

Bluhm said GM is "committed to the robust emissions compliance of all our vehicles" and expects its employees to know the regulations and "act legally and ethically."

Only about 3% of all autos and light truck sales involve diesel power trains.

According to the Diesel Technology Forum, there are 39 diesel-powered passenger vehicles being sold in the U.S. Those are made by Audi, BMW, Chevrolet, Jaguar, Jeep, Land Rover, Mercedes-Benz, Porsche, Ram and Volkswagen.

Get our weekly business news briefing >>
That number will grow, the forum said, by 15 more vehicles within the next year. Among the new entries will be light trucks from GMC, Chevrolet and Nissan.

Meanwhile, other German automakers issued statements saying that they have not gamed emission testing for their diesel offerings.

BMW said it observes "the legal requirements in each country.... Our exhaust treatment systems are active whether rolling on the test bench or driving on the road."

Mercedes-Benz said that it has never used defeat devices to evade testing, in response to allegations by a German environmental group that other automakers' diesels also exceed smog-forming nitrogen oxide emissions. The company said it sticks to all laws and rules and isn't aware of any measurements showing that its vehicles fail to keep to legal requirements.

Mercedes said it supports efforts to develop new testing methods to measure emissions based on real driving conditions.

The VW cheating scandal prompted the resignation of the automaker's chief executive, Martin Winterkorn. The company is expected to name a new CEO later Friday or in the coming days.

Financial Times:
http://www.ft.com/intl/cms/s/0/8c6d5aec-6392-11e5-a28b-50226830d644.html#axzz3mgG3bZd2

EPA warns other carmakers it will test for defeat devices
Chris Bryant in Frankfurt and Barney Jopson in Washington

The US environmental regulator put all vehicle manufacturers "on notice" on Friday that it will intensify its emissions testing on diesel-powered vehicles to discover whether "defeat devices" were being used more widely.

Janet McCabe, acting assistant administrator of the Environmental Protection Agency, told

reporters: "We are stepping up our testing activities in response to VW's alleged violation."

The new testing regime will start immediately and Christopher Grundler, director of the EPA's office of transportation and air quality, said that for manufacturers it meant "we'll be keeping their vehicles a little bit longer and driving them more".

The EPA's announcement came as Volkswagen's board gathered to appoint a new chief executive to lead the carmaker, with Matthias Müller, head of Porsche, widely viewed as the favourite candidate.

The supervisory board meeting at VW's Wolfsburg headquarters follows Martin Winterkorn's resignation after eight years at the helm of the group.

Mr Müller is close to the Porsche and Piech families, who together control a majority of VW's voting shares, knows Volkswagen inside out and has a reputation for speaking his mind. The company declined to comment.

The board is also expected to decide on Friday which managers must leave the company over the scandal, with attention focusing on high-level engineers and designers.

VW has been reeling since the EPA revealed last Friday that the group had rigged its diesel cars to pass emissions tests, potentially laying itself open to criminal charges and substantial fines.

The EPA said that VW had installed defeat device software that turned off emissions controls during regular driving and turned them on during an emissions test. The software meant cars emitted up to 40 times the amount of nitrogen oxides that US environmental standards allow.

The EPA said 482,000 vehicles sold in the US since 2008 were affected, but VW later raised that figure to 11m worldwide. It said it would take a €6.5bn charge to cover the costs of the crisis.

A senior official at the EPA told the Financial Times that Volkswagen had orchestrated an unprecedented effort to beat the EPA's rigorous testing regime. "The level of deceit the company went through to game the system was enormous," the official said.

The EPA operated a cutting-edge testing regime to police compliance with clean air regulations, the official said, and it took an "elaborate, aggressive, ongoing, co-ordinated effort" to beat it. "We've seen uses of defeat devices, but nothing to this scale," the official added.

Forbes:
http://www.forbes.com/sites/neilwinton/2015/09/25/vw-struggles-to-agree-new-ceo-but-heres-some-advice-for-the-eventual-incumbent/

VW Struggles To Agree New CEO, But Here's Some Advice For The Eventual Incumbent
Neil Winton ,CONTRIBUTOR

A meeting in Wolfsburg, Germany, of Volkswagen executives to appoint a new CEO was dragging on into the evening, suggesting a lack of agreement on who should replace Martin Winterkon.

Winterkorn resigned this week in the wake of the scandal in which VW duped the EPA with false diesel data. VW's shares dived on stock markets, and the company's 20-member supervisory board is apparently torn between appointing the media favourite Porsche CEO Matthias Mueller or VW brand chief Herbert Diess to replace Winterkorn.

Max Warburton, analyst with Bernstein Research, said Diess was his first choice.

"He's the best candidate if VW wants to show everyone – internally and externally – that the regime has changed," Warburton said.

Diess was recently hired from BMW so is not tainted by any of the VW scandals.VWLogo.jpg

"Diess would also be the best choice for shareholders who would like other changes after the EPA scandal has been dealt with. Our second vote goes to Hans Dieter Poetsch. He would be a good option in the short-term as VW needs an eloquent, unflappable face to put in front of U.S. Congress and media," Warburton said.

Poetsch, currently VW's finance chief, was nominated earlier this month as the replacement for Ferdinand Piech as Chairman of the board. Poetsch faces a shareholder vote in November to confirm his appointment.

Whoever gets the new CEO job should do the following, Warburton said.

Offer to buy back and scrap every 2.0 diesel sold in the U.S. – all 482,000 of them – cost $6 billion.

Announce that VW will henceforth abandon all efforts to sell diesel engines in the U.S., but will embrace gasoline and plug-in hybrids.

Send the new CEO to the U.S. Monday to meet government officials, the EPA and media.

Announce the immediate suspension of the 100 engineers most closely linked with the engine and software development.

Announce the cessation of all motorsport activities immediately, turning all the funding over the electric, plug-in hybrid and environmental research in a new research facility located in the U.S. employing U.S engineers.

CNN:
http://money.cnn.com/2015/09/25/news/companies/volkswagen-epa-emission-scandal/index.html?section=money_latest

EPA to automakers: We'll test everyone for VW problems
By Chris Isidore and Ahiza Garcia @CNNMoney

Federal regulators are putting U.S. automakers on notice.
The EPA said Friday it will test emissions at every automaker to make sure no other company is trying to dodge pollution regulations like Volkswagen did.

The agency will send a letter to all manufacturers to notify them that it's stepping up its emissions policing.

The EPA said it will test every model of diesel car, SUV and pickup that's now on the road in the U.S. The testing won't include large vehicles such as semi-tractors and buses, which also use diesel.

It added that the new testing procedures will be more vigorous to prevent automakers from cheating, and will more closely approximate the emissions from a vehicle in real-world driving conditions.

Last week, the EPA found that Volkswagen had falsified pollution tests on 482,000 VW and Audi diesel cars in the U.S.

Those models include the VW Jetta, the Passat from 2014-2015, the Beetle and the Golf from 2009 through 2015, and the Audi A3, model years 2009-2015. Audi is owned by Volkswagen (VLKAY) Group.

Volkswagen manipulated software so its cars would seem cleaner when they were being tested. But when they were on the road, the cars pumped out nearly 40 times the legal level of nitrogen oxide. Volkswagen has since admitted it cheated.

EPA officials insisted on a call with reporters Friday that the previous testing procedures were sophisticated and sufficient to accurately detect the emissions from the diesel cars as long as a manufacturer is not deliberating trying to cheat the process.

Since the EPA plans to test older cars that are no longer available from the manufacturers, the agency said it will borrow cars from individuals as well as businesses, such are rental car companies, which own the vehicles it wants to test.

Volkswagen's directors are meeting Friday to name a new CEO after Martin Winterkorn stepped down earlier this week.

Winterkorn said he was unaware of the emissions cheating and apologized for the possible data manipulation in roughly 11 million cars worldwide.

VW has had to set aside €6.5 billion ($7.3 billion) to deal with the issue, but the final total could far exceed that. The automaker is also facing criminal probes from U.S. state attorneys generals and possibly the federal government. The EPA could impose a civil penalty of $37,500 per violation, which would come to $18 billion.

Volkswagen's share price has plunged 50% in the wake of the scandal.

Newsweek:

EPA to Begin Retesting All Light Diesel Cars on the Road for Defeat Devices
BY ZOË SCHLANGER

The search for more "defeat devices" installed in cars and meant to cheat emissions tests has begun. The U.S. Environmental Protection Agency announced on Friday it would begin systematically re-testing all models of light diesel vehicles currently on the road in the U.S. The goal is to weed out any other potential defeat devices following the discovery that Volkswagen designed and installed software in their cars that for years tricked the EPA's testing system.

"Today we are putting vehicle manufacturers on notice" that there will be additional testing to look for defeat devices, Christopher Grundler, director of EPA's Office of Transportation & Air Quality, said on a call with reporters Friday. "We aren't going to tell them what these tests are, they don't need to know. They only need to know we will be keeping their cars a little bit longer, and driving them a little bit more."

EPA maintains that it has the necessary expertise and equipment to detect defeat devices. However, the regulator did not catch Volkswagen's alleged fraud on the U.S. portion of the 11 million cars globally that contained the defeat device. The cars range from model years 2009 to 2015. According to EPA, the cars 'knew' when they were being tested for emissions, and were able to temporarily present much lower emissions than they did while on the road.

"As you know, the company, very deeply, within 100 million lines of software code, had a very specific algorithm to defeat the test," Grundler said. "They developed a very sophisticated scheme to defeat the test. It was a deliberate attempt to have two calibrations on the vehicle."

Each VW car was able to emit up to 40 times the allowed amount of NOx. EPA still has not calculated the additional amount of NOx the cars contributed to the atmosphere, but Janet McCabe, EPA's acting assistant director, said the agency "need[s] to address this." One

estimate puts the number at between 250,000 to 1 million extra metric tons of NOx pollution per year, according to The Guardian.

NOx emissions have been found to contribute to respiratory illness and heart disease as well as early death.

Buzzfeed News:

Volkswagen Deception Spurs EPA To Start "Defeat Device" Tests Of All Cars
The Environmental Protection Agency will start auditing all cars for "defeat devices" designed to cheat on emissions tests. The decision was spurred by Volkswagen diesel cars violating clean air laws in this fashion.
Dan Vergano

The U.S. Environmental Protection Agency told all major auto companies on Friday that it would now audit cars for emissions test "defeat devices," following revelations that Volkswagen diesel cars cheated on pollution standards.

The environmental agency announced last week that software in Volkswagen diesel cars – perhaps 11 million vehicles worldwide – was designed to turn off exhaust cleaning controls in engines except when the vehicle underwent emissions tests. With the controls off, the vehicle's exhaust contained up to 40 times more pollutants than allowed by law.

"Today we are putting vehicle makers on notice," EPA's Christopher Grundler said during a news conference. Unlike past emissions test, the details of how the agency, along with Canada's environmental agency, will test vehicles for emissions cheating would not be provided to car makers, he said. That will prevent them from writing software allowing cars to recognize when they are being tested and turn on emissions controls.

In the past, the agency had focused on heavy diesel trucks for such tests because of their significant emissions and history of defeat devices, Grundler said. But now all cars will face added inspection for emissions cheating.

Volkswagen's chief, Martin Winterkorn, resigned in light of the revelations on Wednesday. And claims that BMW cars might have similar emissions questions affected the company's stock on Thursday, leading to a 9.7% drop.

The nonprofit International Council on Clean Transportation (ICCT), which had helped alert EPA to the Volkswagen emissions cheating, said in a statement last week that "defeat devices" are a worldwide problem in cars. European studies, "repeatedly found large and growing gaps between real world emissions and the regulatory certification levels."

"This is a global problem that will require a coordinated global solution," said ICCT's Drew

Kodjak.

E.P.A. to Bolster Testing Because of Volkswagen Scandal
By THE NEW YORK TIMES SEPT. 25, 2015

Government regulators said Friday that they planned to step up the testing requirements of cars in the wake of the Volkswagen scandal.

The Environmental Protection Agency, which disclosed last week that it had learned that Volkswagen diesel cars had equipment to evade smog-testing standards, said it had sent a letter to manufacturers of gasoline and diesel cars saying that regulators would be looking for so-called defeat devices in all vehicles.

The agency said Volkswagen had used a device programmed to fool emissions testers into thinking that the car was emitting much less pollution than it was during regular driving.

"Manufacturers should expect that this additional testing may add time to the confirmatory test process," the E.P.A. wrote in its brief letter. The agency said that the new procedures would start immediately and that the California Environmental Protection Agency and Canada's environmental regulators were involved with the stricter requirements.

"We are not going to tell them what these tests are, and they don't need to know," Chris Grundler, director of the agency's office of transportation and air quality, said during a conference call with reporters.

U.S. EPA Toughens Emissions Oversight After VW Cheating
Jeff Plungis
September 25, 2015 — 8:42 AM EDT Updated on September 25, 2015 — 10:41 AM EDT

U.S. environmental regulators will add more spot-checks to cars already on the road

following Volkswagen AG's admission that it fitted as many as 11 million diesel cars worldwide with software that rigged pollution tests.
"We are upping our game," said Christopher Grundler, director of the Environmental Protection Agency's Office of Transportation and Air Quality.

The U.S. Justice Department is conducting a criminal investigation of Volkswagen, and the company said it's cooperating with regulators. The admission has marred the reputation of the world's largest automaker and sent its shares to the lowest levels in years. Volkswagen's board is expected to name a successor Friday to former Chief Executive Officer Martin Winterkorn, who resigned this week.
The EPA is sending a letter Friday to automakers informing them that emissions monitoring is being enhanced. Grundler wouldn't say what changes the agency will make to the testing.

"They don't need to know," Grundler, speaking to reporters on a conference call, said of the automakers. "They need to know that we will be keeping their cars a little bit longer."
Grundler earlier told the Associated Press that the agency may add on-road testing. It already has on-road testing ability but it's only been used to check carmaker gas mileage estimates and diesel trucks, two situations in which they had uncovered emissions cheating in the past.

Past Cheating
The scandal now engulfing VW, which has admitted to outfitting cars with software designed to give false readings on emission tests, is unique both for the number of vehicles involved, and the digital complexity. But it's not the first emissions-cheating case, even for the Wolfsburg, Germany-based company.

In 1973, the EPA accused the automaker of installing defeat devices in cars it wanted to sell in the 1974 model year. VW then admitted it had sold 1973 model year cars with the devices, which consisted of temperature-sensing switches that cut out pollution controls at low temperatures.
General Motors Co. agreed in 1995 to pay $45 million after being accused of circumventing pollution controls on 470,000 Cadillac luxury sedans. The cars' 4.9-liter V-8 engines were tuned to turn off pollution controls when the air conditioning ran, the EPA said at the time.

The current VW case resembles a 1998 case involving seven manufacturers of heavy-duty truck engines: Caterpillar Inc., Cummins Inc., Detroit Diesel Corp., Mack Trucks Inc., Navistar International Transportation Corp., Renault Vehicules Industriels, S.A. and Volvo Truck Corp.
The companies agreed to spend more than $1 billion, including $83.4 million in penalties, to settle the case -- the biggest civil fine to that point for violating an environmental law.

EPA steps up emissions testing after Volkswagen scandal
By Timothy Cama - 09/25/15 11:22 AM EDT
The Environmental Protection Agency (EPA) is stepping up its emissions testing for diesel cars in an attempt to root out companies that cheat the tests.

The agency, working with officials in California's air pollution agency and Canada, plans to test every model of diesel car on the road to see if other automakers programmed their cars to skirt the tests like Volkswagen Group did.

"We're putting vehicle manufacturers on notice that our testing is now going to include additional evaluation and tests designed to look for potential defeat devices," Chris Grundler, director of the EPA's transportation office, told reporters Friday.
"We aren't going to tell them what these tests are. They don't need to know," he said.
"They only need to know we will be keeping their vehicles a little bit longer and we're going to be driving them a little bit more."

The new procedure comes a week after the EPA announced that Volkswagen had programmed many of its diesel cars sold since 2009 to figure out when they were undergoing EPA tests and change their pollution output to comply with the tests.

In real-world driving, the cars emit up to 40 times more nitrogen oxides than allowed under the Clean Air Act.

Officials with the different agencies hope that their tests can find any emissions problems that were not revealed in the testing that all new cars undergo, which is very standardized and does not usually involve on-road driving.

"We must continue to improve and adapt our oversight, and we will," said Janet McCabe, acting head of the EPA's air pollution office.

The emissions issue, to which Volkswagen has admitted, has quickly evolved into an international scandal, with government officials in Europe, Germany, the United Kingdom, France and elsewhere taking action.

Domestically, the Justice Department is conducting a criminal investigation, and a House committee will soon hold a hearing on the scandal.

Volkswagen's chief executive officer resigned this week, and the head of its United States operations is expected to resign as well.

The EPA initially identified less than 500,000 cars with Volkswagen and Audi branding affected. But the company later said the problem extended to 11 million cars worldwide, although the issue only applies to United States emissions standards.

The EPA has 23 devices for testing on-road driving emissions, but Grundler said those have usually been dedicated to heavy-duty truck use.

Grundler and McCabe repeatedly declined to outline the new test procedures, saying they do not want automakers to try to defeat them.

"The smart engineers at EPA, California Air Resources Board and Environment Canada have come up with clever ways to do this," Grundler said.

The announcement does not change the standard testing that applies to new vehicles. Instead, the EPA is using its authority to test cars currently in operation, including those from rental car fleets and individual consumers.

The new tests started Friday, Grundler said, declining to say how long it would take to test all diesel car models.

EPA to change diesel tests to thwart Volkswagen-like cheating
By Tom Krisher and Matthew Daly - Associated Press - Friday, September 25, 2015

DETROIT (AP) — The U.S. Environmental Protection Agency plans sweeping changes to the way it tests for diesel emissions after getting duped by clandestine software in Volkswagen cars for seven years.

Chris Grundler, head of the EPA's office of transportation and air quality, indicated the agency would add on-road testing to its regimen. VW's sophisticated software allowed its cars to pass tests in the lab and then spew pollution into the atmosphere while on the highway.

The revelations meant unwanted scrutiny for the EPA. Its testing procedures have been criticized for being predictable and outdated, making it relatively easy for VW to cheat. What's more, the EPA did not initially uncover the problem; researchers at West Virginia University did, using on-road testing.

Grundler says the changes are designed to detect software and other methods automakers might use to rig a test.

The EPA and the California Air Resources Board have engineers who are "developing clever ways in which these things can be detected," Grundler says.

He also notes that testing of diesel engines, which make up only 1 percent of the vehicles on U.S. roads, wasn't the top priority for the EPA. The agency did have on-road testing equipment — but it was assigned to monitor automaker gas mileage estimates and heavy-duty diesel trucks, where cheating had been uncovered in the past.

Grundler, who has been with the EPA for more than three decades, says the lack of on-road testing for diesels "might change in the future." An announcement of the changes could come on Friday.

VW has admitted to installing software on Volkswagen and Audi cars with four-cylinder diesel engines that switches on pollution controls when they are being tested. When the software, called a "defeat device," determines that the cars are back on real roads, the controls are turned off. The EPA says about 500,000 U.S. cars including the Jetta, Golf, Beetle, Passat and Audi A3 have the cheating software, and VW says a total of 11 million cars have it worldwide.

VW was able to fool the EPA because the agency only tested the cars on treadmill-like devices called dynamometers and didn't use portable test equipment on real roads. The software in the cars' engine-control computers checked the speed, steering wheel position, air pressure and other factors to determine when dynamometer tests were under way. It then turned on pollution controls that reduced the output of nitrogen oxide, an ingredient in harmful ozone, the EPA has said.

VW started the scheme with the 2009 model year, and may not have been caught without testing performed at West Virginia University on behalf of the International Council on Clean Transportation, a nonprofit group that advises governments on regulations. EPA and California regulators confronted VW with those findings to VW in May 2014. The automaker eventually did a recall late last year, without much improvement, the EPA says.

Only when the EPA and CARB refused to approve VW's 2016 diesel models for sale did the company admit what it had done.

The EPA announced the violations a week ago and said VW could face billions in fines. The agency said the cars are safe to drive but VW will have to pay to recall and fix them. The agency also is going to test diesels from other manufacturers to make sure they don't have similar devices.

Sen. Bill Nelson of Florida is frustrated that regulatory agencies such as the EPA are failing to protect the public. "Seven years is way too long a time that the EPA has been asleep at the switch," he says.

He says the VW case has similarities to those involving General Motors ' defective ignition switches and Takata Corp.'s exploding air bag inflators, where it also took years before

those problems were disclosed to consumers.

"When there is this kind of deception, we've got to get these agencies to be able to cut through it and catch it," Nelson says.
It's not the first time the EPA has had to change testing to make sure automakers are playing by the rules. Earlier this year the agency updated gas mileage tests after some automakers were caught with inflated window sticker estimates.

Grundler disputes the notion that EPA would never have caught VW without the outside help. European regulators were looking into VW's on-road diesel emissions as far back as 2012, and since diesels make up half the cars there, the EPA decided to let Europe take the lead, he says.

"I don't think it's fair to say that this would never have been uncovered," he says. "Do I wish we had uncovered it sooner? Absolutely."

EPA to road-test cars after Volkswagen emissions scandal
Nathan Bomey, USA TODAY 10:40 a.m. EDT September 25, 2015
The change comes after Volkswagen fooled regulators into believing that its 4-cylinder diesel cars were compliant with emissions rules.

The Environmental Protection Agency told automakers on Friday that it will begin road tests of all new and used vehicle models to examine emissions claims following the exposure of Volkswagen's regulation cheating scandal.

The agency sent a letter to manufacturers notifying them that it will no longer rely exclusively on laboratory testing to validate emissions performance.

EPA also plans to begin testing all diesel models already on the road in the U.S. to check for similar violations.

"EPA may test or require testing on any vehicle at a designated location, using driving cycles and conditions that may reasonably be expected to be encountered in normal operation and use, for the purposes of investigating a potential defeat device," EPA told automakers in the letter.

The agency warned that the new process could mean it will take longer for automakers to secure certification required to sell new vehicles in the U.S.

"We aren't going to tell them what these tests are," said Christopher Grundler, director of the EPA Office of Transportation and Air Quality, in a conference call with reporters.

"They don't need to know."

The change comes after Volkswagen fooled regulators into believing that its 4-cylinder diesel cars were compliant with emissions rules by installing sophisticated software to manipulate lab tests.

In reality, 11 million Volkswagen cars worldwide are emitting nitrogen oxides — which can exacerbate respiratory conditions such as asthma — at rates of up to 40 times acceptable U.S. standards.

The scandal has severely damaged Volkswagen's reputation, led to the resignation of the automaker's CEO and called into question the future of diesel cars. Several criminal investigations and numerous lawsuits have also followed.

The automaker set aside more than $7 billion to pay for fixes and fines. The episode is expected to trigger a massive recall.

The Volkswagen scandal has sparked a huge change in car emissions testing
by Benjamin Snyder @WriterSnyder SEPTEMBER 25, 2015, 10:39 AM EDT

Critics have wanted this move for years.

The U.S. Environmental Protection Agency will being testing vehicles' ability to meet emissions standards under real-world driving situations, it announced Friday. The agency formerly conducted random testing of vehicles in a way that critics have argued failed to simulate actual driving.

The change comes less than a week after German automaker Volkswagen admitted that 11 million of its diesel vehicles worldwide were loaded with software designed to trick the emissions testing process. About half a million of those vehicles were sold in the U.S.

EPA may test or require testing on any vehicle at a designated location, using driving cycles and conditions that may reasonably be expected to be encountered in normal operation and use, for the purposes of investigating a potential defeat device," reads a letter the EPA sent to automakers Friday, using an industry term for the illicit software found on Volkswagen's cars.

EPA officials said on a call with reporters Friday that the agency is "actively" testing diesel cars to ensure they meet emissions standards following the Volkswagen's revelations. Environmental agencies in the State of California and Canada are spearheading efforts to ensure there's a "broader and more robust presence" of testing, officials added.

The EPA also said it's working with Volkswagen to determine how to modify the affected vehicles already sold in the American market.

Volkswagen's stock price has tanked amid the scandal, which forced Volkswagen AG CEO Martin Winterkorn to resign Wednesday.

EPA to Overhaul Air-Emissions Testing in Wake of Volkswagen Cheating Revelation
By AMY HARDER
Sept. 25, 2015 9:31 a.m. ET

WASHINGTON—The U.S. Environmental Protection Agency is overhauling the way it polices auto-maker compliance with air-emissions standards after Volkswagen cheated on its testing for seven years, an agency official said Friday.

The EPA is sending a letter to auto manufacturers to explain that it may test or require testing of vehicles in an environment that would resemble normal driving conditions, the official said.

The EPA's current protocol doesn't test under real-word driving conditions, and requires auto makers instead to submit design certificates for compliance. The EPA has conducted random testing, but those are done in a controlled environment. Volkswagen had installed software designed to evade those tests.

Since at least 2008, Volkswagen has been using software, dubbed defeat devices, in several light-duty diesel models around the world—nearly a half-million cars in the U.S. and as many as 11 million world-wide—that disabled air-emissions controls under normal driving conditions.

The EPA's announcement Friday caps a tumultuous week for Volkswagen, whose CEO resigned following the revelations, and for the U.S. government, which scrambled to respond to the German auto maker's cheating.

The Justice Department is pursuing a criminal investigation.

"We have to be concerned about whether or not there are other defeat devices out there that

we have not been able to detect," EPA Administrator Gina McCarthy said at an event hosted by The Wall Street Journal this week. "This was particularly difficult for us to detect. We got there."

It wasn't immediately clear Friday how comprehensive the new testing in normal driving conditions would be. Some experts have been calling on the agency to conduct such testing.

"The most important change that could take place is if EPA started incorporating real-world testing throughout their compliance process," said Drew Kodjak, executive director of the International Council on Clean Transportation, a nonprofit research organization. The organization, alongside West Virginia University researchers, uncovered the testing anomalies in two Volkswagen model cars in 2014.

"The agency certainly has the authority to do this type of thing, but typically doesn't do them because, frankly, they're quite expensive," Mr. Kodjak said on Thursday.

In 2014, Mr. Kodjak's group and the university researchers conducted emissions testing, including under normal-driving conditions, that found two Volkswagen cars—a 2012 Jetta and 2013 Passat—had significantly higher nitrogen oxide emissions during normal driving conditions than what was certified with the EPA. Another car the researchers tested, a diesel-powered BMW, didn't have higher nitrogen oxide emissions.

EPA to change diesel tests to prevent VW-like cheating
by Chris Matthews @crobmatthews SEPTEMBER 25, 2015, 7:50 AM EDT

Diesel 'wasn't the top priority for the EPA.'

The U.S. Environmental Protection Agency is planning wholesale reform of its procedure for testing diesel engines, following revelations that Volkswagen VLKPY -5.72% installed software in its cars that allowed it to fool regulators into thinking the vehicles were cleaner than they actually were, according to the Associated Press.

Chris Grundler, head of the EPA's office of transportation and air quality, told the news service that his agency would begin testing cars on the road in addition to the tests performed with cars on treadmills.

Grundler told the AP that cars with diesel engines, which make up only 1% of the vehicles on U.S. roads, "wasn't the top priority for the EPA."

"The agency did have on-road testing equipment — but it was assigned to monitor automaker gas mileage estimates and heavy-duty diesel trucks, where cheating had been uncovered in the past," the report said.

The EPA's testing procedures have been criticized for being predictable and outdated, the AP said, potentially making it easier forVW to cheat. And it was researchers at West Virginia University—not the EPA—that uncovered the problem using on-road testing, the AP added. An announcement of the changes could come on Friday.

Financial Times:
http://www.ft.com/intl/cms/s/0/d4feb2e2-628e-11e5-9846-de406ccb37f2.html#axzz3mgG3bZd2

Volkswagen board gathers to appoint replacement for Winterkorn
Chris Bryant in Frankfurt and Barney Jopson in Washington

Volkswagen's board are gathering to appoint a new chief executive to lead the troubled carmaker out of the worst scandal in its history, with Matthias Müller, head of Porsche, as the favourite candidate.
The supervisory board meeting at VW's Wolfsburg headquarters — which may take several hours — follows Martin Winterkorn's resignation after eight years at the helm of the group.

People close to VW indicated that Mr Müller is the frontrunner in the succession race.
He is close to the Porsche and Piech families, who together control a majority of VW's voting shares, knows Volkswagen inside out and has a reputation for speaking his mind.
The company declined to comment.

The board is also expected to decide on Friday which managers must leave the company over the scandal, with attention focusing on high-level engineers and designers.

VW has been reeling since the US Environmental Protection Agency revealed last Friday that the group had rigged its diesel cars to pass emissions tests, potentially laying itself open to criminal charges and substantial fines.

The EPA said that VW had installed "defeat device" software that activated technology designed to reduce emissions from the vehicles only when it detected that they were being tested. The emissions then returned to much higher levels during regular driving.

The EPA said 482,000 vehicles sold in the US since 2008 were affected, but VW later raised that figure to 11m worldwide. It said it would take a €6.5bn charge to cover the costs of the crisis.

A senior official at the EPA told the Financial Times that Volkswagen had orchestrated an unprecedented effort to beat the EPA's rigorous testing regime. "The level of deceit the company went through to game the system was enormous," the official said.

The EPA operated a cutting-edge testing regime to police compliance with clean air regulations, the official said, and it took an "elaborate, aggressive, ongoing, co-ordinated

effort" to beat it. "We've seen uses of defeat devices, but nothing to this scale," the official said.

INSIGHT-After year of stonewalling, VW stunned US regulators with confession
WASHINGTON/DETROIT SEPT 24 | BY TIMOTHY GARDNER, PAUL LIENERT AND DAVID MORGAN

The confession of cheating that's embroiled Volkswagen AG in one of the biggest scandals in auto industry history came on a cool California morning, on the sidelines of an academic conference focused on green transportation.

After more than a year of stonewalling investigators, Volkswagen stunned two senior officials with the U.S. Environmental Protective Agency and California's environmental watchdog by admitting the automaker hacked its own cars to deceive U.S. regulators about how much their diesel engines pollute.

That disclosure on Aug. 21, confirmed by two people with knowledge of the exchange, shows Volkswagen buckled to pressure from environmental regulators almost a month earlier than the scandal was made public. The admission to regulators came after a year during which VW officials insisted to regulators that tests on its diesel cars showing a spike in pollution levels on the road were in error.

U.S. officials exposed the deception on Sept. 18, triggering Volkswagen's admission that it had installed software in its cars to detect when they were being tested and alter settings to conceal the true emissions of 11 million cars sold worldwide. The delay between VW's confession and the U.S. exposure of the scandal occurred as regulators prepared their response to the disclosure.

As a result, Volkswagen, the world's largest automaker by sales, faces EPA fines that could reach $18 billion, class action and other lawsuits that could add billions of dollars more in liability and a U.S. criminal investigation. VW's leadership is in turmoil after chairman Martin Winterkorn was forced to resign and sources said other executives including the head of U.S operations were soon to follow.

Now, the story of how investigators unraveled systemic cheating in the face of consistent denials from the company may have implications for the sanctions VW will face and for an auto industry certain to face more scrutiny about its environmental claims. The company's lack of cooperation could figure into punitive action by the government.

At first, regulators were surprised that Volkswagen would make its confession at the conference, held in Pacific Grove, California. Minutes before Christopher Grundler, director of the EPA's transportation and air quality office, was to deliver a 9 a.m. speech to the conference, a Volkswagen representative told him about the deception. At the same meeting, representatives of the California Air Resources Board, a state agency that had been pushing VW hard, were also given a verbal notice of the deception, people with knowledge of the events said.

Volkswagen declined to comment on the sequence of events described to Reuters. It isn't clear who the VW representative was who delivered the news of the deception to Grundler and the CARB. Stuart Johnson, head of VW's engineering and environmental office in the United States, was registered to attend the Aug. 21 conference, which was organized by the University of California, Davis. Johnson, who still works for VW in Auburn Hills, Michigan, did not respond immediately to a request for comment.

Norbert Krause, who was head of VW's U.S. environmental office until 2009 and who retired from VW in 2011, said nobody at Volkswagen of America was involved in the process of engineering the diesel cars.

"I don't know anything about the modification of the software," Krause said when reached by telephone in Germany. "The software was okay when we certified the vehicle and we made our durability runs. Everything was fine."

DECEPTION ACKNOWLEDGED

A formal acknowledgement of the deception came on Sept. 3, when the EPA and California officials held a conference call with Volkswagen executives in Germany and the U.S. During the call, the automaker went over written details provided to the participants explaining how software used in its diesel cars was able to manipulate emissions tests in the United States.

That admission came after the EPA threatened to withhold approval for the company's 2016 Volkswagen and Audi diesel models, according to a letter sent by the EPA to Johnson and VW's attorney. The letter detailed some of the timetable of the EPA's actions.

So ended 15 months of back-and-forth between Volkswagen and U.S. and California regulators who had come to suspect that the diesel engines were producing higher nitrogen oxide emissions during normal driving conditions than what was certified by the EPA and California, people involved said. Nitrogen oxide emissions have been linked to smog and acid rain.

Volkswagen had heavily marketed what it called "clean diesel" engines starting in 2008 with the 2009-model Jetta TDI. It appeared to have found a sweet spot between high-performance and fuel-efficiency with a zippy, fun-to-drive car that topped 40 miles per gallon in highway driving. Named "Green Car of the Year" at the Los Angeles auto show in 2008, the Jetta TDI was seen as a breakthrough in a country where diesel passenger cars occupy a tiny niche compared with Europe, where they are about half of the market.

GRANDFATHER'S DIESEL

"It's not your grandfather's diesel," Krause said in a September 2008 presentation to U.S. regulators, according to a video of the remarks.

Krause and other VW officials promised a diesel that would meet pollution laws in all states, including California where diesel engines had long been associated with smog and cancer-causing soot.

By that point, VW and other automakers had lobbied for almost a decade for regulators to give diesel another chance. In 2000, VW and other companies with an interest in promoting diesel, including Mazda, formed the Diesel Technology Forum to lobby for increased use in the United States as a way to reduce reliance on imported oil. In 2005, an energy bill signed by President George W. Bush offered tax credits for diesel buyers. That gave the first wave of diesel Jetta buyers an income tax credit of $1,300 each.

In 2009, after the new Jetta went on sale, VW dealers initially sold out, including in California where regulations had effectively shut the market to diesels earlier in the decade.

Around the same time, in Europe, regulators were skeptical. A European Commission study concluded in 2013 that European car makers were exploiting test loopholes. Separate findings by the EC's Joint Research Centre showed a discrepancy between test results and real world performance in European diesel engines.

California began its inquiry after EC regulators sought to obtain American data on the on-road emissions performance of diesel engines, said Stanley Young, CARB's communications director. The Europeans had a working theory that diesels should run more cleanly in the United States, where regulations are stricter, than in Europe.

To produce that data, they commissioned the U.S.-based nonprofit International Council on Clean Transportation in February 2013, which hired researchers at a West Virginia University lab.

The WVU researchers placed emission-monitoring equipment on a rented 2012 Jetta and a 2013 Passat. Over seven weeks in spring 2013, they drove the cars around Los Angeles and up the West Coast to Seattle, comparing them to a BMW X5 sport-utility with a diesel engine, said Daniel Carder, who led the WVU team. While the BMW's emission results came in under what the vehicles produced in laboratory tests, those of the Jetta were 15 to 35 times higher than the legal limit and the Passat 10 to 20 times higher.

Soon after, the same rental cars tested by WVU were monitored in CARB's El Monte, California, test facility east of Los Angeles. There were no irregular emissions.

Over the next 12 months, the West Virginia University researchers analyzed the data. They presented their findings at a March 31, 2014, conference in San Diego partly sponsored by California regulators and the EPA.

EXECUTIVES ON ALERT

"That data put our executives on alert that there was clearly a problem for the U.S. and California," said Young, the CARB official.

At meetings between California officials and Volkswagen that began in the summer of 2014, engineers from the German carmaker tried to "discredit the findings" by challenging the data and methodology of the study, Young said. "They were recalcitrant," he said. "It was a range of issues. Every time it was something different."

Among other things, VW said that "our calibration was off" and that the discrepancies had to do with "the conditions under which the test was done," Young said.

On Dec. 2, Volkswagen shared the results of its own tests, blaming its increased emissions on "various technical issues and unexpected in-use conditions," according to the EPA. Then Volkswagen agreed to recall vehicles to fix their engine-control software.

Engineers at CARB kept testing and found the proposed software fix did not significantly reduce emissions. A break came when they looked at diagnostic data stored in the cars' own computer system.

"We discovered some very strange anomalies," Young said. "For instance, the car was running more cleanly when it was cold than when it was warm, which is the opposite of what every other car does - because once you warm a car up that's when it begins to deliver its best pollution controls. This was not the case. So clearly something else was going on. Over time we assembled enough proof and questions that they could no longer provide any reasonable explanation for what was going on."

On July 8, CARB shared its results with VW, but there was no change in Volkswagen's position. Some officials privately questioned whether Volkswagen was deliberately violating the federal Clean Air Act by installing defeat devices -- software programmed to switch engines to a cleaner mode during official emissions testing, according to a person involved in the process.

During normal driving, the software then shuts off, enabling cars to emit as much as 40 times the legal limit of pollutants.

In early August, Oliver Schmidt, who followed Krause and preceded Johnson in VW's U.S.

engineering and environmental office, attended a conference in Traverse City, Michigan and told regulators Volkswagen stood by its conclusions that the problem was technical, said people involved said. Schmidt declined to speak to Reuters.

"I'm just amazed," said Alan Lloyd, who headed CARB from 1999 to 2004 and helped open California's market to diesels. "Why someone would think they could cheat in this way and get away with it is beyond me."

Will Volkswagen Scandal Tarnish 'Made in Germany' Image?
By DAVID RISING, ASSOCIATED PRESS
BERLIN — Sep 24, 2015, 4:54 PM ET

The "Made in Germany" label has stood for precision and reliability for decades, but since Volkswagen admitted to cheating on U.S. car emissions tests, many are questioning whether the automaker's problems could taint the rest of the country.

It's the second serious blow to a major German company's reputation in six months, following the tragic crash of a Germanwings jet that killed 150 people. Parent company Lufthansa has faced questions over why it failed to identify the psychological issues suffered by the pilot who intentionally flew the plane into a French mountain.

Will such crises tarnish the hard-won, valuable reputations for quality of other German brands, such as BMW, Daimler or Bosch?

Experts say VW's problems could hurt the economy in the short term due to the company's sheer size, but that long-term damage to the country is unlikely.

That doesn't mean others won't try to capitalize. Companies will try to grab market share. And across Europe, people in countries that have been lectured by Germany for years about the virtues of financial honesty could be feeling smug.

"Not only does this make Germany look bad, I think that Germany has been very good at moralizing to the rest of Europe about the financial crisis and other things," said Michael Hewson, chief market analyst for CMC Markets in London.

"Germans have a word for it — 'schadenfreude' — and Germany's getting a big dose of it now," he said, referring to the German word for taking pleasure at the misfortune of others.

Indeed, Internet memes of VWs covered in clouds of smog were already making the rounds, and media commentators were quick to pounce on the issue.

"In Europe, there is a strong dose of schadenfreude ... after the Germans, and primarily Chancellor Angela Merkel, have for years been giving lectures others," wrote Thilo Schaefer for Spain's La Marea news magazine.

Still, in Lufthansa's case, the airline has not appeared to suffer any serious damage following the March crash.

Volkswagen's case could prove more costly for the company, though by how much is still unclear. CEO Martin Winterkorn resigned Wednesday and the company is expected to name a replacement Friday.

The EPA accused VW of installing the so-called "defeat device" in 482,000 cars sold in the U.S. VW later acknowledged that similar software exists in 11 million diesel cars worldwide and set aside 6.5 billion euros ($7.3 billion) to cover the costs of the scandal.

It still faces possible criminal investigations and maybe as much as $18 billion in U.S. fines. The final cost could also depend on a host of class action lawsuits being filed by consumers who feel duped.

This is by no means the first time in recent years that a major German company's reputation for probity has taken a huge knock — though perhaps the first time that the damage has stemmed directly from a product that was popular with consumers.

Volkswagen itself was at the center of an unappetizing scandal less than a decade ago — before Winterkorn took over — that resulted in criminal convictions for the company's then-personnel chief and employee council chief, among others. That case centered on allegations that VW's influential employee representatives received illegal privileges, including lavish foreign trips involving prostitutes paid for by the company. The probe started after Volkswagen alerted prosecutors to possible wrongdoing.

Industrial conglomerate Siemens AG acknowledged dubious payments of up to 1.3 billion euros in a bribery case that came to light in 2007 and prompted the departure of the company's then-CEO and board chairman.

The company's biggest bank, Deutsche Bank, has also struggled to put behind it lawsuits and legal issues that in some cases date back years.

In April, Deutsche Bank agreed to pay $2.5 billion to authorities in the U.S. and Britain to settle allegations its traders rigged important market interest-rate benchmarks used to determine rates on a variety of debt.

Hartmut Dziemballa, who conducts image research for Germany's GfK institute with a focus on the automotive and airline sectors, said past scandals have not had lingering effects and that he didn't expect the Volkswagen scandal would significantly affect other German manufacturers — even car companies.

"The quality and the German engineering is still there, and people know that," he said.

Still, if a scandal with any brand has the potential to smear the whole "Made in Germany" label, it's Volkswagen, which is deeply interconnected with the country's people and politics.

Germany is the world's third largest exporter, vehicles are its largest export, and Volkswagen is its largest automaker. It employs over half a million people globally.

It's the largest single employer in its home state of Lower Saxony, which owns 20 percent of the company and whose governor and economy minister sit on its board of directors. VW's former personnel director Peter Hartz was also an adviser of former Chancellor Gerhard Schroeder, and today's welfare system is still called "Hartz IV" after his reforms.

Carsten Brzeski, an analyst with ING in Frankfurt, said while "the reputational damage is currently impossible to assess," because of its size even if the main impact of the scandal is limited to Volkswagen it could have serious economic effects on the German economy overall.

"While the German economy defied Greece, the euro crisis and the Chinese slowdown, it could now be facing the biggest downside risk in a long while," he said in a research note.

Analysts say there is the possibility that the fallout from the scandal might affect other car companies, whether through the need for tougher regulation or a shift away from the diesel engines at the center of the U.S. scandal.

Vice Chancellor Sigmar Gabriel told reporters at the auto show in Frankfurt after the news broke that the VW scandal would mean nothing to the "Made in Germany" label — before adding "I hope."

Dealers, owners frustrated over VW scandal
Associated Press 3:21 p.m. EDT September 24, 2015

LOS ANGELES — Bob Rand bought his Volkswagen Passat last year for its clean emissions and high gas mileage. He liked the car so much he convinced his son and a friend

to buy one, too.

Now, as Volkswagen comes clean about rigging diesel emissions to pass U.S. tests, Rand is desperately trying to sell the fully loaded model with white leather seats for $10,000 below what he paid. His sole bite has been from a man who offered $7,500 on speculation that he could resell it in Mexico.

"Volkswagen was somebody that you could rely on for cutting-edge products and quality and all those things and now you find out that they're not above lying just flat out," said Rand, who plans to join a class-action lawsuit against VW. "That's probably about as bad a thing as a company can do is lie to your face when you're buying a $35,000 car."

Rand's anger at the world's top-selling car company was echoed Wednesday by private dealers, auto wholesalers and owners across the U.S. as fallout from the smog test trickery mounted.

The EPA first disclosed Friday that stealth software makes VW's 2009-2015 model cars powered by 2.0-liter diesel engines run cleaner during emissions tests than in actual driving. On Wednesday, Volkswagen CEO Martin Winterkorn resigned and took responsibility for the "irregularities" found by U.S. inspectors — a scandal that has wiped out billions in the company's market value and raised the possibility of criminal investigations and billions more in fines.

The revelations left dealers sitting on hundreds of diesel cars they could not sell. Many also dealt with a flood of angry calls, emails and tweets from Volkswagen owners who felt betrayed because they believed they had bought a car that polluted less without sacrificing the good gas mileage and performance that comes with a diesel engine.

"I think their feet should be held to the fire. I think apologies don't mean anything when something is so premeditated," said Joe DeCarolis, of Cary, North Carolina, who owns a 2012 TDI Jetta Sport Wagon — a car he bought after careful comparison shopping for its clean emissions and good gas mileage.

Jon Vitale of Fowlerville, Michigan, listed his 2012 Volkswagen Passat for sale on the Internet last month, barely getting any interested callers.

But after finding out about the scandal, he's thinking the news might actually make it easier to sell his car.

"I don't know if the news will help me or hurt me," said Vitale, who bought the car used two years ago for its gas mileage. "I didn't get much interest before the news came out. If someone wants it, maybe they'll pay more because there's a stop sale on the new models."

Dealers can't give customers good answers because Volkswagen hasn't said a whole lot, said AutoNation CEO Mike Jackson, the leader of the largest auto dealership chain in the U.S.

AutoNation's six Volkswagen and eight Audi dealerships in the U.S. are telling customers that the cars are safe to drive and promising to call them as soon as they know more about repairs. "That's not adequate," Jackson said. "We need answers by next week."

A lot of people within VW had to know about the software that turned emissions controls on during government tests and off for regular driving, especially because the scheme went on for multiple years, Jackson said.

"This tells me that it's not a bad apple. It's not a rogue employee. It's deliberate deception," Jackson said. "It's a systemic failure. This took a lot of meetings. This took a lot of engineers. This took a lot of software programmers to put in place and keep in place."

Meanwhile, concern was growing at private dealerships about what to do with inventory that's now gathering dust.

At Volkswagen of Oakland, California, nearly two dozen new diesel cars have no chance of being sold in the short-term, while 25 2016 model vehicles are being held up at the Port of San Diego because they can't pass emissions standards, sales manager Chris Murphy said. Customers have been calling and emailing to demand the dealership buy their cars back or offer refunds.

"We can't afford to buy all those cars back. We're just one dealer," he said, adding that diesel models make up about 30 percent of the business. "This is definitely going to impact our business. We're trying to focus on positive, not negative things because there's nothing we can do."

Williams Volkswagen in Lansing declined to comment on how the company's actions affected its sales. It's the only Volkswagen dealer in the region.

Vitale thinks used models may become more valuable to some people who aren't as environmentally conscious, particularly because Michigan doesn't require emissions testing.

"I got a call a few days ago and the guy asked me about the news, and despite all that, he still wanted it," said Vitale, who is selling the car because he no longer needs it. "It's not illegal to drive in Michigan because there's no emissions testing here."

Volkswagen has taken steps to help out the dealership, Murphy said. That includes guaranteeing reimbursement for sales objectives for two quarters whether or not the goals are met and waiving the interest the local franchise normally pays on unsold cars on their sales floor, he said.

"They're making all the right steps. … I'm just waiting for everything to get uncovered to see how deep this really goes. I'm not mad at anyone except the people higher up who made these decisions," Murphy said.

Lash Volkswagen of White Plains, N.Y., has been scrambling to accommodate affected Volkswagen owners by giving them loaner cars and picking up or dropping off their cars when it's time for repair, said Tom Backer, general manager of the dealership in New York's Westchester County.

Dealers, he said, were told that there will be both software and hardware changes to fix the problem. They're already on 2016 models and are awaiting approval from the Environmental Protection Agency, Backer said. Older models will get the same fixes, he said.

But not every Volkswagen dealer is fielding calls from angry customers.

Bill Haggerty, a sales manager at a VW dealership in the Chicago suburb of Oak Lawn, Illinois, said he hasn't heard concerns from customers so far. Diesels make up less than 20 percent of his business and draw the most interest from customers looking for better gas mileage, he said.

"We have 200 Volkswagens in stock; three of them are Jetta diesels," he said. "So, it's not like every Volkswagen out there has got a diesel motor in it. They sell an awful lot of cars with good gas mileage and great safety records."

Volkswagen Diesel Scandal: Is The EPA Partly To Blame?
By Cole Stangler @colestangler c.stangler@ibtimes.com<mailto:c.stangler@ibtimes.com>
on September 24 2015 2:10 PM EDT

Are emissions tests too easy? A Volkswagen car is pictured at a technical and testing center in Zenica, Bosnia and Herzegovina, Sept. 23, 2015. Reuters/Dado Ruvic
Since Volkswagen admitted this week to cheating on pollution tests for years, there has been a flood of outrage. Overwhelmingly, it is directed at the most obvious culprit: the German automaker, which admitted to equipping 11 million of its diesel cars worldwide with software specifically designed to reduce emissions during tests. But some critics argue Volkswagen is not the only one to blame. Are the regulators at fault, too?

"Automakers have been able to exploit lax testing systems in the U.S. and Europe," declared a Bloomberg editorial this week. "Regulators owe it to both car buyers and the environment to make these systems more rigorous."

In the United States, critics say, the Environmental Protection Agency isn't as strong a watchdog as it should be. The editorial board at Bloomberg says the EPA gives automakers like Volkswagen too much latitude in determining testing conditions. The agency doesn't have engineers on hand at the labs that actually conduct the exams, doesn't vary its testing

routines enough and should have done more to detect the sneaky software gambit that will likely lead to the recall of some 500,000 cars in the U.S.

The EPA did not respond to requests for comment.

Volkswagen's deception may be particularly widespread and therefore more egregious. But it's not the first company to cheat American emissions standards. Hyundai and Kia acknowledged they overstated fuel economy standards on 1.2 million cars from 2010 to 2012. Last November, the companies agreed to a combined $300 million settlement with the Justice Department and the EPA for doing so.

Still, Tyson Slocum, director of the energy program at consumer advocacy group Public Citizen, said it's unfair "to claim the EPA is responsible for a very sophisticated deception."

Emissions tests in the United States consist of the following: Automakers put their cars on rollers at various testing sites and run them through a set of federally approved maneuvers. Volkswagen duped the system by writing code into its diesel cars' software that automatically switched them into a sort of "low-emissions mode" during these moves.

Even with a beefed-up team of monitors on hand at testing sites, Slocum said, Volkswagen's trick "would have been very hard to catch." "Stopping a determined criminal is tough," he said, and "at the end of the day, you've got to hold the primary entity accountable."

At the same time, Slocum said, those complaining about the agency's oversight methods or regulatory capabilities should turn to federal legislators.

"Congress is to blame for the EPA's light touch," he said. He scoffed at the "Chicken Little" attacks from federal lawmakers and industry alike that frequently deride the agency as a jobs killer. Since 2010, the agency has seen its budget decline by 20 percent, or about $2 billion. (Earlier this month, before the emissions scandal broke, 20 members of Congress filed articles of impeachment against Gina McCarthy, head of the EPA.)

Europe's testing system, on the other hand, is widely seen as more hands-off than the United States'. Automakers there comply with the New European Driving Cycle, a test that got its last major revision in the 1990s. It takes less time to complete than its American counterpart and doesn't properly simulate real-world conditions, critics contend, and therefore is easier to game. A recent report from the U.K. Committee on Climate Change found the gap between official and real-world emissions of new passenger cars rose from 10 to 35 percent between 2002 and 2014.

Officials from the European Environment Agency did not respond to requests for comment.

Bill Becker is the executive director of the National Association of Clean Air Agencies, a group that represents state and local pollution control agencies. He said "the EPA certainly has a role but they don't deserve a severe whipping about what happened."

Those concerned with preventing similar conspiracies in the future should look toward the judicial system, which has the ability to set a strong deterrent effect, he said. Penalties wield far more influence over automaker behavior than any changes to emissions testing procedures.

"The solution here is for the courts and the Justice Department to impose as severe a penalty as possible," he said, "to penalize so harshly that no other employer would ever consider this again."

Germany: VW cars with suspect software in Europe too
By Geir Moulson | AP September 24 at 12:19 PM

BERLIN — The software at the center of Volkswagen's emissions scandal in the U.S. was built into the automaker's cars in Europe as well, Germany said Thursday, though it isn't yet clear if it helped cheat tests as it did in the U.S.

A day after longtime CEO Martin Winterkorn resigned over the scandal, a member of Volkswagen's supervisory board said he expects more executives to step down. The company's supervisory board meets Friday and could announce new resignations then as well as a new CEO.

The U.S. Environmental Protection Agency disclosed Friday that stealth software makes VW's 2009-2015 model cars powered by 2.0-liter diesel engines run cleaner during emissions tests than in actual driving.

The EPA accused VW of installing the so-called "defeat device" in 482,000 cars sold in the United States. VW later acknowledged that similar software exists in 11 million diesel cars worldwide and set aside 6.5 billion euros ($7.2 billion) to cover the costs of the scandal.

The company has told officials that the vehicles in question included VW cars with 1.6-liter and 2-liter diesel engines in Europe, German Transport Minister Alexander Dobrindt said Thursday.

"We don't yet have figures for how many of these 11 million cars that are apparently affected are in Europe," Dobrindt said. "That will be cleared up in the next few days."

Authorities will continue working with Volkswagen to determine what cars exactly are involved.

It isn't yet clear to what extent the scandal affects other brands in the Volkswagen Group, which has 12 brands in all — including Seat, Audi, Skoda and Porsche. It was also not clear whether the software would have led to VW cheating on emissions tests outside the U.S. as well.

Dobrindt this week set up a commission of inquiry to look into the scandal. The motor transport authority is conducting static and road tests on Volkswagen models and spot tests on cars made by other manufacturers, German and foreign.

In neighboring France, Environment Minister Segolene Royal on Thursday announced random tests of about 100 French cars to ensure that their engines meet pollution standards in the wake of Volkswagen's emissions scandal.

And the European Union's executive Commission called on national authorities "to look into the implications for vehicles sold in Europe and ensure that EU pollutant emission standards are scrupulously respected."

Olaf Lies, economy and transport minister of VW's home state Lower Saxony, which holds a 20 percent stake in the company, said the investigation into the scandal was only just starting.

"There must be people responsible for allowing the manipulation of emission levels to happen," he told rbb-Inforadio.

Winterkorn said Wednesday he took responsibility for the "irregularities" found by U.S. inspectors in VW's diesel engines, but insisted he had personally done nothing wrong.

VW is filing a criminal complaint with German prosecutors, seeking to identify those responsible for any illegal actions in connection with the scandal.

Other auto companies have seen their shares drop, too, though there have been no allegations they cheated emissions tests.

On Thursday, shares in BMW dropped 5.2 percent to close at 75.68 euros after Germany's Auto Bild magazine reported that road tests by the International Council on Clean Transportation showed the BMW X3 xdrive model exceeding European emissions limits by more than 11 times. It did not say what the cause for the alleged problem was.

BMW said in a statement that it was not familiar with the test and would ask the ICCT for clarification. It said that "the BMW Group does not manipulate or rig any emissions tests."

Exclusive - VW recall letters in April warned of an emissions glitch
SAN FRANCISCO | BY ALEXANDRIA SAGE

In April of 2015, Volkswagen of America, Inc.(VOWG_p.DE) sent letters to California owners of diesel-powered Audis and Volkswagens informing them of an "emissions service action" affecting the vehicles.

Owners were told they would need to take their cars to a dealer for new software to ensure tailpipe emissions were "optimised and operating efficiently."

The company didn't explain that it was taking the action in hopes of satisfying government regulators, who were growing increasingly sceptical about the reason for discrepancies between laboratory emissions test results and real world pollution from Volkswagen's diesel cars.

Officials at the California Air Resources Board and the EPA agreed in December of 2014 to allow a voluntary recall of the company's diesel cars to fix what Volkswagen insisted was a technical – and easily solved - glitch. The recall was rolled out nationally over a period of months.

On Wednesday, California Air Resources Board spokesman Dave Clegern confirmed that the letters were part of that recall. "This is one of the fixes they presented to us as a potential solution. It didn't work," he said.

Volkswagen, which had no obligation at the time it initiated the recall to disclose the discussions that had led to it, declined to comment on the letter.

The controversy came to public attention last week after Volkswagen acknowledged it had deliberately deceived officials about how much its diesel cars polluted.

The recall letter instructed owners of certain 2010-2014 Volkswagen vehicles with 2-liter diesel engines to contact dealers for a software update in order to fix an issue with the malfunction indicator light illuminating.

"If the [light] illuminates for any reason, your vehicle will not pass an IM emissions inspection in some regions," the letter warned, noting that California required the update before it would renew vehicle registrations.

"The vehicle's engine management software has been improved to assure your vehicle's tailpipe emissions are optimised and operating efficiently," read the letter, which said an

earlier software update increased the likelihood of the light illuminating.

It is customary for carmakers to perform updates to their cars through dealerships to fix or update software.

Volkswagen has said that 11 million of its cars around the world could be affected in the scandal that broke last week. The German company has set aside 6.5 billion euros ($7.3 billion) in its third-quarter accounts to help cover the costs of any fallout.

The U.S. Justice Department has launched a criminal probe and at least 25 proposed class actions on behalf of consumers have already been filed in seven states.

http://www.wsj.com/articles/vws-customers-feel-confusion-remorse-1443051169

VW's Customers Feel Confusion, Remorse
Auto owners worry how emissions scandal will affect vehicles' performance, resale value and compliance with clean-air standards
By CHRISTINA ROGERS in Detroit and ERIC SYLVERS in Milan

Deborah Scott went shopping for a new car in 2010 and came back home with a diesel station wagon made by Volkswagen AG. Fuel efficiency, low emissions and a peppy engine won her heart.

Now, she finds herself suffering from a case of buyer's remorse. "I feel very confused," said the 61-year-old retired nurse practitioner from Chattanooga, Tenn.

Less than a week ago, the Environmental Protection Agency said the German maker of her car lied about its diesel-emissions performance and is demanding a fix on nearly 500,000 affected vehicles on U.S. roads. That leaves owners, such as Ms. Scott, wondering how that will affect performance, resale value and compliance with clean-air standards.

"I feel like I'm eventually not going to have the car that I initially agreed to buy," said Eric Schoenecker, a Minnesota owner of a 2013 diesel Jetta. A recent visit to Craigslist.com indicated resale value on cars like his have fallen 20% since the emissions scandal emerged. The EPA says affected Volkswagens emit nitrogen oxides at up to 40 times the standard.

Volkswagen's emissions headache has gone global, with the auto maker now saying 10.5 million additional vehicles could be affected outside the U.S. On Wednesday, the company's chief executive resigned amid a sharp decline in market value and many investigations initiated in various countries.

Buyers, however, are primarily interested in answers that aren't immediately forthcoming.

"All we've received so far are talking points from VW emphasizing that we tell customers

this is not a safety issue," Mike Jackson, chief executive of No. 1 car dealer chain AutoNation Inc., said. "They tell us they will get back to us on how they will bring cars into compliance."

Volkswagen representatives said the company is investigating the matter and will be in touch with dealers and buyers as soon as possible.

Dealers say traffic in Volkswagen showrooms is drying up in the U.S., deepening the pressure the auto maker has experienced in recent years as market share has fallen. "As this story matures, we expect it to have more of an impact on sales," said one dealer, choosing to remain anonymous.

Volkswagen has 650 dealers in the U.S., and sold 238,000 vehicles through August—a 2.8% decline from the same period in 2014 and far below other major auto makers selling cars in America. About 20% of those deliveries are diesel.

At some point, those dealers will need to employ a fix, according to EPA guidelines. Volkswagen, setting aside $7 billion for the crisis, will have to pay for repairs. Meanwhile, cars are likely to pass emissions standards because they are fitted with a device that enables cheating on emissions tests, the EPA said.

Anna Stefanopoulou, a mechanical-engineering professor and engine expert at the University of Michigan, said a permanent fix could be as simple as downloading new software for the car. Or, Volkswagen could be looking at a cost of $2,000 a vehicle if new hardware needs to be installed.

Fuel economy, rated at more than 40 miles a gallon for some diesel models sold by VW, will take a hit. Consumption could rise 5% to 7% at high speeds or other driving conditions because components needed to clean emissions can dent engine performance.

Some doubt the solution will be simple.

"A software fix in the U.S. seems very unlikely because the emissions are so much higher than is allowed," Paolo Martino, a Frost & Sullivan consultant, said. Any adjustment would probably so radically "change the performance of the cars that consumers would no longer want to own them.

Wired:
http://www.wired.com/2015/09/vw-going-pay-smog-scandal-much/

Eric Niiler

VOLKSWAGEN ISN'T GOING to get away with this. You don't (allegedly!) fake emissions data for a few million cars and just walk away. But what the German automaker's punishment will be, and how much it's going to hurt—those are still open questions.

The final decision will be up to lawyers at the US Environmental Protection Agency and Department of Justice. That latter agency has opened a criminal probe into the company's (alleged!) emissions software tampering shenanigans. But based on precedent and the outlines of what Volkswagen actually seems to have done, we can make a few predictions.

If US officials absolutely throw the book at VW, EPA rules stipulate a maximum fine of $37,000 per affected car. At 482,000 cars on American roads, that comes to $18 billion. But according to attorneys who work on these kind of cases, that number is way too high for what'll actually happen. The biggest fine of this kind to date was $1.2 billion, a criminal penalty that Toyota paid in 2014 for concealing information about faulty ignition switches that triggered sudden accelerations.

But that was for a mechanical breakdown. For a closer analogy we could look back to 1998, when seven truck manufacturers including Caterpillar and Mack together paid $1 billion for installing defeat devices—sounds familiar—in tractor trailer and pickup trucks. A year before, Ford paid a relatively paltry $7.8 million to settle allegations the company violated the Clean Air Act by yes, installing defeat devices—this time in Econoline vans. But the company also paid $2.5 million in emissions offsets and $1 million to study new technology that fought emissions. So it's possible VW might have to pony up for regulatory violations as well as smog offsets for what they actually emitted.

As a matter of process, regulators will want a fine that's big enough to work not only as punishment for VW but as a deterrent to anyone else who might think about trying something similar. It can't just be the cost of doing business. "There aren't a lot of examples of this kind of conduct," said one private attorney who has handled pollution settlements between major companies and the government. "There are a fair number for failure to disclose, or even covering it up. But to actually plan a violation? That's pretty extraordinary. This will be the highest penalty EPA ever assesses."

Yeah, but how high? To figure that out, EPA lawyers have a lot to consider. Specifically, EPA will want to know what kind of economic benefit VW got from rigging emissions controls. The company claimed greater engine power, performance, and gas mileage, and charged more for the engine than a gasoline engine in a comparable vehicle. VW also got a marketing benefit, donning a green mantle by touting its "clean diesel" technology.

On the other hand, EPA regulators will also factor in what VW does to fix the problem. The company said Tuesday it was setting aside more than $7 billion for repairs. EPA might build that consideration into its calculations and lower the fine accordingly.

That's all on the civil, regulatory side. DOJ's criminal probe could lead to prosecutions of the executives in Germany who approved the so-called "defeat device." Like the bumper sticker says, a fine is a tax for doing wrong. Prison time, though? That's a whole other kind of serious.

But if you believe Gilbert and Sullivan and think the punishment should fit the crime, than

what was this (alleged!) crime's actual shape? Yes, VW diesel-powered Jettas, Passats, Golfs, and Beetles (and an Audi) polluted more during real-world driving than their annual smog tests said they would. But how much more? Tests performed by the International Council on Clean Transportation in 2013 revealed that the VW cars emitted anywhere from 5 to 35 times more nitrogen oxide pollution than allowed by law. So with the help of some air pollution experts, let's do a little back-of-the-envelope figuring. Making it easy on ourselves, we'll use a midpoint of a 20X increase in emissions. Assuming 482,000 cars in the United States with, oh, say, a 120,000-mile lifetime of a diesel engine, VW's US fleet produced 46,657 more tons of harmful, smog-forming NOx pollution than anyone knew.

Now, cars in California alone emitted 161,000 tons of NOx in 2011, according to EPA. (California has a lot of cars.) But still—that's a lot more smog than anyone planned for.

How many deaths did Volkswagen's pollution scandal cause?
A back-of-the-envelope estimate.
Updated by Brad Plumer on September 24, 2015, 8:58 a.m. ET @bradplumer
brad@vox.com<mailto:brad@vox.com>

This week, Volkswagen admitted that it had secretly rigged as many as 11 million diesel cars worldwide so that their pollution controls only worked when they were being tested by regulators. The rest of the time, while the cars were actually being driven, they emitted smog-forming nitrogen oxides at 15 to 35 times higher than the US legal limit.

So how much extra pollution is Volkswagen's deception responsible for? And, since we know air pollution is already harmful, how many additional deaths might those extra emissions cause? What follows is a very rough, back-of-the-envelope estimate based on what we know so far. (Spoiler: the premature death numbers range from single digits to hundreds per year. Like I said, rough.)

1) How much extra pollution do Volkswagen's cars cause? By my calculations, Volkswagen's 482,000 deceitful US cars are currently adding between 5,800 to 14,200 additional tons of nitrogen oxide pollution (NOx) to the atmosphere per year, assuming the cars are driven the US average.*

Extrapolating that out to 11 million cars around the world, and assuming the rest of the cars are driven the European average, we get somewhere between 86,800 and 212,500 additional tons of NOx emissions per year.**

Now, there are lots of assumptions and simplifications embedded in those estimates, particularly around how many miles VW's cars are actually driven. But that's ... potentially a large amount of extra NOx pollution. At the high end globally, it's 20 times what a typical coal plant without emission controls puts out in a year.

2) How many deaths might that extra pollution cause? We know NOx pollution is harmful — current emissions from all the world's cars, trucks, factories, and power plants already cause various health ailments and contribute to thousands of deaths each year. What we're interested in is the additional toll caused by Volkswagen's illegal pollution.

This is a bit trickier to calculate. Certain types of nitrogen oxides are harmful both both because they can irritate the lungs and because they can help form damaging particulate pollution and smog. Higher smog levels have been linked to respiratory illnesses, increased asthma attacks, and even premature deaths (especially among the sick or elderly). The complicated part is that the exact levels of smog formation can vary from place to place, depending on sunlight, temperature, local winds, and other factors. What's more, the exact harm can depend on where the pollution occurs, how dense the area is, and so on.

Still, we can get ballpark figures using data from the Environmental Protection Agency, which calculates that every ton of NOx from vehicles in the United States leads to somewhere between 0.00085 and 0.0019 premature deaths. (Note that this only includes impacts from particulate formation, not smog effects, which are harder to quantify. See p. 40 of this report.)

Using these figures, the estimated extra pollution from Volkswagen's US cars can be expected to lead to an additional 5 to 27 premature deaths per year. If we extrapolated worldwide to all 11 million vehicles, that would come to somewhere between 74 and 404 premature deaths each year.***

Again, this is a back-of-the-envelope exercise, not a peer-reviewed scientific analysis. Criticisms and refinements are welcome. But the broader point is that air pollution can cause genuine harm, up to and including killing people. The United States and Europe have been trying to limit that health damage over the last 50 years by putting pollution limits in place. And, by evading those limits, Volkswagen's actions had real consequences.

(As counterpoint, Volkswagen's cheating might have been mildly helpful for global warming efforts. The company appears to have rigged the cars so that they would get slightly better fuel economy. And NOx emissions can have an indirect cooling effect. That said, this effect is likely to be smaller in the grand scheme of things. And this really isn't the way to go about solving climate change...)

Footnotes and updates:

* Here's how I estimate US pollution: the current Tier2-Bin5 lifetime standard for NOx emissions in the United States is 0.07 grams per mile driven. Testing by the ICCT has said Volkswagen's 482,000 clean diesel cars in the United States were emitting NOx at 15 to 35 times that standard, depending on how they were driven. And the average US car is driven 11,244 miles in a year. So multiply those numbers together, subtract out the "legal" pollution, convert to tons, and you get your range of additional pollution caused by VW's cars.

(Note that this estimate is for the current year. VW's cars were obviously sold in stages, so the pollution impact is smaller the further you go back in time.)

** For the global figures, I'm assuming the pollution controls in the remaining 10.5 million Volkswagen diesel cars with a Type EA 189 engine worked the same way and produced similar levels of additional pollution. I've updated this section by also assuming the rest of the cars were driven the European average of around 7,170 miles per year (since most of them were likely in Europe). That lowered the global pollution estimates from an earlier version.

*** This global estimate of health impacts might well be low, since a simple extrapolation from US data isn't ideal. The World Health Organization's research suggests that NOx pollution can have even higher mortality effects in some parts of Europe (due to higher population density), but we'd really have to know where the rest of Volkswagen's 11 million problematic diesel cars are being driven to get any more precise.

Volkswagen and the EPA's Dirty Little Secret
87 SEPT 23, 2015 3:50 PM EDT
By Editorial Board

Cheating reflects badly, first and foremost, on the cheater -- and so it is with Volkswagen, whose shocking manipulation of U.S. emissions tests continues to exact a price in market value, legal costs and reputation. At the same time, it's not unreasonable to ask how the cheating happened in the first place, and that question implicates more than just Volkswagen.

For years, automakers have been able to exploit lax testing systems in the U.S. and Europe. Regulators owe it to both car buyers and the environment to make these systems more rigorous.

As things work now in the U.S., carmakers test their own vehicles and send the results to the Environmental Protection Agency, whose engineers review them and, usually, apply a rubber stamp. The EPA allows manufacturers broad latitude in determining test conditions, an invitation to hanky-panky. The agency does some independent, random testing -- but on

just 10 percent to 15 percent of new models. Only in rare cases does it test cars that have actually been driven off the lot.

The problems with this regime were obvious even before VW's shenanigans. In 2013, Consumer Reports found that 55 percent of hybrids and 28 percent of turbocharged cars fell short of their EPA fuel-efficiency ratings. Last year, the Justice Department reached a $350 million settlement with Hyundai and Kia for overstating gas mileage. Ford, Mercedes, Mini and other manufacturers have restated their official mileage ratings in the last three years, usually under threat of consumer lawsuits.

Europe, where automakers also test their own vehicles, has its own issues. Just before the VW scandal broke, a European environmental advocacy group released test results showing major discrepancies between lab and real-world emissions in cars made by BMW, Mercedes and Opel. The European Commission has announced that all passenger cars will be undergo "real world" emissions testing starting in 2017.

Any system will inevitably rely on self-reporting to some extent. Government regulators simply don't have the money or personnel to test every new vehicle. But they can enact safeguards on a system that is all too easy for carmakers to game.

First, the EPA should have some of its engineers on hand at the industry labs to oversee compliance. Carmakers have a bevy of little tricks that can increase efficiency -- low-resistance tires, removing side mirrors and taping over cracks between panels -- and while the EPA has done better than the Europeans at closing loopholes, vigilance must be maintained. The agency should also vary the testing routines periodically so that carmakers won't know in advance exactly what they are in for. (The current regime's predictability may well have been a big part of VW's successful deception.) The EPA should consider following the EU's lead with on-the-road studies, for gas mileage as well as pollutants.

Also, the so-called defeat device VW used to game the emissions test was actually a pretty simple software tweak. It shouldn't be too hard for the EPA to invest in some computer forensic capabilities to track what's going on in our increasingly computerized vehicles.

Just as important, there need to be greater consequences for cheating. Any company caught in violation should lose its self-monitoring rights for a number of years. It should have to dig into its own pockets for trials by neutral third parties, such as parts manufacturers, which have the necessary equipment.

What Volkswagen did appears to be in a category all its own, and it deserves special condemnation. But other carmakers game the system, and regulators tolerate it. That is the dirty little secret of emissions and efficiency testing, and the EPA needs to clean it up.

Financial Times:
http://www.ft.com/intl/cms/s/0/bbd61c58-62d7-11e5-9846-de406ccb37f2.html#axzz3mgG3bZd2

EPA surprised by scale of Volkswagen's deceit
Barney Jopson in Washington and Andy Sharman in London

The US regulator that exposed Volkswagen for cheating on emissions tests has been taken aback by revelations that the German carmaker's deception extended to millions of vehicles far beyond American shores.

"It's clear that the company went above and beyond in its efforts to game the system and deceive consumers. The agency has a very robust emissions testing programme. So this deceit was significant," according to a senior Environmental Protection Agency official close to the investigation.

The EPA announced on Friday that VW had admitted installing "defeat device" software on 482,000 cars in the US.
But VW then shocked the regulator and the markets — sparking a two-day 37 per cent fall in its share price — by revealing that up to 11m vehicles worldwide could be affected.
"It's been surprising to see the scale of the deceit in terms of the number of vehicles impacted," the official said.

On Thursday the German government said VW executives had admitted to manipulating emissions tests on diesel-powered vehicles in Europe as well as the US.
The EPA official told the Financial Times the US regulator had been "engaged" with the German government over the matter even as it continued its own investigation.

"You'll continue to see news coming out of the agency on this" relating to VW, the official added.
The regulator is also "considering what our options are" regarding other auto manufacturers.
Several companies have come forward to say they have not engaged in similar cheating, the official said, and the EPA will continue working to ensure that is the case.

The EPA's concern about VW behaviour relates not just to the installation of defeat devices but to more than a year of dialogue between the regulator and the carmaker, another EPA official said. During that period VW repeatedly sought to attribute the difference between its cars' test results in the lab and on the road to a "technical glitch".

In May 2014, the EPA and a California state regulator were alerted to emissions discrepancies with a 2012 Jetta and a 2013 Passat by researchers at West Virginia University, which had analysed the results with the International Council on Clean Transportation, a non-profit research group.

Laboratory tests showed the VW cars complied with Clean Air Act rules, but when tested on the road the Passat's emissions were five to 20 times the official test result and the Jetta's emissions were 15 to 35 times the lab reading.

The German carmaker is engulfed in the worst scandal in its 78-year history over findings it manipulated diesel emissions test data in the US and Europe to make its vehicles appear less polluting
Following the West Virginia study, VW continued to assert that the increased emissions from the vehicles could be attributed to "various technical issues and unexpected in-use conditions", according to an EPA letter to VW about the violations last week.

VW tried — and failed — to fix the apparent problem with a voluntary recall last December affecting half a million vehicles in the US.
Only when the EPA told VW that it would not certify its 2016 models as emissions compliant did VW admit to the regulator on September 3 that it had used the defeat device.
The EPA carried out additional inquiries over the following 10 days to two weeks before deciding that it would send the company the official "Notice of Violation" released last Friday, the senior official said.

Volkswagen boss quits over diesel emissions scandal
BERLIN | BY ANDREAS CREMER

Volkswagen (VOWG_p.DE) Chief Executive Martin Winterkorn resigned on Wednesday, succumbing to pressure for change at the German carmaker, which is reeling from the admission that it deceived U.S. regulators about how much its diesel cars pollute.

"Volkswagen needs a fresh start - also in terms of personnel. I am clearing the way for this fresh start with my resignation," Winterkorn said, following a marathon meeting with the executive committee of the VW board.

The world's biggest carmaker by sales has admitted to U.S. regulators that it programmed its cars to detect when they were being tested and alter the running of their diesel engines to conceal their true emissions.

Volkswagen did not name a successor, but said proposals on management appointments would be made to a full board meeting on Friday.

Porsche chief Matthias Mueller, Audi chief Rupert Stadler and the head of the VW brand, Herbert Diess, are seen as the front-runners to replace Winterkorn, three people familiar with the matter said. Mueller is seen as the favourite among the three due to his years of experience within the group, two of the people said.

Mueller, a former head product strategist, is also a management board member of Porsche SE (PSHG_p.DE), and so close to the Piech-Porsche family that controls Volkswagen.

Winterkorn, who during his eight years in charge oversaw a doubling in Volkswagen's sales

and an almost tripling in profit, said he was shocked that misconduct on such a massive scale had been possible at the company.

The carmaker was under huge pressure to take decisive action, with its shares down more than 30 percent in value since the crisis broke.

German Chancellor Angela Merkel had urged Volkswagen to move "as quickly as possible" to restore confidence in a company held up for generations as a paragon of German engineering prowess.

The U.S. Environmental Protection Agency (EPA) said on Friday Volkswagen could face penalties of up to $18 billion.

Since then the crisis has snowballed, with the U.S. Justice Department launching a criminal inquiry, according to a source familiar with the matter. European and Asian countries as well as Canada have also said they are investigating the matter.

Senior members of Volkswagen's board said in a statement they expected more heads to roll as an internal investigation seeks to identify who was responsible for the wrongdoing.

German Economy Minister Sigmar Gabriel said Winterkorn was taking responsibility for decisions made when he was at the helm of Audi, rather than Volkswagen.

The VW Emission Bug
Why would the company install a 'defeat device' on its U.S. cars?
Sept. 23, 2015 6:38 p.m. ET

Volkswagen AG's reputation and share price have taken major hits after the Environmental Protection Agency and California Air Resources Board (CARB) last week accused the German auto maker of gaming vehicle-emission rules. VW deserves a keelhauling if the charges are true. But regulators and VW first should produce the motive and method for the alleged malfeasance.

On Friday the EPA in conjunction with CARB charged VW with installing "defeat devices" that disable nitrogen oxide emission controls in five of its clean-burning diesel models. EPA has threatened up to $18 billion in fines for the nearly half million cars VW sold in the U.S. between 2009 and 2015 that contain the device. The Justice Department is investigating.

VW's stock has since plummeted nearly a third. On Sunday CEO Martin Winterkorn promised to cooperate with regulators "to clearly, openly, and completely establish all of the facts of this case," including an external investigation. Volkswagen's U.S. chief Michael Horn apologized and said the company had been "dishonest."

On Tuesday VW said 11 million diesel cars world-wide were equipped with the device and it would set aside $7.3 billion, more than half of its annual profits, to cover penalties and recall costs. On Wednesday Mr. Winterkorn resigned. The slow-rolling revelations raise more questions.

To wit: Who decided to install the bugs, and what was their motivation? Did VW executives approve or know? Do the devices serve a purpose other than evading U.S. emission regulations? The public knows little outside the government narrative provided by EPA and CARB letters to VW last Friday.

The government investigation was prompted by a 2014 research project between West Virginia University and environmental nonprofit International Council on Clean Transportation, which found that NOx emissions from VW's 2012 Jetta and 2013 Passat soared in real world driving conditions and exceeded Clean Air Act regulations by five to 35 times.

After CARB confirmed the disparity between on-road and lab testing, VW in December 2014 recalled a half million cars to make software fixes. In May CARB reran its on-road test and determined that VW's adjustments didn't significantly reduce NOx emissions. CARB says it then met several times with VW, which suggested potential technical justifications for the discrepancy.

However, after the agencies threatened to withhold government certification for its 2016 diesel models, VW on Sept. 3 said the vehicles contained a "defeat device" to disable NOx emission-controls under normal driving conditions.

According to EPA, a software switch senses whether the car "is being tested or not based on various inputs including position of steering wheel, vehicle speed, the duration of the engine's operation and barometric pressure" and these "inputs precisely track the parameters of the federal test procedure." Under normal driving conditions, the switch activates a separate engine calibration.

In other words, the cars are electronically programmed to produce compliant emissions results only during government testing. On highways and streets, they spew 10 to 40 times as much as allowed under U.S. law.

Defeat devices aren't new or a diabolical German invention. As EPA notes, mechanisms that deactivate emissions controls may serve a legal purpose if they protect vehicles against damage. But manufacturers are then required to disclose to regulators their presence in certification applications, which VW didn't.

Two decades ago GM had to cough up $45 million for installing defeat devices in nearly half a million cars that overrode carbon monoxide controls. In 1998 seven U.S. manufacturers of heavy-duty diesel engines, including Caterpillar and Volvo Truck, settled federal charges of implanting devices that disabled NOx controls for $1 billion.

What regulators don't ever explain is that these defeat devices serve a functional purpose, which is usually to increase performance and fuel efficiency. They want to pretend that emissions regulations are a clean, free ride. Until now, VW—which advertised its environmental friendly and powerful engines—was in on the charade.

Auto experts have posited that VW's defeat device was intended to boost fuel economy and torque, which are two big draws of modern diesel cars. VW's 2015 Passat gets 44 miles per gallon on highways. Trouble is, engines that are designed to burn more efficiently—and therefore emit less carbon—release more NOx. They also have less oomph. EPA and CARB should fess up to this trade-off, and the wrongdoing involved ought to be precisely identified.

The immediate upshot is that VW will have to recall the lemons to bring them in compliance with government rules. Any fix will likely cost several thousand dollars per vehicle, reduce performance and increase carbon emissions. Will drivers even want the government's clean bill of health?

VW deserves to pay for any intentional wrongdoing, but the rest of the industry and the country need to know whether this is the great deception that EPA alleges or the kind of well-known regulatory trade-off that is being harshly punished for the first time.

This Small Study Helped Expose Volkswagen's Deception
Victor Luckerson @VLuck 11:15 AM ET

Their findings have been public for months

Before the Environmental Protection Agency was threatening Volkswagen with up to $18 billion in fines for cheating on emissions tests, a small research team in West Virginia already knew something was wrong with the automakers' vehicles.

A five-person engineering team at West Virginia University led by Daniel Carder first discovered discrepancies in the emissions rates for VW vehicles way back in 2013. The findings were made public about a year and a half ago, according to Reuters. "We actually presented this data in a public forum and were actually questioned by Volkswagen," Carder said.

Carder and his team initially though their testing was faulty because the results of their road tests were so out of whack with EPA standards. The findings were later corroborated by the EPA and the California Air Resources Board, leading to Volkswagen's admission that it installed illegal software in 11 million of its diesel cars to cheat on emissions tests. Volkswagen AG CEO Martin Winterkorn stepped down Wednesday; a replacement has not

yet been named.

Carder said seeing his findings confirmed and watching Volkswagen become embroiled in controversy was not especially exciting for him. "Obviously, we don't want to see something spewing emissions and polluting the environment," he told Reuters. "But we really have no horse in the race, as they say."

Detroit News:
http://www.detroitnews.com/story/business/autos/foreign/2015/09/24/vw-caught/72715074/

How VW got caught cheating emissions tests
David Shepardson, Detroit News Washington Bureau 12:14 a.m. EDT September 24, 2015

Washington — Volkswagen's monumental crisis over emissions-test cheating — which forced the resignation of its longtime CEO on Wednesday and threatens to cost the German automaker at least $7.3 billion — began with a routine test led by researchers in West Virginia two years ago.

Without that chance finding, VW might never have been caught using a bit of hidden software that allows pollution-control systems on 2.0-liter diesel cars to work normally when being tested for harmful emissions coming out of the tailpipe — but shuts those systems off during regular driving. That allowed 11 million cars worldwide to produce up to 40 times the allowable smog-forming pollution allowed in the United States.

"We're a tiny, non-governmental organization," Drew Kodjak, executive director of the International Council for Clean Transportation, said in an interview Wednesday. "It was really happenstance that this was ultimately uncovered."

In 2013, his organization commissioned a study of VW diesels by West Virginia University after questions were raised about European diesel emissions standards and whether European vehicles were emitting too much nitrogen oxides linked to smog. Testers looked at three diesel cars for the U.S. market: a 2012 VW Jetta, a 2013 VW Passat and a BMW X5.

The group expected the cars they tested would perform better than those in Europe, because U.S. regulations are tougher. They were surprised the two Volkswagens had significantly higher-than-expected emissions, while the BMW performed well. They were so certain they had done something wrong that they tested the cars two more times with similar results.

The researchers made their findings public in May 2014 in a report that got little attention. But it caught the notice of the Environmental Protection Agency and California Air Resources Board, which opened investigations.

The Detroit News has learned that, in response to tests by the EPA and CARB, the automaker actually issued two separate recalls labeled as service campaigns for certain cars:

one in December 2014, another in March. Software patches were VW's remedy, and the automaker assured the EPA and CARB that they fixed the problem. Out of 390,000 cars identified by VW at the time, about 196,000 were reflashed with new software.

CARB began testing VW's remedy in May. The California agency had developed a special dynamometer that showed the emission controls in the Volkswagens were not working properly. The software patch, in fact, did not cut exhaust emissions.

At the time, government officials never suspected VW was intentionally cheating. They kept looking for other potential problems. All summer long, VW kept offering "explanation after explanation," a person involved in the talks said Wednesday. "They did not add up."

Even through early August, government officials believed the automaker was acting in good faith. They thought other issues like a bad "dosing sensor" or a test problem could have accounted for the results.

In early August, EPA and CARB officials met with VW at an annual automotive conference in Traverse City to talk about the problem. By that time, California and EPA were withholding certification allowing 2016 diesel models to be sold until they were sure the recall fix would address the problem. VW said it had everything fixed.

Finally, at a conference in California on Aug. 20, an official from VW could not answer technical questions and admitted it had been intentionally cheating through so-called "defeat devices."

After months of work and testing, government officials were shocked at VW's admission of fraud.

The deception was sophisticated: Electronic control modules told the emissions controls to only work during emissions testing — something the computer could determine by the steering wheel position and other factors. That turned out to be a big clue for government investigators.

In a typical car, a dashboard indicator is supposed to light up if it's emitting more than allowable emissions. The Detroit News has learned the VW diesels were programmed not to activate those onboard diagnostics required of all cars since 1996 under the Clean Air Act.

On Friday, the EPA and CARB announced Volkswagen had admitted to installing defeat devices on 482,000 2009-15 Volkswagen Jetta, Passat, Sportwagen, Beetle and Audi A3 cars with 2.0-liter engines sold in the U.S. That included the 390,000 cars initially identified by the automaker, plus another 92,000. The cheat caused the cars to emit 10-40 times the allowable pollution.

By Tuesday, the automaker disclosed that 11 million diesel cars worldwide may have evaded clean-air rules. It could face U.S. fines of up to $18 billion — $37,500 per vehicle — as well as criminal prosecution.

People are shocked at the fraud, Kodjak said, "because of the deliberate nature, and the fact that this came from one of the greenest countries that's known for being extremely law-abiding."

Analysts speculated there are only three advantages to such a device: VW may have wanted to get higher fuel economy for the cars, better performance or avoid more expensive emissions controls like those on larger diesel VWs.

Industry, government and researchers say the automaker could have avoided criminal investigations and massive worldwide lawsuits linked to the admission that they cheated on emissions tests if their software fix had actually worked.

"Why didn't it work? That is literally one of my biggest questions is why didn't it work," Kodjak said. If it had, investigators may never have learned about VW's intentional fraud. "California told you they were going to check. If they had just fixed it then ... the only answer I can surmise is it is not easy."

Government officials expect VW will have to come up with three separate fixes since there are three generations of diesel engines that use different systems to prevent the release of smog-causing nitrogen oxides. It is not yet known whether a new software patch will suffice, or if new pollution-control equipment must be installed.

Boston Globe:
https://www.bostonglobe.com/business/2015/09/23/how-many-volkswagen-vehicles-massachusetts-are-affected-recall-lot/nxliz8S0LU9v5aEPyXbNmJ/story.html

How many Volkswagen vehicles in Mass. are affected by the recall? A lot
By Callum Borchers GLOBE STAFF SEPTEMBER 23, 2015

The tally is in on the number of diesel-engine Volkswagens in Massachusetts that will be subject to recall: 11,674.

According to the Registry of Motor Vehicles, that's how many cars fit the makes, models and years identified by the US Environmental Protection Agency as having a so-called "defeat device" that made them appear cleaner in emissions tests than they actually were on the road.

The EPA determined the vehicles — marketed as "clean" diesel cars — spew as much as 40 times what federal pollution limits allow.

Volkswagen chief executive Martin Winterkorn resigned Wednesday but claimed he did not know about the company's effort to cheat emissions tests, saying he was "stunned that misconduct on such a scale was possible in the Volkswagen Group."

Combining the EPA's description of affected vehicles with RMV statistics, the following list shows how many diesel cars of each type have been recalled in Massachusetts:

• Jetta model years 2009 to 2015: 3,562

• Jetta Sportwagen model years 2009-2014: 3,926

• Beetle model years 2012 to 2015: 81

• Beetle Convertible model years 2012 to 2015: 95

• Golf model years 2010 to 2015: 1,489

• Golf Sportwagen model year 2015: 159

• Passat model years 2012 to 2015: 1,998

• Audi A3 model years 2010 to 2015: 364

The EPA said roughly 482,000 cars nationwide are affected by the recall, and Volkswagen said the worldwide total exceeds 11 million.

The Tennessean:
http://www.tennessean.com/story/news/politics/2015/09/22/tn-senate-leader-requests-hearing-on-volkswagen-issues/72625196/

TN Senate leader requests hearing on VW cheating issues
Dave Boucher

A leader in the Tennessee Senate is asking a fellow lawmaker to call a hearing to look at how cheating revelations regarding Volkswagen may affect the state.

Senate Speaker Pro Tem Bo Watson, R-Hixson, notes the German automaker's significant investment in Tennessee as a reason he wants Senate Finance, Ways and Means Committee Chairman Randy McNally, R-Oak Ridge, to schedule a hearing.

"While all of the relevant facts may remain unreported at this time, I am very concerned as to the financial impact these violations could present to the state of Tennessee," Watson writes.

"As the chairman is aware, Tennesseans have made a significant investment in Volkswagen and any action that threatens the stability and sustainability of the investment should be reviewed by the finance committee, without delay," he continued later in the letter.

Tennessee provided Volkswagen with $165 million in grants in connection to its massive facility in Chattanooga, where more than 3,200 people are employed. Volkswagen received more than $577 million in incentives to build the plant in Chattanooga in 2008, The Associated Press reported. The AP also noted another state and local package worth up to $300 million was offered last year to persuade VW to expand the Chattanooga plant to build a new SUV in Tennessee as opposed to elsewhere.

Volkswagen CEO Martin Winkerton apologized Tuesday in the wake of accusations from the U.S. Environmental Protection Agency that the company had intentionally installed software that allowed its cars to cheat in emissions tests. The company said the emissions software affected 11 million cars worldwide.

On Tuesday it was reported the company has set aside more than $7 billion in anticipation of fines. USA TODAY reported recently that the car company could face $18 billion in fines from the federal government.

Volkswagen sets aside $7.3B over emissions scandal

On Monday Gov. Bill Haslam said he was concerned when he heard the revelations. He said he'd only spoken briefly with representatives from the EPA and Volkswagen.

"Volkswagen is somebody that is a major partner for us in the state of Tennessee, both in terms of investment and the jobs created. We're obviously very interested in their continued growth, but they're going to have to address this issue," Haslam told reporters Monday.

Lt. Gov. Ron Ramsey, R-Blountville, told the Chattanooga Times Free Press that the revelations are "depressing, hard to believe. On and on. We've made a huge investment."

Watson asked McNally to call the public meeting to discuss potential impact on Tennessee as soon as possible.

Volkswagen Sets Aside $7.2 Billion to Pay for Emissions Cheating Scandal
by PAUL A. EISENSTEIN

Volkswagen said Tuesday it is setting aside more than $7.2 billion to cover the anticipated cost of resolving its diesel emissions cheating scandal, a figure that could be eclipsed by potential penalties and lawsuits facing the German automaker in the U.S.

The issue, meanwhile, now is spreading to other markets, with VW confirming it used the same illicit software - dubbed a "defeat device" by U.S. regulators - on 11 million diesel vehicles sold worldwide. That has triggered calls for new investigations in markets from South Korea to the European Union.

The money that VW is setting aside, 6.5 billion euros, is part of the company's efforts to "win back the trust of our customers," VW said in a statement Tuesday.

Meanwhile, it noted that it is "working intensely" to find a technical solution to removing the software without reducing the performance of affected VW products. A total of 488,000 VW and Audi brand vehicles equipped with four-cylinder engines were recalled Friday, while the automaker ordered dealers to stop selling products equipped with those diesels.

Concerns about the mounting costs and potential impact to VW's reputation have led to a panic among the company's investors. On Monday, the value of VW shares plunged by 17 percent, and the sell-off was continuing midday Tuesday on the German exchange.

The crisis could lead to a shake-up in management at Volkswagen AG, industry analysts have warned.

The U.S. Environmental Protection Administration announced Friday that the automaker had surreptitiously equipped its diesel vehicles with software designed to recognize when those products were being tested on a dynamometer, essentially an automotive treadmill. In such a situation, the full complement of emissions controls systems would operate at their maximum, bringing the vehicles into compliance with U.S. - and even tougher California - emissions standards.

But once the testing would be completed, according to the EPA, the vehicles would revert to a different mode, effectively allowing emissions levels to increase by as much as 40 times.

In its new statement, VW gave more details, admitting that "discrepancies" related to vehicles with Type EA 189 engines and involved some 11 million vehicles worldwide.

"A noticeable deviation between bench test results and actual road use was established solely for this type of engine," the VW statement said. "Volkswagen is working intensely to eliminate these deviations through technical measures."

While the maker acknowledged the computer control systems on 11 million vehicles contain the code, it also claimed that the "majority of these engines the software does not have any effect."

The U.S. has the world's toughest diesel emissions standards, largely focusing on levels of micro-fine particulates and smog-causing oxides of nitrogen. In Europe, where the emphasis is on global warming gases like CO2, diesels handily meet test standards because they are so energy efficient.

Even so, there are mounting calls in Europe for a full investigation of the VW diesel test scandal, and CEO Martin Winterkorn has told Germany's transit ministry the company will fully cooperate with its investigation. Officials in South Korea also have called for an investigation.

Meanwhile, the U.S. Justice Department has reportedly taken the preliminary steps to open a criminal investigation.

Whether the $7.3 billion set aside is enough to cover VW's costs from the scandal remains to be seen. According to EPA rules, VW could be fined up to $37,500 for each vehicle not in compliance with emissions regulations, or a total of around $18 billion. California regulators could issue their own fines.

Several law firms also have taken initial steps of their own to bring class action lawsuits against Volkswagen on behalf of owners.

But perhaps the biggest question concerns the impact the scandal will have on VW's image and sales. The maker overtook Toyota to become the world's best-selling automaker during the first half of 2015. But it has been struggling to build momentum in the critical American market where about a quarter of its sales are diesel-powered vehicles. For now, VW has halted the sale of those models until it can come up with a fix for the faulty software.

Volkswagen probed by states over pollution cheating
Christie Smythe, Bloomberg News

Several states have begun an investigation into Volkswagen's admission that it equipped cars with technology to cheat federal air pollution tests, joining federal investigators and a growing list of countries probing the German automaker.

Wolfsburg, Germany-based Volkswagen said on Sept. 18 that it used "defeat device" software to beat emissions tests in labs. The diesel vehicles spewed as much as 40 times the legal limit of pollutants when they were on the road, the Environmental Protection Agency alleges. Volkswagen said it's cooperating with U.S. officials.

The matter may cost Volkswagen $18 billion in penalties from the EPA, based on a maximum $37,500 violation for each of nearly a half-million diesel versions of the VW Jetta, Golf, Beetle and Passat and the Audi A3.

Matt Mittenthal, a spokesman for New York Attorney General Eric Schneiderman, said in an e-mail today that he could confirm New York is part of the multistate group but was unable to say what other states were part of the probe.

The U.S. Justice Department has also begun a criminal probe, according to officials who spoke on a condition of anonymity.

The German government opened its own probe on Tuesday. Environment Canada also started an investigation, promising unspecified "enforcement action" if the car maker cheated in that country.

NY Times:
http://www.nytimes.com/2015/09/23/business/dealbook/volkswagen-debacle-on-financial-par-with-bp-oil-spill.html

Volkswagen Debacle on Financial Par With BP Oil Spill
SEPT. 22, 2015
By ANTONY CURRIE and OLAF STORBECK

— Volkswagen's cheating on clean air rules in the United States has driven investors into a deep funk.

The German carmaker's market capitalization shrank 16.6 billion euros, or $18.6 billion, in just over a day, after it was caught falsifying emissions on certain cars sold in the United States. The eventual cost could be higher. Although other carmakers have paid less for misdeeds, the better analogy might be oil: BP's 2010 Deepwater Horizon fiasco.

Rival carmakers got off relatively lightly for recent transgressions in the United States with more disastrous immediate consequences. General Motors paid $900 million to settle a lawsuit over faulty ignition switches linked to 124 deaths. Toyota paid $1.2 billion last year for malfunctioning accelerators tied to fewer fatalities.

No deaths can be directly pinpointed to Volkswagen blocking accurate checks on emissions – though the software installed in some vehicles hid levels of harmful nitrogen oxide up to 40 times above permitted levels.

The environmental twist perhaps makes BP's disastrous Gulf of Mexico oil spill a better comparison. Initial total cost estimates by analysts were as low as $3.5 billion. The final bill under the Clean Water Act was $5.5 billion, less than half the maximum fine. But BP's other costs, including damages, ballooned. All in, BP ended up setting aside almost $55 billion in fines, compensation and cleanup costs.

The Clean Air Act allows the Environmental Protection Agency to charge up to $37,500 a vehicle for any breaches. With 482,000 affected cars, that's $18 billion. The E.P.A. could be kinder than that, but Volkswagen, run by Martin Winterkorn, cheated government tests for six years, dissembled when confronted and meanwhile lauded Volkswagen's status as an environmentally sustainable carmaker.

Volkswagen can pay $18 billion, over time, and retain its credit rating. It has €21 billion in net cash, with more coming from planned divestitures.

That, though, doesn't factor in other costs, including recalls, refits, vehicle buybacks and class-action lawsuits – or the possibility that Volkswagen's emissions shenanigans were more pervasive. Diesel cars account for more than half its sales in Europe, its largest market, though with more lenient nitrogen oxide standards. If the scandal undermines the business case for Volkswagen's diesel engines, a €16.6 billion drop in value will look like a country jaunt.

http://www.washingtonpost.com/news/wonkblog/wp/2015/09/22/anatomy-of-volkswagons-deception-the-recall-that-never-fixed-any-cars/

Anatomy of Volkswagen's deception: The recall that never fixed any cars.
By Peter Whoriskey and Joby Warrick September 22 at 12:20 PM

Volkswagen's decision to equip 11 million vehicles with devices to cheat emissions tests worldwide has sent the company into an acute corporate crisis in recent days. But on December 2, 2014, the company assured U.S. and California regulators that their engineers had a straightforward solution.

Volkswagen told officials then that a software change would remedy the overflow of pollution emitted by their diesel cars, according to state and federal letters to the company. At the time, Volkswagen proposed a "voluntary recall" of about 500,000 vehicles. State and federal officials approved the plan.

That fix was either a technical failure or, some officials said, another ruse.

By May of this year, California tests showed that "the recall calibration did reduce emissions to some degree but NOx emissions were still significantly higher than expected."

The extent of the recall, which is discussed in letters between government and company officials, is unknown. Company officials wouldn't say this week how many recall notification letters Volkswagen issued to consumers, and how many consumers brought their cars in for the purported fix.

But the incident is one of the highlights in what federal and state officials have likened to a cat-and-mouse game between regulators and one of the world's largest automakers.

"They basically ran out of excuses," said Stanley Young, spokesperson for the California Air Resources Board. "They would say the tests weren't at the right temperature, or some other issue. We had them in [to our offices] several times."

EPA administrator Gina McCarthy said on Tuesday that the agency would step up efforts to look for cheating by other manufacturers, though she suggested that Volkswagen was an "outlier" in the extent of its cheating to defeat emissions standards.

"We are not going to sit down around and worry about whether or not there are other devices. We're going to find it," she said. "So right now we're upping our game in terms of going out and doing the work to take a look at what we need to do with other vehicles."

The company's dire diesel troubles have erupted over just a few days, but they were a long time in gestation.

The regulations that shaped the design of the diesel engines were put in place more than 15 years ago, when the EPA finalized rules that raised the emission standards for diesel cars.

After a years-long grace period, the tough standards were phased in between 2004 and 2007. At the time, the government acknowledged that meeting the standards for NOx, or nitrogen oxide, as well as soot, would be difficult.

"Manufacturers have expressed concerns that diesel-fueled vehicles would have difficulty meeting NOx and particulate matter levels like those contained in today's rule," EPA officials wrote in issuing the new standards. "Clearly, these standards will be challenging."

For a time, Volkswagen and other automakers stepped back from the U.S. diesel car market. It was a time to retool. Experts said the challenge of making a diesel engine clean enough for the U.S. standards - without compromising how the engine works - is very difficult.

"NOx is more of a challenge for diesel engines than it is for gasoline engines," said John Storey, distinguished research and development staff member at Oak Ridge National Laboratory. "The strategies companies use to clean them up all have an impact on performance, fuel economy and maintenance."

The engineering hurdles in controlling diesel emissions are high enough, some experts said, that they may provide an incentive for companies to skirt the rules.

"I can't say I'm surprised," John M. DeCicco, Ph.D. Research Professor at the University of Michigan Energy Institute, of the recent revelations. "The temptation to game the system with a defeat device is definitely high because of the technical challenges."

In 2008, Volkswagen came back with a diesel version of the Jetta. The company touted it as an example of the "clean diesel." It won raves, including "Green Car of the Year" at the Los Angeles Auto Show.

"After a three-year break that seemed interminable to fans, Volkswagen's back in the U.S. diesel-car market with a clean-burning diesel in its popular Jetta compact sedan," USA Today told readers.

But what seemed like a breakthrough seems now, in the light of recent revelations, like a massive cheat.

The company's two-liter diesel engines in the U.S. had been equipped with a "defeat device" that allowed the cars to pass federal emissions tests despite emitting more than 10 times the permitted amounts of NOx when it is on the road. Those emissions help produce smog on hot summer days, triggering a variety of health problems, particularly for asthmatics and other people with breathing difficulties.

As has been widely reported, the emission problems were detected in a May 2014 report by the International Council on Clean Transportation and West Virginia University.

The results were presented to the company and several months later, in December 2014, the company told California regulators that they had a fix. They would "recalibrate" the software that runs the engine.

"Based on this meeting, VW initiated a voluntary recall...This recall was claimed to have fixed among other things, the increased real world driving NOx issue," according to a

recent letter from the California Air Resources Board to the company.

By May of this year, California officials had run road tests on cars altered as under the recall. Despite the fix, the car showed higher than expected NOx emissions. California engineers also created a special dynamometer test, apparently to address company concerns that the previous testing was unfair.

California Air Resources Board "has determined that the previous recall did not address the high on-road NOx emissions, and also resulted in the vehicle failing certification standards," it told the company earlier this month.

McCarthy, speaking to reporters in Washington, acknowledged that the Volkswagen software ruse was "particularly difficult for us to detect. We haven't found similar types before but we'll take a look and make sure we're attacking it successfully," she said.

McCarthy defended the EPA's regulatory standards as reasonable, and said most other car manufacturers appear to have found a way to comply.

"This is about a NOX emission standard that was put in place a few decades ago. The industry knew what was happening. We feel pretty confident the industry has been innovating to be able to meet this standard," she said. "So we don't think that this problem with the standards at all."

McCarthy said she was gratified by Volkswagen's aggressive response in acknowledging its mistakes, even as she criticized the company for its years of deliberate deception.

"I think it will be very difficult for Volkswagen at this going to be looked at as anything other than a real outlier," she said.

How VW's 'defeat device' cheated on EPA emissions tests
Clive Cookson, Science Editor

The "defeat device" that Volkswagen used to cheat on US emissions testing sounds as if a secret little black box was hidden deep in the diesel engine just waiting to switch anti-

pollution controls on during government inspections.

During normal driving, these controls are relaxed, which improves performance and reduces engine wear.

"The test cycles are very formal and well established, so priming a vehicle to sense when it is being tested is potentially quite straightforward," said Professor Alastair Lewis, an air pollution expert at York University in the UK. "For example are only its drive wheels turning, is the acceleration unnaturally smooth, or constant speeds too precise for a human driver?"

Modern "clean diesel" engines aim to reduce pollution in a series of computer-controlled steps. For example, the computer may adjust the ratio of air to fuel in the combustion chamber, change the operating temperature or alter the rate at which exhaust gases flow through catalytic converters and filters.

Another refinement is to inject a chemical called urea into the exhaust stream. It then reacts with polluting nitrogen oxides (NOx) and converts them into harmless nitrogen and water.

"A huge amount of complex electronics controls it all," said Roger Kemp, professor of engineering at Lancaster University. "The code in the software gives thousands of different usage patterns corresponding to different combinations of inputs.

"There is a trade-off between pollution control and engine performance," Prof Kemp added. For example running at a hotter temperature may cut emissions but reduce engine life.

Bosch, the German car parts company, supplies components to VW, including fuel injection and exhaust treatment systems that reduce emissions. But people familiar with the cars said VW writes the software that deploys the equipment.

According to the EPA's notice of violation, the software ran the engine with "dyno calibration" settings designed to minimise pollution when it detected testing in progress (dyno refers to dynamometer equipment at the test centre). For the rest of the time it ran on "road calibration" which puts less emphasis on reducing emissions.

Even when the software switches to road running, a modern diesel engine is much less polluting than its filthy predecessors, Prof Kemp pointed out. Its filters and combustion chamber are particularly effective at cutting emissions of the tiny soot particles that used to belch out of ill-tuned engines (and still do in parts of the developing world).

The EPA allegations focus on NOx, reactive gases that are one of the main sources of urban smog and lung-irritating ozone pollution. The violation came to light when researchers at West Virginia University tracked emissions from VW diesel cars on the road and found that NOx soared to levels 10 to 40 times higher than the EPA permits.

Many air pollution experts have long believed that other manufacturers operate their own

versions of VW's defeat devices.

"Virtually all new vehicles in recent years appear to emit substantially more NOx in the real-world than they do when tested in labs, irrespective of manufacturer," said Prof Lewis. "VW appear to have been caught red-handed, but it would seem highly likely that others have also played dubious games to pass emissions tests."

Ian Colbeck, professor of aerosol science at the University of Essex, commented: "It has been observed for some time that real world driving conditions do not deliver the emission reductions shown in the laboratory. The European Commission will require real world tests in 2017."

Volkswagen emission scandal widens: 11 million cars affected
Nathan Bomey

Investors crush Volkswagen shares as company sets aside $7.3 billion to address software that manipulates emissions tests.

Volkswagen's emissions scandal ballooned Tuesday as the automaker said it affects 11 million vehicles worldwide and will require the company to set aside 6.5 billion euro ($7.3 billion).

The startling admission instantly makes the crisis one of the most expensive automotive scandals in recent memory.

The crisis also threatens to upend the company on its rapid path to becoming the world's largest automaker. Volkswagen had seized the title from Toyota for the first six months of 2015.

"This could damage the Volkswagen brand globally for years to come," said former automotive marketing executive Peter De Lorenzo, blogger at Autoextremist.com, in an interview. "Trust and belief in the brand has been broken."

Volkswagen CEO Martin Winterkorn pledged to regain the public's trust and rectify the company's mistakes, amid speculation that he could lose his job over the crisis. Winterkorn's contract, coincidentally, is up for renewal at the automaker's board meeting Friday.

In a video statement Tuesday he said he's "endlessly sorry" for the situation but pledged to stay on the job, according to several reports translating the German remarks.

Investors crushed the Germans automaker's stock, driving shares down 18% as of 9:47 a.m. ET, a day after the stock plunged 19%.

The crisis began Friday when the U.S. Environmental Protection Agency accused Volkswagen of installing sophisticated software on nearly 500,000 U.S. vehicles to manipulate emissions tests.

The technology tricks regulators into believing that 4-cylinder diesel vehicles comply with emissions standards, but the cars are actually admitting harmful pollutants at rates of up to 40 times acceptable standards. Volkswagen quickly halted sales of the cars after the allegations surfaced.

The U.S. Justice Department has opened a criminal probe into the automaker's actions. The EPA's own investigation is ongoing, and foreign regulators are expected to launch their own probes.

"Volkswagen is working at full speed to clarify irregularities concerning a particular software used in diesel engines," the company said Tuesday in a statement.

The "discrepancies" affect vehicles with what it called "Type EA 189 engines," causing "a notable deviation between bench test results and actual road use."

The company added: "Volkswagen is working intensely to eliminate these deviations through technical measures."

Volkswagen said it would set aside 6.5 billion euro in its third quarter to address the matter and warned that the number could change.

In the U.S., the EPA could fine Volkswagen up to $37,500 per car, which would equal a maximum fine of some $18 billion.

"Volkswagen does not tolerate any kind of violation of laws whatsoever. It is and remains the top priority of the Board of Management to win back lost trust and to avert damage to our customers," the company said.

The scandal raises serious questions about whether high-level executives knew about the software, which had been installed on some nameplates for at least six consecutive model years.

Earlier this month a subcommittee of Volkswagen's board recommended that the full panel extend Winterkorn's contract through 2018. The official renewal at Friday's board meeting was viewed as a routine matter, but now it may be up in the air.

Winterkorn kept his job earlier this year after then-chairman Ferdinand Piech tried to displace him. Piech exited the company shortly after his failed effort.

De Lorenzo, the automotive marketing veteran, said Winterkorn will be forced to answer questions about his knowledge of the emissions scandal.

"He's very much detailed-oriented. He's always regaled his underlings with his depth of knowledge of detailed items that they would assume he wouldn't bother with," De Lorenzo said. "I think heads will roll and this could bring down Winterkorn and some of his trusted lieutenants."

Dave Sullivan, an analyst with AutoPacific, said the "chances of him coming out unscathed have got to be very small."

The EPA has said the company admitted to installing the software. The agency said the software affected the four-cylinder diesel versions of the 2009 to 2015 Jetta, Beetle, Golf, the 2014 and 2015 Passat and the 2009 to 2015 Audi A3.

The episode is likely to trigger a recall and a flurry of consumer lawsuits. It may prompt the company to compensate individual car owners or other measures.

European regulators are expected to place Volkswagen under intense scrutiny. But it scandal also could bode poorly for Volkswagen in the world's largest vehicle market, China, where Volkswagen is No. 1 by market share.

"The problem is the Chinese are starting to realize they have got to do something with their air and this could have an effect on the relationship the Chinese have with Volkswagen," Sullivan said.

The Environmental Protection Agency is working on new tests to detect cheating on the part of automakers in the wake of Volkswagen AG's massive cheating scandal.

EPA Administrator Gina McCarthy told reporters at a Wall Street Journal forum on Tuesday that the agency won't sit still and is "upping its game" to catch cheaters.

VW was able to evade U.S. emissions requirements for 482,000 2009-2015 diesel cars by using sophisticated software that only turned on emissions equipment during testing. It's not clear if VW did that to boost low-end torque, raise fuel efficiency or avoid more costly emissions requirements.

The fact that VW was able to get away with the cheating for nearly seven years suggests the agency must take new steps to detect bad behavior, analysts say. Cars are very sophisticated machines with more than 100 million lines of code.

The VW emissions issue came to the attention of the EPA in 2014 after independent analysis by researchers at West Virginia University — working with the International Council on Clean Transportation, a non-governmental organization — raised questions about emissions levels. After extensive testing, EPA confirmed that the vehicles were emitting up to 40 times the allowable pollution in road use.

The EPA told The Detroit News on Friday that it was investigating whether other automakers had similar problems. But McCarthy said so far it appears VW is an "outlier."

This will not be the first time in recent years that EPA has had to change its rules to ensure companies are complying with emissions.

In February, the EPA issued new guidelines to automakers for conducting fuel economy testing. The move came after five major automakers have had to restate mileage ratings for certain models.

The guidelines detail how vehicles must be prepared before being tested — including what is an acceptable level of wear on the tires and how vehicles should be broken in prior to testing.

Also at issue are tests used to determine the impact of aerodynamic drag and tire rolling resistance on gas mileage. Currently, that is measured at 50 miles per hour. Under the new guidelines, automakers must measure the results at all speeds up to 70 mph.

In 2014, the agency said it was considering writing new formal regulations covering mileage labeling by automakers. Instead, it is opting to issue the guidelines. It typically takes EPA two to three years to write new legal binding mandates.

Chris Grundler, the EPA's director of the Office of Transportation and Air Quality, said in an interview in February that "it's a very dynamic time" in the auto industry, and the agency doesn't want to spend several years crafting rules that could be outdated when issued.

"Writing regulations takes time," Grundler said. "When you are working in the rapidly changing environment that we're in right now, we want to make sure that we are agile enough and flexible enough to change with those times."

He said new guidelines are aimed at getting better results. He noted that the EPA will follow the guidelines when it conducts audits of automaker testing.

In November, Korean automakers Hyundai Motor Co. and Kia Motors Corp. agreed to a record-setting $360 million settlement for overstating fuel economy ratings for 1.2 million 2011-13 U.S. vehicles. The settlement includes a $100 million civil penalty, forfeiting $210 million in greenhouse gas emission credits and spending $50 million to ensure independent auditing of its current and future vehicles.

After an investigation by the EPA, Hyundai and Kia in November 2012 agreed to restate expected gas mileage for 1.1 million vehicles in North America, including 900,000 in the United States. That reduced Hyundai-Kia's fleetwide average fuel economy from 27 to 26 mpg for the 2012 model year. Hyundai was forced to abandon claims that four models got 40 mpg.

In August 2013, Ford Motor Co. dropped mileage ratings for the 2013 C-Max hybrid from a combined 47 mpg to 43 mpg. In June 2014, Ford Motor Co. said it is lowering the fuel ratings on six new cars and would make payments of $125 to $1,050 to more than 200,000 owners.

The move was a significant embarrassment to Ford, which has emphasized the fuel efficiency of vehicles in its lineup. It was he second time in a year that Ford has had to correct its mileage numbers.

Under current rules, Ford was able to assign the same fuel efficiency rating to the C-Max as the Fusion hybrid because they're in the same family. While that's worked for conventional cars, it hasn't been as accurate for hybrids.

Other German automakers besides VW have faced EPA scrutiny. In October, BMW AG agreed to reduce its fuel economy ratings on four 2014 Mini Cooper models.

BMW reduced the combined fuel economy of the three-door manual transmission to 33 miles per gallon from 34 mpg, the three-door semi-automatic from 33 to 32, the Cooper S 3-door manual from 29 to 28 and the semi-automatic version from 31 to 30. The biggest fall is in the highway rating for the Cooper S 3-door manual will fall from 38 to 34 mpg.

Also last year, another Daimler AG agreed to lower the mpg ratings on two of its Mercedes-Benz vehicles after a government audit turned up a problem.

Mercedes-Benz made minor changes to two models. It will reduce the city mpg figure for the 2013-14 C300 to 19 mpg from 20 mpg, but the combined 22 mpg and 27 mpg highway value will remain the same. For the 2013-14 4-Matic PZEV the combined mpg fell to 22 mpg from 23 mpg, while the city and highway mpg figures both fell by 1 mpg to 19 and 28, respectively.

VW CEO: 'Endlessly sorry' as emissions scandal escalates
By Geir Moulson and Pan Pylas | AP September 22 at 11:32 AM

BERLIN — The crisis enveloping Volkswagen AG, the world's top-selling carmaker,

escalated Tuesday as the company issued a profit warning following a stunning admission that some 11 million of its diesel vehicles worldwide were fitted with software at the center of a U.S. emissions scandal.

The German company said it was setting aside around 6.5 billion euros ($7.3 billion) to cover the fallout from the scandal that has tarnished VW's reputation, raised questions over the future of CEO Martin Winterkorn and battered its share price.

Winterkorn pledged a fast and thorough investigation.

"Millions of people across the world trust our brands, our cars and our technologies," he said in a video message. "I am endlessly sorry that we have disappointed this trust. I apologize in every way to our customers, to authorities and the whole public for the wrongdoing."

"We are asking, I am asking for your trust on our way forward," he said. "We will clear this up."

The VW Logo is photographed at a car at the Car Show in Frankfurt, Germany, Tuesday, Sept. 22, 2015. Volkswagen has admitted that it intentionally installed software programmed to switch engines to a cleaner mode during official emissions testing. The software then switches off again, enabling cars to drive more powerfully on the road while emitting as much as 40 times the legal pollution limit. (Michael Probst/Associated Press)
The damage to Volkswagen's reputation is reflected in the market's response. Volkswagen's share price slid a further 16.2 percent Tuesday to a near four-year low of 112 euros. The fall comes on top of Monday's 17 percent decline.

The trigger to the company's market woes was last Friday's revelation from the U.S.'s Environmental Protection Agency that VW rigged nearly half a million cars to defeat U.S. smog tests.

The company told U.S. regulators that it intentionally installed software programmed to switch engines to a cleaner mode during official emissions testing. The software then switches off again, enabling cars to drive more powerfully on the road while emitting as much as 40 times the legal pollution limit.

"In my German words: we have totally screwed up," the head of Volkswagen's U.S. division, Michael Horn, told an audience in New York on Monday.

In a statement Tuesday, Volkswagen gave more details, admitting that there were "discrepancies" related to vehicles with Type EA 189 engines and involving some 11 million vehicles worldwide. The number of vehicles involved is more than the 10 million or so cars it sold in 2014.

Volkswagen said it is "working intensely" to solve the problem and that it "does not tolerate any kind of violation of laws whatsoever."

To cover the necessary service measures and what Volkswagen says are "other efforts to win back the trust" of customers, the company said it is setting aside some 6.5 billion euros in the current quarter. There was no mention of fines or penalties in the company's statement. The EPA has indicated that it could, in theory, fine VW up to $18 billion.

The Guardian:
http://www.theguardian.com/business/2015/sep/22/vw-scandal-caused-nearly-1m-tonnes-of-extra-pollution-analysis-shows

VW scandal caused nearly 1m tonnes of extra pollution, analysis shows
Emissions could have far greater impact in Europe, where almost half passenger cars are diesel, than the US
Karl Mathiesen and Arthur Neslen

Volkswagen's rigging of emissions tests for 11m cars means they may be responsible for nearly a million tonnes of air pollution every year, roughly the same as the UK's combined emissions for all power stations, vehicles, industry and agriculture.

The carmaker has recalled 482,000 VW and Audi brand cars in the US after the Environmental Protection Agency (EPA) found models with Type EA 189 engines had been fitted with a device designed to reduce emissions of nitrous oxides (NOx) under testing conditions.

A Guardian analysis found those US vehicles would have spewed between 10,392 and 41,571 tonnes of toxic gas into the air each year, if they had covered the average annual US mileage. If they had complied with EPA standards, they would have emitted just 1,039 tonnes of NOx each year in total.

On Tuesday the company admitted the device may have been fitted to 11 million of its vehicles worldwide. If that proves correct, VW's defective vehicles could be responsible for between 237,161 and 948,691 tonnes of NOx emissions each year, 10-40 times the pollution standard for new models in the US. Western Europe's biggest power station, Drax in the UK, emits 39,000 tonnes of NOx each year.

In the US, just 3% of passenger cars are diesel compared to almost half in the EU. Professor Martin Williams from King's College London said the US's low percentage of diesel cars meant higher diesel emissions in some cars would have a "limited effect" on air quality there.

"[In the US it would be] nowhere near the effect it would have in this country and in the rest of Europe for that matter," he said. In the UK, Williams added, emissions from diesel cars cause roughly 5,800 premature deaths each year. "If you were to make the cars emit at the legal limit you could reduce those deaths by at least a factor of two and maybe more. Maybe a factor of five."

The Clean Air in London campaign called for a royal commission to investigate carmaker's activities in the UK.

"Diesel is without doubt the biggest public health catastrophe in UK history. Even the black plague didn't affect everyone in the population," said founder Simon Birkett.

Not all NOx emissions – which include nitrogen dioxide (NO2) and nitrogen oxide (NO) – are dangerous. But an increasing proportion of the toxic NO2 gas has been detected in EU diesel emissions. A study in the British Medical Journal in May found that short term exposure to NO2 increased the number of premature deaths from heart and lung disease by 0.88% and 1.09%.

For years, UK air pollution measurements have failed to show improvements in air quality, even as standards have tightened.

"Since 2003 scientists have been saying things are not right. It's not just the VW story, this is part of something much bigger," said Dr Gary Fuller, also of King's College. "It has a serious public health impact."

Last week, a report from NGO Transport & Environment found that Europe's testing regime was allowing nine out of every 10 new diesel vehicles to breach EU limits. Testing regimes in the EU are known to fail to pick up "real world" emissions because cars are not driven in the same way in the laboratory as on the road. Some studies suggest the discrepancy may be up to seven times the legal limit.

Williams said being able to mask their NOx emissions would also enable carmakers to pass carbon emissions tests more easily as there was a trade-off between NOx and CO2 in diesel engines.

Catherine Bearder MEP, a lead negotiator on the EU's new air quality laws, said: "Manufacturers in the US have been caught out, but we know that pollution limits are also being breached in Europe... Unless we take action, thousands of lives will continue to be tragically cut short by air pollution."

In a sign that the emissions scandal will not remain restricted to the US, a Venice court will next month hear a case against VW and Fiat for misleading test advertising.

The Italian consumer rights group Altroconsumo is due to press its case for a class action suit against VW and Fiat on 2 October, after laboratory tests showed that fuel consumption and CO2 emissions from the VW Golf 1.6 and Fiat Panda 1.2 were up to 50% higher than claimed.

Altroconsumo wants the German car firm to pay damages of €502 (£365) to the owner of a VW Golf, in a case that raises the possibility of widescale compensation payouts by the car industry.

Monique Goyens, the director of the European consumer rights umbrella group BEUC, which includes Altroconsumo, called for an investigation by the European Commission into the use of software programmes to 'game' European emissions tests.

"The VW scandal has compounded our concern that underhand tactics are also being used in fuel consumption and CO2 testing programmes in Europe," she said. "One of the problems in the EU, unlike in the US, is the absence of a market surveillance system which would require independent in-use conformity testing. The EU needs to implement such a system to restore trust amongst consumers."

On Tuesday, the Italian government launched an investigation into VW's emissions testing regime.

Wired:
http://www.wired.com/2015/09/vw-fool-epa-couldnt-trick-chemistry/

VW Could Fool the EPA, But It Couldn't Trick Chemistry
Eric Niiler

FOR DECADES, AUTOMAKERS HAVE been caught between building an engine that squeezes a lot of energy out of the fuel it burns and one that has low emissions. It's not an easy tension to resolve. "Negotiating both fuel consumption and emissions is a hard tradeoff," says Anna Stefanopolou, professor of mechanical engineering at the University of Michigan.

When engineers at Volkswagen allegedly inserted a few lines of code into the diesel cars' electronic brains to circumvent emissions testing, they found a solution to this existential automotive conflict. Drivers got low emissions during the test, and high performance the rest of the time. The only problem: It's way outside of the rules. The company might have gotten away with it, too, if it hadn't been for those pesky engineers—and the basic chemistry of the diesel engine.

According to the US EPA, those lines of code hid the fact that nearly half a million diesel VWs in the US spewed up to 40 times more nitrogen oxide from their tailpipes than testing indicated. Volkswagen has now confirmed that the problem actually affects approximately 11 million diesel cars worldwide. Diesel engines use a different mix of fuel than gasoline engines and don't use spark plugs to induce combustion—relying instead on highly compressed, heated air and fuel injected as droplets. If a diesel engine doesn't get enough oxygen to combust the fuel, it'll emit all kinds of gunk—nitrogen oxides, uncombusted fuel, and particulate matter (soot, basically).

All that gunk is a big problem. Exposed to sunlight, nitrogen oxides convert to ozone—making smog. How much depends on a bunch of variables, like sunlight exposure and what happens to the hydrocarbon emissions (the uncombusted fuel), plus the

temperature and local winds.

However much extra crap came from the VWs, it won't be good. Exposure to nitrogen oxide and ozone is linked to increased asthma attacks, respiratory illnesses, and in some cases premature death. Ozone also worsens existing cardiovascular and lung disease.

To deal with those emissions, "you have a whole chemical factory at the tailpipe that traps the oxides," Stefanopolou says. This bumps the sticker price for diesel cars by $5,000 to $8,000 per vehicle. (On the other hand, diesels get better mileage, especially in highway driving.)

For years, diesel trucks and buses were the biggest polluters on the highway. But carmakers adapted a relatively new technology called selective catalytic reduction—the same tech that scrubs pollutants from factory smokestacks—to the tailpipe of the diesel engine.

Here's how it works: Inside a honeycombed chamber, the scrubbing system sprays a liquid made of 30 percent urea and 70 percent water into the diesel exhaust. This sets off a chemical reaction that converts nitrogen oxides into nitrogen, oxygen, water and small amounts of carbon dioxide—molecules that aren't as harmful to human health. Catalytic scrubbing was supposed to cut diesel NOx emissions up to 90 percent, according to the Diesel Technology Forum, an industry group based outside Washington. That made diesel engines clean enough to use in passenger cars, which have stricter emissions rules.

The scrubbing chemistry is also what gave away Volkswagen's alleged cover-up. In 2013, a small non-profit group decided to compare diesel emissions from European cars, which are notoriously high, with the US versions of the same vehicles. A team led by Drew Kodjak, executive director of the International Council on Clean Transportation, worked with emissions researchers at West Virginia University to test three four-cylinder 2.0-liter diesel cars in the Los Angeles area: a Jetta, a Passat, and a BMW. Only the BMW passed.

"We felt that it would be possible to get low emissions for diesels," Kodjak said. "You can imagine our surprise when we found two of the three vehicles had significant emissions."

The ICCT reported its findings to the EPA and the California Air Resources Board. Regulators met with VW officials in 2014 and the automaker agreed to fix the problem with a voluntary recall. But in July 2015, CARB did some follow up testing and again the cars failed—the scrubber technology was present, but off most of the time.

How this happened is pretty neat. Michigan's Stefanopolou says computer sensors monitored the steering column. Under normal driving conditions, the column oscillates as the driver negotiates turns. But during emissions testing, the wheels of the car move, but the steering wheel doesn't. That seems to have have been the signal for the "defeat device" to turn the catalytic scrubber up to full power, allowing the car to pass the test.

Stefanopolou believes the emissions testing trick that VW used probably isn't widespread in the automotive industry. Carmakers just don't have many diesels on the road. And now that

number may go down even more.

IEEE Spectrum:
http://spectrum.ieee.org/cars-that-think/transportation/advanced-cars/how-professors-caught-vw-cheating

How Engineers at West Virginia University Caught VW Cheating
By Philip E. Ross

Volkswagen, which had just become the biggest-selling automaker in the world, has now been nabbed committing perhaps the biggest corporate cybercrime of all time.

Its diesel cars were found to have cheated systematically on emissions tests run by the United States Environmental Protection Agency (EPA) over the past seven years. When the control system sensed that a test was under way, it would order the engine to ix-nay on the ox-nay—NOx that is, or nitrous oxides—long the bugbear of diesel engines. Later, when the coast was clear, the system would let the NOx pour out at up to 40 times the allowed levels in order to optimize fuel economy.

This dirty trick allowed for a clean getaway for some 482,000 cars under the VW and Audi brand names, including the VW Jetta and the Audi A3. The EPA found out, VW admitted wrongdoing, and it stopped selling the offending vehicles. Its shares lost more than 0ne-fifth of their value in the early hours of the next trading day.

But the guys who found the clues to the crime say they weren't looking for trouble—they were just working under contract to a clean-transportation group that wanted to convince European regulators to adopt stricter emissions standards, as the United States has done.

"We had no cause for suspicion; we thought the vehicles would be clean," John German, of the International Council on Clean Transportation, told Bloomberg news.

The ICCT subcontracted the testing to the University of West Virginia's Center for Alternative Fuels, Engines and Emissions (CAFEE). Its engineers compared emissions measured on a road trip to results from the same cars that their colleagues were getting in the lab. The discrepancies were great.

Dan Corder, head of WVU's Center for Alternative Fuels, Engines, and Emissions (CAFEE)
Some people have mischaracterized what our role was," says Dan Corder, who heads up CAFEE. "Some have used the phrase 'tipped off the EPA.' We didn't."

The engineers from CAFEE reported on these preliminary results in spring of 2014 at the Coordinating Research Council's Real-World Emissions Workshop, which was held in San Diego that year. Corder hastens to add that the results, based as they were on a handful of cars, were preliminary and that they researchers drew no conclusions. According to Corder:

We said, these are two vehicles. We're presenting what we can present. EPA people were in the audience. And the ICCT publicized the results on its website, then delivered them to the EU's Joint Research Center.

Volkswagen Says 11 Million Cars Worldwide Are Affected in Diesel Deception
By JACK EWING SEPT. 22, 2015

FRANKFURT — A scandal that has undermined Volkswagen in the United States spread to its core market of Europe on Tuesday, after the company said that 11 million of its diesel cars worldwide were equipped with software that was used to cheat on emissions tests.

Volkswagen did not provide information on where the affected cars are, but the overwhelming majority are probably in Europe, where the company dominates the market and accounts for more than one of every four cars sold.

The German automaker said it was setting aside the equivalent of half a year's profits — 6.5 billion euros, or about $7.3 billion — to cover the cost of fixing the cars to comply with pollution standards and to cover other expenses, which are likely to include fines as well as responses to civil lawsuits from angry customers.

The carmaker's statement was its first admission that diesel cars outside the United States may contain the software that led the Environmental Protection Agency to accuse the company of deliberately evading pollution tests. Previously, Volkswagen had acknowledged only that the problem affected about 500,000 vehicles in the United States.

The tampered vehicles use what is known as Type EA 189 engines, which are 2-liter engines. The company said on Tuesday that "a noticeable deviation between bench-test results and actual road use was established" for the engines.

Volkswagen said it would also make "other efforts to win back the trust of our customers."

The number of cars involved suggests that the scale of the damage to Volkswagen's reputation and its financial standing may be even greater than thought.

Volkswagen shares fell by nearly 18 percent through late-afternoon trading in Frankfurt on Tuesday, after falling by 16 percent on Monday.

The diesel cars were programmed to sense when emissions were being tested and to turn on equipment that reduced emissions, according to United States officials. At other times, the cars had better fuel economy and performance, but produced as much as 40 times the allowed amount of nitrogen oxide, a pollutant that can contribute to respiratory problems including asthma, bronchitis and emphysema.

"Volkswagen is working intensely to eliminate these deviations through technical measures," the company said.

It is not clear, though, how fully Volkswagen might be able to correct the problem on the 11 million vehicles. The company could presumably alter the engines, so that the cars on the road begin actually meeting the required emissions standards. But doing so would probably degrade the vehicles' fuel economy and performance, and might cause the engines to wear out sooner.

The E.P.A. has ordered Volkswagen to recall almost a half-million vehicles sold in the United States from 2009 to 2015. The affected Golf, Passat, Jetta and Beetle cars were equipped with 2-liter diesel engines. Some Audi models also use the same diesel engine.

Volkswagen has halted sales of cars with the engines in the United States.

Volkswagen CEO's days appear numbered as emissions crisis deepens
BERLIN | BY ANDREAS CREMER

Martin Winterkorn's days as head of Volkswagen AG appeared numbered on Tuesday after the German carmaker said a scandal over falsified vehicle emission tests in the United States could affect 11 million of its cars worldwide.

The Tagesspiegel newspaper, citing unidentified sources on Volkswagen's supervisory board, said the board would decide on Friday to replace Winterkorn with Matthias Mueller, the head of the automaker's Porsche sports car business.

A Volkswagen spokesman denied the report. The company later said it would post a video statement by Winterkorn at 1500 GMT. A spokesman for Porsche said Mueller was attending a Volkswagen board meeting at its headquarters in Wolfsburg.

A key Winterkorn ally withheld public support for the under-fire chief executive on Tuesday.

"I don't want to preempt the upcoming intense deliberations and will not comment on details or any consequences," Stephan Weil, head of the German state of Lower Saxony, told reporters in Hanover when asked about Winterkorn's future.

Weil, a supervisory board member representing Volkswagen's second-largest shareholder, earlier this year helped Winterkorn to see off a challenge to his leadership by long-time chairman Ferdinand Piech.

Shares in Europe's biggest carmaker plunged almost 20 percent on Monday after it admitted using software that deceived U.S. regulators measuring toxic emissions in some of its diesel cars.

The stock tumbled another 20 percent to a four-year low on Tuesday after some countries in Europe and Asia said they would launch investigations themselves.

Volkswagen said it would set aside 6.5 billion euros ($7.3 billion) in its third-quarter accounts to help cover the costs of the biggest scandal in its 78-year-history, blowing a hole in analysts' profit forecasts.

It also warned that sum could rise, adding diesel cars with so-called Type EA 189 engines built into about 11 million Volkswagen models worldwide had shown a "noticeable deviation" in emission levels between testing and road use.

Volkswagen sold 10.1 million cars in the whole of 2014.

The U.S. Environmental Protection Agency (EPA) said on Friday Volkswagen could face penalties of up to $18 billion for cheating emissions tests. The carmaker also faces lawsuits and damage to its reputation that could hit sales, while media reports have said the U.S. Department of Justice has opened a criminal inquiry into the matter.

The crisis has sent shockwaves through Germany, with Chancellor Angela Merkel calling for "complete transparency" from a company long seen as a beacon of the country's engineering excellence, and newspapers putting the blame squarely on Winterkorn.

The 68-year-old was due to have his contract extended at a supervisory board meeting on Friday, but is now facing questions over why the scandal wasn't averted.

Volkswagen, which for several years has been airing U.S. TV commercials lauding its "clean diesel" cars, was challenged by authorities as far back as 2014 over tests showing emissions exceeded California state and U.S. federal limits.

The company attributed the excess emissions to "various technical issues" and "unexpected" real-world conditions.

It wasn't until the EPA and the California Air Resources Board threatened to withhold certification for its 2016 diesel models that Volkswagen in early September admitted its

wrongdoing.

"Winterkorn either knew of proceedings in the U.S. or it was not reported to him," Evercore ISI analyst Arndt Ellinghorst said. "In the first instance, he must step down immediately. In the second, one needs to ask why such a far-reaching violation was not reported to the top and then things will get tough too."

Porsche's Mueller was promoted to Volkswagen's executive board on March 1 and was previously its head product strategist. As a management board member of family-owned Porsche SE, he is also close to the Porsche-Piech clan that has a controlling shareholding in Volkswagen.

"TOTALLY SCREWED UP"

Winterkorn has built Volkswagen into a global powerhouse since he took the helm in 2007, with brands ranging from budget Seats and Skodas to premium Audis and top-end Porsches and Lamborghinis.

But he has also faced criticism for a centralized management style which some analysts say has hampered the company's efforts to address long-standing underperformance in North America.

Workers in Wolfsburg, where Volkswagen employs over 50,000 people, were dismayed by the damage to the company's image. "If Winterkorn knew of the manipulation, then he must go," said one staffer who works at the plant's human resources department.

LA Times:
http://www.latimes.com/business/autos/la-fi-vw-subsidies-20150922-story.html

U.S. taxpayers duped into shelling out $51 million in green subsidies for 'clean' VW vehicles
By JERRY HIRSCH

The federal government paid out as much as $51 million in green car subsidies for Volkswagen diesel vehicles based on falsified pollution test results, according to a Times analysis of the federal incentives.

On Friday, federal and state regulators said the German automaker used software in 482,000

of its diesel vehicles since the 2009 model year to cheat on U.S. emissions tests. Environmental Protection Agency officials said Monday that the U.S. Department of Justice is also investigating.

The Times analysis matched Internal Revenue Service data with Volkswagen sales figures to determine the value of subsidies VW diesel buyers were eligible to collect in 2009, the first and only year the vehicles qualified. The $1,300 tax credit would have been available to buyers of about 39,500 Jetta and Jetta Sportwagen models that sold that year, according to Motor Intelligence, an industry research firm.

"It is really unfortunate," said Luke Tonachel, director of clean vehicles and fuels project at the Natural Resources Defense Council. "The government has been effective to help advance clean technologies, but it is a waste of taxpayer dollars when they aren't actually helping to clean the environment."

He said regulators should factor in the $51 million in subsidies when determining penalties for Volkswagen's Clean Air Act violations.

Such green car incentives have also gone to buyers of hybrid, electric and hydrogen fuel cell cars. But the EPA does not track aggregate figures for incentives paid out to buyers of specific models or brands.

The Volkswagen diesels qualified for the federal incentives in the same year the automaker first installed the software trick it used to cheat on emissions tests. The so-called defeat device employed an algorithm that automatically detects when the vehicle is undergoing pollution tests and changes the way the engine performs.

The algorithm senses whether the car is in a testing environment by analyzing a variety of data — steering position, speed, duration of engine operation and barometric pressure.

Away from the laboratory, during everyday driving, the cars emit up to 40 times the legally allowed amount of nitrogen oxide, environmental officials said.

The Environmental Protection Agency and the California Air Resources Board discovered the software. The EPA said Monday it will coordinate with federal prosecutors on further enforcement and penalties.

How Volkswagen cheated on emissions rules
Autos editor Brian Thevenot explains how Volkswagen used a software trick to hide illegal pollution levels in half a million diesel cars.

"Determinations regarding potential penalties and other remedies will be assessed as part of the investigation EPA has opened in conjunction with the U.S. Department of Justice," said EPA spokeswoman Liz Purchia.

The Justice Department has lately taken on a leading role in major investigations of

automakers, usually leveraging the threat of criminal charges to exact huge fines.

Last week, General Motors agreed to pay a $900-million fine to settle an investigation into why it did not promptly recall cars with a defective ignition switch that has led to crashes causing 124 deaths. Last year Toyota signed a $1.2-billion settlement and admitted to deceiving regulators about deadly safety defects that allegedly caused unintended sudden-acceleration incidents.

No individuals were charged in the GM and Toyota probes.

"This might be the perfect case for Department of Justice to come down on the criminal side against individuals and not just the company," said Carl Tobias, a University of Richmond law professor. "Someone had to do the computer programming. Someone had to OK this, and all in what is known as an autocratic, top-down company."

The German automaker admitted installing the software after it was confronted by regulators. In a statement Sunday, VW Chief Executive Martin Winterkorn said, "I personally am deeply sorry that we have broken the trust of our customers and the public."

Winterkorn said the automaker "will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly and completely establish all of the facts of this case."

He said VW has also ordered an external investigation into the matter, pledging to "do everything necessary in order to reverse the damage this has caused."

Volkswagen declined to comment on the Times analysis of its revenue from the federal Alternative Motor Vehicle Credit.

Volkswagen shares fell $33.89, or 18.5%, to close Monday at $149.68.

See the most-read stories this hour >>
This was the second time Volkswagen has been charged with using devices to evade U.S. emission-control rules.

In 1974, the automaker paid a $120,000 fine to settle EPA charges that it gamed pollution control systems in four models by changing carburetor settings and shutting off an emissions-control system at low temperatures. VW didn't admit guilt but pledged management changes to ensure future compliance with EPA regulations.

This time the monetary damage could be much greater.

The automaker will have to recall all the vehicles and modify the emissions systems at its own expense, regulators said. Additionally it could face a fine of as much as $18 billion, or $37,500 per car. And for now it has suspended sales of thousands of new and used diesel models sitting on dealer lots — cars that are depreciating rapidly while the automaker

develops a fix for the emissions system.

The affected diesel models are Jetta (model years 2009-15), Beetle (2009-15), Audi A3 (2009-15), Golf (2009-15) and Passat (2012-15).

Volkswagen also will face civil lawsuits on two fronts, including consumer fraud cases and class-action litigation for what is called a "diminished value" lawsuit. The vehicles are likely to lose some of their resale value because of the problem.

The Volkswagen case breaks new ground for how corporations can make "end runs" around legal requirements, said Ryan Calo, a University of Washington professor and expert in robotics and autonomous systems law and policy.

A company, for example, might learn of an inspection at a construction site and then make sure that workers wear helmets or it might clean a food plant thoroughly before a scheduled review even if it doesn't operate that way all the time.

"But this is encoded," Calo said. "I bet that it happens elsewhere but it is rare we detect it because we typically don't go through the code. There could be many examples in everyday things."

The VW issue demonstrates why regulators need more technical expertise, including a federal robotics commission, he said.

"We need experts in a centralized place whether the issues are drones, driverless cars or things like the VW example," Calo said.

EPA is 'Upping its Game' After Volkswagen Allegations
Top administrator is pleased with auto maker's 'aggressive stance' on tackling problem
By JEFFREY SPARSHOTT
Sept. 22, 2015 9:42 a.m. ET

WASHINGTON—The top official at the Environmental Protection Agency said the agency is "upping its game" in the search for possible violations of U.S. pollution rules following allegations that Volkswagen AG circumvented emissions standards.

"We are not going to sit around and worry about whether others have it, we are going to find it," Gina McCarthy said at a Wall Street Journal breakfast Tuesday. "Right now, we are upping our game in terms of going out and doing work to take a look at what we need to do with other vehicles."

The EPA last week accused Volkswagen of dodging air-pollution rules on nearly half a million cars sold in the U.S. The German company has since halted American sales of the diesel-powered cars at issue and apologized for violating customers' trust.

Volkswagen allegedly used software, dubbed a "defeat device," in the cars to make diesel-powered engines appear to have lower levels of emissions than they actually did. About 482,000 Volkswagen diesel-powered cars sold in the U.S. since 2008 were affected.

Ms. McCarthy said the alleged violation was difficult to detect, but she is "pleased Volkswagen is taking such an aggressive stance on admitting the problem and attacking it."

"I think we have to be concerned whether there are other defeat devices out there that we have not been able to detect," she said. But the auto industry is well aware of the pollution rules and has been working to comply.

"I think it will be very difficult for Volkswagen at this point to be looked at as nothing other than an outlier," Ms. McCarthy said.

Detroit Free Press:
http://www.freep.com/story/news/2015/09/21/us-house-panel-hold-hearing-vw/72583066/

Congress to hold hearing on VW air emissions violation
Todd Spangler and Nathan Bomey, Detroit Free Press and USA Today 8:15 p.m. EDT September 21, 2015

WASHINGTON — Congressional investigators will hold a hearing in the coming weeks to take testimony on allegations raised by the U.S. Environmental Protection Agency that Volkswagen sold hundreds of thousands of diesel-powered vehicles with software to get around air emission limits.

U.S. Rep. Fred Upton, who chairs the House Energy and Commerce Committee, said Monday that the committee's Oversight and Investigations Subcommittee will look into the EPA's allegations, which were first raised Friday. VW's stock value plunged Monday in the aftermath of the revelations, which could affect some 500,000 vehicles and potentially result in fines totaling as much as $18 billion.

Volkswagen's CEO said he was "deeply sorry" for violating U.S. emissions standards and on Sunday ordered an external investigation, two days after the EPA accused the automaker of purposefully manipulating emissions tests for almost 500,000 vehicles.

The German automaker ordered its U.S. dealerships to stop selling cars impacted by the probe until its engineers can deliver a fix.

A date was not set for the congressional hearing but Energy and Commerce staff said it would come within the next several weeks.

“Strong emissions standards are in place for the benefit of public health," Upton, R-St. Joseph, and subcommittee Chairman Tim Murphy, R-Pa., said in a joint statement. “We will follow the facts. We are ... concerned that auto consumers may have been deceived — that what they were purchasing did not come as advertised."

As the Free Press reported Friday, the EPA and the state of California accused VW of violating the Clean Air Act by using software in some 482,000 diesel-powered vehicles that could detect when the car was undergoing official emissions testing and turn full emissions controls on only during the test. The effectiveness of pollution control equipment was reduced otherwise.

EPA's violation notice covered model year 2009-15 Jettas, Beetles, Audi A3s and Golfs and model year 2014-15 Passats.

As a result, Volkswagen had a hand in potentially exposing people to harmful pollutants at levels 40 times the acceptable standard and that could exacerbate respiratory conditions such as asthma, the EPA charges.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Martin Winterkorn, Volkswagen's CEO, said in a statement. "We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly and completely establish all of the facts of this case."

"We do not and will not tolerate violations of any kind of our internal rules or of the law," Winterkorn said. The company's board takes the allegations "very seriously," he said.

The violations could expose Volkswagen — the world's largest vehicle manufacturer through the first six months of 2015 — to up to $18 billion in federal fines if the EPA assesses the maximum possible penalty of $37,500 per vehicle.

The violations could invite charges of false marketing by regulators, a vehicle recall and payment to car owners, either voluntarily or through lawsuits. Volkswagen advertised the cars under the "Clean Diesel" moniker.

The state of California is investigating the emissions violations.

The EPA accused the German automaker of adopting what it called a "defeat device" to trick U.S. regulators into believing its cars met Clean Air Act standards for nitrogen oxides. Volkswagen admitted to investigators it had installed the defeat device, the EPA said.

Volkswagen told dealers they cannot sell the 4-cylinder diesel versions of those cars until a fix is available, Volkswagen spokesman Mario Guerreiro said Sunday.

The sales halt could put a significant dent in the company's September sales performance. About 20% of Volkswagen's vehicle sales are diesel engines, said AutoPacific analyst Dave Sullivan.

"It totally goes against all of the marketing they have had of a clean diesel," Sullivan said of the violations. "That's one of the biggest selling points for Volkswagen."

"The trust of our customers and the public is and continues to be our most important asset," Winterkorn said Sunday. "We at Volkswagen will do everything that must be done in order to re-establish the trust that so many people have placed in us, and we will do everything necessary in order to reverse the damage this has caused. This matter has first priority for me, personally, and for our entire Board of Management."

Volkswagen owners should be nervous about emissions scandal, experts say
Becky Yerak and Gregory Karp

Volkswagen hit with class-action suit over emissions cheating.
Automobile recalls, even huge, highly publicized ones, typically don't hurt new or used car sales, but the Volkswagen scandal involving tricking emissions testers is different and could be cause for worry among VW diesel vehicle owners, experts say.

At least one class-action lawsuit has already been filed on behalf of Volkswagen and Audi owners. It claims fraud and breach of contract, citing the "diminished value" of the nearly 500,000 recalled diesel vehicles, which usually sell for a premium price over their gasoline counterparts. Specifically, after recalled Volkswagen diesels are fixed, the cars might have degraded horsepower and fuel efficiency, the suit says.

The EPA says Volkswagen violated the federal Clean Air Act by installing "defeat devices" — software programmed to switch engines to a cleaner mode during official emissions testing. The software then switches off again, enabling cars to emit as much as 40 times the legal limit of pollutants during normal driving.

Volkswagen marketed the diesel-powered cars as being better for the environment. The affected diesel cars, according to the EPA's letter to Volkswagen on Friday, include: Jetta, 2009 to 2015; Jetta SportWagen TDI, 2009 to 2014; Beetle, 2012 to 2015; Beetle Convertible, 2013 to 2015; Audi A3, 2010 to 2015; Golf, 2010 to 2015; Golf SportWagen TDI, 2015; and Passat, 2012 to 2015.

Consumer Reports called the Volkswagen scandal "outrageous" and a violation of law.

"Volkswagen was ripping off the consumer and hurting the environment at the same time," said Ellen Bloom, senior director of federal policy for Consumers Union, the policy and advocacy arm of Consumer Reports.

The EPA has ordered VW to fix the cars at its own expense but said car owners do not need to take any immediate action. The EPA insisted that the violations do not pose any safety hazard and said cars on the road remain legal to drive. Volkswagen has ordered a stop to sales of new and used TDI cars in stock.

The EPA said, however, that the cars pose a threat to public health. The agency said the carmaker could be fined more than $18 billion.

The automaker is also part of a criminal probe by the U.S. Justice Department, unnamed sources told The Associated Press and Bloomberg News.

In the Chicago region, Volkswagen dealerships were not responding to inquiries Monday, except one that said it hadn't heard from any consumers about the issue and expressed confidence the problem would be taken care of.

For consumers, whether diesel Volkswagens from seven model years will really have less value is an open question.

During recent high-profile recalls by GM, Toyota and Honda, there has been very little, if any, impact on sales, said officials from Kelley Blue Book, Black Book and Edmunds.

"With so many recalls in the news, they easily become white noise for a lot of consumers, and they don't appear to have much of an influence on shopping decisions," according to Edmunds.com.

Even when there's intense media coverage, the impact on resale value is "fleeting," as with the Toyota recall for accelerators that would stick, said Eric Ibara, a senior analyst with Kelley Blue Book. "It lasted for maybe six or eight months, and their resale values popped back to where they normally were.

Still, the Volkswagen recall is different.

First, it doesn't involve a safety issue but more a breach of public trust. "The impact on that could be longer-lasting," Ibara said. "Our concern is their image is tarnished ... I imagine if you own a Volkswagen, you're reading the coverage of what they've done."

Indeed, when a car is recalled for a safety reason, the recall could actually improve goodwill with the customer, said Anil Goyal, vice president of Automotive Valuation and Analytics for Black Book.

Another concern for current owners is how the resale values will react when Volkswagen eventually restarts selling the diesel models now sitting idle on lots after it stopped selling. "If they show up with higher incentive levels, that certainly impacts the used-car values," Ibara said.

In other words, if VW chooses to get rid of that inventory by offering great incentives and significantly lowering diesel car prices, demand for used cars would drop along with their prices.

Volkswagen offers some of the least expensive diesel models and in recent years had been a market leader in that segment of the vehicle market, said John Voelcker, editor of GreenCarReports.com. "Diesels in this country have mostly been confined to trucks," Voelcker said. "VW was the only volume maker of diesel cars."

According to Edmunds, VW and Audi account for 17 of 44 vehicle models that offer diesel engines, or 39 percent.

Diesel vehicles fetch a premium price both in the new and used markets. The premium price paid by new-car buyers for the diesel version of the recalled cars varies from $1,000 to almost $7,000, according to list prices.

In a quick analysis by Swapalease.com, a 3-year-old base model Volkswagen Golf using gasoline sold for 51 percent of its original value, while a diesel sold for 57 percent, said Scot Hall, executive vice president of operations for Swapalease.com. "That's a significant difference," he said.

It's an open question whether the VW diesels, which have TDI as part of the name for turbocharged direct injection, will retain the premium over their gasoline counterparts, Ibara said. "It would not surprise me if they drop a little bit, but I do not expect the premium to entirely disappear."

What fix Volkswagen will employ is unclear, whether it's a software solution or some physical repair or retrofit. It may just restate the fuel economy to be lower on diesels — maybe 3 to 5 mpg — and then be faced with offering some compensation to owners, Ibara said.

So far, it's difficult to say for sure that a fix would hurt the vehicle's fuel mileage, performance or reliability. But some current owners are expecting that, Hall said.

Hall said there's talk that some Volkswagen owners would avoid the fix because they prefer more power, better performance and greater fuel economy and care less about the emissions.

Consumer Reports said that, as a result of the scandal, it has suspended its "recommended" rating of two VW vehicles, the Jetta diesel and Passat diesel, until it can retest the cars with

the recall repair performed. It said it will also assess whether the repair hurts performance or fuel economy.

The potential downgrade in performance was also mentioned in the class-action lawsuit,

filed on behalf of David Fiol, a California resident and 2012 VW Jetta SportWagen TDI owner. He seeks class-action status both nationally and in California, for unspecified punitive damages and legal fees, among other things.

Fiol, in his lawsuit, mentions "future additional fuel costs" and the "diminished value" of his vehicle, despite the recall.

Volkswagen won't be able to make the vehicles "comply with emissions standards without substantially degrading their performance characteristics, including their horsepower and their efficiency," the lawsuit said. "As a result, even if Volkswagen is able to make" plaintiffs' vehicles EPA compliant, the owners "will nonetheless suffer actual harm and damages because their vehicles will no longer perform as they did when purchased and as advertised."

Volkswagen didn't immediately respond to a request for comment about the lawsuit, filed last Friday by Seattle law firm Hagens Berman Sobol Shapiro in a U.S. District Court in the Northern District of California.

In Illinois, diesel vehicles like the VWs in question don't require emissions inspections like gasoline models, so the flap won't affect owners in that way, according to a spokeswoman for the Illinois Environmental Protection Agency.

It Took E.P.A. Pressure to Get VW to Admit Fault
By BILL VLASIC and AARON M. KESSLER SEPT. 21, 2015

Volkswagen executives told environmental regulators for more than a year that discrepancies between pollution tests on its diesel cars and the starkly higher levels out on the road were a technical error, not a deliberate attempt to deceive Washington officials.

But this month, the executives made a startling admission: The diesel vehicles it sold in the United States used software meant to cheat on the tests.

VW made the admission only when the Environmental Protection Agency took the extraordinary action of threatening to withhold approval for the company's 2016 Volkswagen and Audi diesel models, according to letters sent to company officials by the E.P.A. and California regulators.

Since that deception became public on Friday, Volkswagen has scrambled to conduct damage control. The chief executive apologized and the company said it would stop selling diesel-powered cars from the 2015 and 2016 model years.

All this was possible because environmental regulators had tools and powers at their disposal that another area of enforcement — auto safety regulation — does not have, despite the efforts of lawmakers, consumer advocates and, more recently, auto safety regulators themselves. Often, the auto industry has beaten back more stringent laws.

The National Highway Traffic Safety Administration, for example, can impose a maximum penalty of $35 million on an automaker that flouts safety regulations — a relatively low sum for a company like General Motors, which last year paid such a fine for a defect that has now been linked to at least 124 deaths.

By contrast, under the Clean Air Act, Volkswagen, the world's largest automaker, could be fined as much as $37,500 for each recalled vehicle, for a possible total penalty of as much as $18 billion.

"The Clean Air Act statutory scheme gives E.P.A. more power and flexibility to move more quickly than N.H.T.S.A.," said Carl Tobias, a law professor at the University of Richmond, who has studied the government's response to auto safety issues. "E.P.A. also seems more tough-minded and savvy about how to be effective in this arena."

Still, the time it takes to investigate auto companies is often extensive, and getting the facts can be a challenge. "Even E.P.A. took a year to finally crack this case open," he said.

Beyond the E.P.A., the government has other tools at its disposal when it comes to enforcing environmental regulation.

As G.M. did, Volkswagen now faces a criminal investigation by the Justice Department, according to a person briefed on the inquiry. It is being conducted, though, by the department's Environment and Natural Resources Division, which is devoted to violations of environmental law. "Nearly one-half of the division's lawyers bring cases against those who violate the nation's civil and criminal pollution-control laws," the department's website says.

And on Monday, a subcommittee of the House Energy and Commerce Committee said it would hold a hearing on the issue.

It's only part of the pressure being applied to Volkswagen. An official with the Environmental Protection Agency said that discussions are continuing with Volkswagen, as the company grapples with how to handle a recall of the affected vehicles.

"We still have many questions for the company," said Christopher Grundler, head of the agency's transportation office. "It's the responsibility of Volkswagen and Audi to prepare a remedy for these vehicles."

There is no timetable for Volkswagen to submit a comprehensive plan to recall and fix the affected vehicles. But government officials are urging the company to take action quickly — both on developing a fix for the cars and starting a campaign to educate consumers on the problem.

"This does not happen immediately," Mr. Grundler said. "And we've been trying to be clear with the consumers that their vehicles are safe and they don't have to do anything right now." The assessment of fines for the violations will also not happen immediately. "That is down the road," he said.

"But we feel a sense of urgency to address the emissions of these vehicles that are already on the road."

A Volkswagen spokesman, John Schilling, said the automaker was "committed to fixing this issue as soon as possible" and to developing "a remedy that meets emissions standards and satisfies our loyal and valued customers."

Even with the looming punishment, the company almost got away with it. In fact, it most likely would have if not for a strange twist of fate and the curiosity of several auto researchers.

Two years ago, the International Council on Clean Transportation, a nonprofit environmental group staffed by a number of former E.P.A. officials, had been testing the real-world performance of so-called clean diesel cars in Europe, and were less than impressed with the emissions results.

The group decided it would test diesel-powered cars in the United States, where regulations were much more strict, as a way of almost shaming the European automakers to tighten their compliance. The group fully expected the American cars to do well, and run cleaner than their counterparts across the pond.

What they could not have foreseen was that they would stumble onto one of the biggest frauds in recent automotive history.

Further, on the campus of West Virginia University, a group of emissions researchers who mainly dealt with heavy trucks noticed an unusual posting by the transportation council, which was looking for a partner to test diesel-powered cars.

"No one had done that before in the U.S.," said Arvind Thiruvengadam, a professor at the university. "It sounded very interesting, to test light-duty diesel vehicles in real-world conditions. We looked around at each other said, 'Let's do it.' "

The university's team bid on the project and got the contract. Mr. Thiruvengadam and his colleagues never envisioned where it would lead. "We certainly didn't have an aim of catching a manufacturer cheating," he said. "It didn't even cross our minds."

The study also did not target Volkswagen specifically. It was something of a fluke, he said, that two out of three diesel vehicles bought for the testing were VWs.

It did not take long for suspicions to set in. The West Virginia researchers were well-versed in diesel performance on real roads, and had certain expectations for how the test cars should ebb and flow in their emissions. But the two Volkswagens behaved strangely.

"If you're idling in traffic for three hours in L.A. traffic, we know a car is not in its sweet spot for good emissions results," Mr. Thiruvengadam said. "But when you're going at highway speed at 70 miles an hour, everything should really work properly. The emissions should come down. But the Volkswagens didn't come down."

Even then, however, it is difficult for most researchers to be sure exactly what is going on. There are so many factors involved in real-world driving — speed, temperature, topography, braking habits. It is not unheard-of for cars to perform much differently in on-the-road tests than one expected.

But this time there was a key difference: The California Air Resources Board heard about the groups' tests and signed on to participate. The regulators tested the same vehicles in their specially equipped lab used to judge cars' compliance with state emissions standards. That gave the project what most studies lacked: a baseline.

"That broke loose everything," Mr. Thiruvengadam said.

In the lab, the two VWs performed flawlessly. But when they were taken out on the roads in California, they were belching out levels of nitrogen oxide that were 30 to 40 times higher than the regulatory standards. Even the heavy-duty trucks the researchers had tested had never performed that poorly by comparison.

"It just didn't make sense," said John German, one of the leaders on the project at the transportation council. "That was the real red flag for us."

Volkswagen Credit Spreads Soar After EPA Charges Co. With Evading Pollution Controls
John Atkins, CONTRIBUTOR

Credit spreads referencing German automaker Volkswagen widened sharply today after the U.S. Environmental Protection Agency on Friday charged the company with evading government pollution controls through software designed to allow diesel models to meet clean-air standards, but only during official emissions testing. The government demand for recalls affects roughly 500,000 vehicles.

Volkswagen five-year CDS costs increased 80% today, rising 60 bps to the 135 bps area, or a high since 2012, trade data show. The 2.45% notes due Nov. 20, 2019 issued by subsidiary Volkswagen Group of America Finance last November, at T+85, changed hands today as much as 77 bps wider on the session, reaching at G-spread equivalents as wide as T+180, according to MarketAxess.

Credit analysts today noted the significant potential risks to VW's credit standing and reputation. "VW's operating margins have lagged peers (BMW, Daimler) for some time, and the automaker has cited encouraging U.S. vehicle sales in the context of its 2015 revenue and profit outlook," stated FTN Financial senior credit strategist Benjamin Millard in a credit note.

While it acknowledged uncertainties regarding the impact of the scandal on Volkswagen's brand image and reputation – and terming the development a "crisis" for VW – Fitch today said the scandal is unlikely to trigger an immediate downgrade of Volkswagen's A rating, even though Volkswagen reportedly faces a maximum penalty of $18 billion as well as any costs related to a recall effort.

"We believe the fine is unlikely to amount to the theoretical maximum amount of USD37,500 per car, although there have been only very few precedents of such cases and associated fines. In addition, the group's financial structure is sound and its free cash flow (FCF) generation extremely robust," Fitch stated today.

The outlooks on the respective A/A2 ratings at S&P and Moody's are currently stable, through S&P warned as recently as Sept. 7 that stricter carbon rules were fueling high capital spending demands on Europe's carmakers.

The Volkswagen Diesel Emissions Scandal, By the Numbers
Ethan Wolff-Mann @ewolffmann Sept. 21, 2015

VW is accused of faking pollution tests on a grand scale.

Last week, the EPA accused Volkswagen of deliberately falsifying tests of its diesel engine

cars so that the vehicles would pass anti-pollution standards. A massive recall of nearly half a million Volkswagen diesel cars was ordered, causing a major stir in the industry—and especially among VW owners who had been drawn to the vehicles because of the automaker's "clean diesel" claims.

Let's look at the situation by the numbers.

482,000 Diesel cars affected, which include TDI Jettas, Beetles, Golfs, and Audi A3s from 2009-15 and Passats from 2014-15.

$37,500 Fine per vehicle that the German automaker could face in the U.S.

$18 billion Possible total penalties faced by Volkswagen, and that figure doesn't include fixing the recalled cars.

40 Times over the legal limit of certain types of pollution emitted by the vehicles, including nitrogen oxide—which can cause respiratory problems.

$6,855 Premium that buyers were paying for Passat TDI cars over standard gasoline versions.

-20% The hit Volkswagen stock has taken since the scandal.

12 Number of months Volkswagen has been denying cheating on the emissions test.

2017 When Volkswagen may sell diesel cars again in the U.S., now that sales have been halted.

2.0 Liter 4-cylinder engines affected. Larger diesel engines used in SUVs don't have the software at the center of the controversy.

$0 Current resale value of affected cars in California, because the cars were sold as "non-compliant" (and therefore cannot be resold).

14.28% Of affected cars that are registered in California

23 Percentage of Volkwagens sold in August that were diesels.

Automotive News:
http://www.autonews.com/article/20150921/OEM11/150929980/vws-diesel-sales-frozen-until-compliance-is-proven-epa-official-says

VW's diesel sales frozen until compliance is proven, EPA official says
Fix must be approved before recall can begin
Chris Grundler: "It will take more work to determine what the appropriate remedy for these

vehicles is."
By Ryan Beene

WASHINGTON -- With its diesel car lineup grounded by an emissions-test cheating scandal, Volkswagen now bears the burden of proving that these vehicles comply with federal emissions standards, the EPA's top auto regulator said.

Until then, said Chris Grundler, director of the EPA's Office of Transportation Air Quality, no sales.

Meanwhile, Grundler said, the EPA and California regulators are now probing all light-duty diesel vehicles in the U.S. market from all manufacturers to check for illegal software designed to fool U.S. emissions tests.

U.S. regulators accused VW on Friday of violating the Clean Air Act by selling 482,000 diesel-powered vehicles with such illegal software. The agency said the company admitted to fitting seven model years' worth of diesel cars with the softwared -- termed a "defeat device" -- that would activate the cars' emission controls during testing, but deactivate them in real-world driving.

In order to be able to resume sales of diesels, Grundler said, VW has to engineer a fix to bring those vehicles into compliance, and receive EPA approval before a recall can commence. It's not clear yet whether that fix will consist of a change to the engine's emission control software or more substantial engineering changes to vehicle hardware, Grundler said.

According to the EPA's website, it could take up to one year to identify "corrective actions," develop a recall plan and issue recall notices. But Grundler declined to discuss a specific timetable.

"Until we gather that information and are convinced ... we're not going to go forward with the recall," Grundler said. "It will take more work to determine what the appropriate remedy for these vehicles is."

Capitol Hill
U.S. lawmakers want more answers, too.

Republican leaders of the House Energy and Commerce Committee today announced plans to hold a hearing on the VW emissions scandal in the near future. The hearing will be held before the panel's Oversight and Investigations Subcommittee, though no date has been set.

"We will follow the facts. We are also concerned that auto consumers may have been deceived – that what they were purchasing did not come as advertised," U.S. Reps. Fred Upton, R-Mich., and chairman of the Energy and Commerce Committee and Tim Murphy, R-Pa., chairman of the investigations subcommittee, said in a joint statement.

"The American people deserve answers and assurances that this will not happen again. We intend to get those answers."

Also in Washington, the White House said today it was "quite concerned" about reports it was seeing concerning VW's conduct in complying with U.S. Clean Air Act requirements.

"It's fair to say that we're quite concerned by some of the reports that we've seen about the conduct of this particular company, but ultimately this is the responsibility of the EPA to take a look at it and that's exactly what they're doing," said White House spokesman Josh Earnest.

California questions
VW will also have to convince the EPA and California's Air Resources Board that its 2016 model year diesel vehicles will comply with emissions standards and are free of any illegal software, Grundler said. Until then, the agency will continue to withhold the emission certifications needed to begin sales of those models, which are currently being withheld from dealers.

The sales suspensions are a blow to Volkswagen, which counts on diesels for more than one-fifth of the VW brand's sales volume, and has touted its "clean diesel" technology as a key differentiator in the marketplace.

"We've been working with the company for a long time trying to get answers and it wasn't until very recently that VW admitted that these vehicles contained software designed to defeat the emissions standards," Grundler said. "We want to make sure that 2016 model vehicles don't operate the same way."

Popular Mechanics:
http://www.popularmechanics.com/cars/a17430/ezra-dyer-volkswagen-diesel-controversy/

This VW Diesel Scandal Is Much Worse Than a Recall
This isn't cost-cutting. This is outright cynical deceit.
By Ezra Dyer

Most of the time, media test cars are distinguished only by a license plate that might bear a discreet "manufacturer" tag. Audi diesels, though, are a different matter. Whether a Q7 or an A3, the diesel press cars from Audi (which is part of the Volkswagen group) always bear towering "TDI Clean Diesel" decals across their flanks. I guess the theory is that when the cars are out on the road they're serving double duty as billboards, spreading the gospel about the Volkswagen group's engineering prowess.

A few years ago I bought a nasty Ford F350 diesel for an engine swap, and I parked it next to an Audi A3 and took a few shots to capture the juxtaposition: truck from the dirty diesel past, Audi harkening to the clean-burning future. That certainly looks ironic today.

If you're not up to speed on Volkswagen's shenanigans, you can catch up here. Suffice to say that it seems the A3's sanctimonious TDI Clean Diesel stickers were relevant only when the cars were actually undergoing an EPA emissions test. Out in the real world, 2.0-liter Volkswagens and Audis were as much as 40 times above the legal emissions limit for nitrogen oxides (NOx). According to the EPA, about 482,000 four-cylinder Volkswagens and Audis built since 2009 included what the agency defines as a "defeat device," which is really just software that detects an emissions test and "turns full emissions controls on only during the test." The cheater software was discovered by researchers at West Virginia University who were trying to document the cleanliness of modern diesels. Volkswagen surely wishes they hadn't bothered.

The revelation of this emissions subterfuge answers at least two questions about VW's mighty little diesel. The first concerns urea injection, which every other modern diesel uses to pass emissions tests. The urea-injection systems help to neutralize NOx emissions, but they also add weight and cost to the car, and saddle car buyers with yet another tank of liquid that must be monitored. If you run out of this diesel exhaust fluid, it's like running out of fuel—on trucks with such systems, running dry on urea triggers a severe limp-home mode with a 5 mph speed limiter. That's how seriously the EPA takes NOx.

Everyone wondered how VW met emissions standards while foregoing urea injection. As it turns out, they didn't. It wasn't magical German engineering. Just plain old fraud.

The second question concerned fuel economy. It's been widely noted that four-cylinder TDIs tend to smash their EPA fuel economy estimates in real-world driving. The last TDI Jetta SportWagen I drove was rated at 42 mpg highway, but on 60-mph two-lane roads I averaged more like 50 mpg. That's a huge difference. Did running non-compliant emissions improve fuel economy? That's possible. And if so, that raises an interesting question: When the cheater VWs emitted too much NOx, were they also emitting a lot less CO2 thanks to improved economy? Maybe the good doesn't offset the bad, but it's something to consider. You can bet that VW's lawyers will.

THE INTENTIONALITY BEHIND THE DECEIT MAKES THIS SITUATION DIFFERENT FROM EVEN A HUGE-SCALE RECALL.

So, how is Volkswagen going to fix this? Putting aside the inevitable fines, possible criminal charges, and massive public disgrace, there are half a million cars running an emissions setup that never should've left the factory. And there's no quick fix to make up for VW's lies.

All the other carmakers control diesel emissions by spraying a urea solution into the exhaust stream, where a catalyst converts it to ammonia. The ammonia breaks down NOx into nitrogen and water. If all of that sounds like it would be tough to bolt right in, you're correct. Maybe VW can meet the standards without adding equipment—say, by tweaking the engine control unit (ECU) with a different tuning. But what if that new tuning meets the emissions standards but sacrifices performance or fuel economy? Now you've got 482,000 customers on a class action lawsuit.

There's no easy way out of this, but they'd better figure something out, and pronto. Right now dealers are banned from selling 2.0-liter TDIs, which make up about a quarter of VW's U.S. sales. News of the scandal caused VW to lose about a quarter of its market value, indicating that investors understand how bad this is. There's no cheap fix nor easy settlement here.

The intentionality behind the deceit makes this situation different from even a huge-scale recall. This isn't a story about a part that was made one cent cheaper than it should've been, where a car company cut a corner to save a little cash. It's about a huge corporation eying the rulebook and deciding there's a competitive advantage in violating the Clean Air Act. Incompetence is one thing, but calculated mendacity is quite another.

It's too bad. That Golf SportWagen TDI is a punchy, fun car. It's got great fuel economy, tons of torque and a bargain price. But when something seems a little too good to be true, maybe that's because it is.

Chicago Tribune:
http://www.chicagotribune.com/business/columnists/ct-rosenthal-vw-emissions-0922-biz-20150921-column.html

VW comes clean on dark heart of its diesel cars. Can it clear the air?
Phil Rosenthal

Seems VW fought diesel wars with smoke and mirrors, mostly smoke. What the fahrvergnügen?!
Volkswagen called it clean diesel. Clean like Lance Armstrong. Clean like the Chicago River.

Seriously, what the fahrvergnügen?!

VW has admitted to the Environmental Protection Agency that hundreds of thousands of its diesel cars have been using what is literally a killer app.

The software allowed the vehicles to sail through U.S. emissions tests while reportedly spewing 10 to 40 times the level of certain pollutants as allowed in ordinary use.

It's been smoke and mirrors — mostly smoke — for the last seven model years.

We're talking about 2009, 2010, 2011, 2012, 2013, 2014 and 2015 VW Golfs, Jettas and

Beetles, along with Audi A3s, equipped four-cylinder, 2.0-liter turbodiesel engines. Oh, almost forgot the 2012-15 Passats.

That's nearly half-a-million vehicles in all, belching nitrogen oxide to preserve mileage ratings and performance no other carmaker could seem to match, thanks to emissions control systems programmed to operate only when testing protocols were detected.

So we get more smog and ozone and poisons tied to a litany of health problems, such as asthma attacks and other respiratory diseases, along with premature death. VW gets more car sales.

Score one for German engineering and systematic subterfuge, trading our health for its profits.

Apparently the EPA was first tipped to VW's plot when discrepancies showed up in independent testing. But it seems like precisely the sort of thing James Bond is told of when strapped to a nuclear missile about to launch.

The word diabolical comes to mind.

So does evil.

One pictures even C. Montgomery Burns, king of the corner-cutters on "The Simpsons," looking askance. And we don't know yet if VW is the only offender.

The auto industry isn't overburdened by high expectations, particularly in the last 12 months or so.

General Motors last week agreed to a $900 million settlement to end a criminal investigation into its failure to disclose a deadly ignition defect.

Toyota last year agreed to a $1.2 billion penalty for withholding information about its vehicles' unintended acceleration linked to other fatalities.

Takata, it's been revealed, knew of dangerous, potentially fatal defects in its airbags long before alerting federal regulators, leading to the recall of millions of Honda, Toyota, Chrysler, Subaru, GM, Mitsubishi, BMW, Mazda, Nissan and Ford vehicles.

Yet, as Automotive News noted, "Compared with other run-ins between the EPA and automakers, VW's alleged violation stands out in its brazenness."

This takes that kind of amoral corporate behavior to a whole other threat level.

VW didn't just conceal something it discovered endangering people. It created technology for the specific purpose of allowing it to benefit from endangering people.

Even if you're one of those people who somehow isn't a fan of clean-air standards, it's not a political statement to press on and try to throw authorities off the trail. It's just a crime.

Tampering with emissions control systems, under terms of the Clean Air Act, could mean a fine for VW as high as $37,500 per vehicle or roughly $18 billion, though you know what happens when you start to haggle with car guys.

But even if VW is fined and there's a mandatory recall, some drivers will be reluctant to embrace the fix because it likely will make the vehicle less effective and efficient than the one they thought they bought.

Funny we never caught wind of any of this in those slightly discomfiting VW commercials with the old ladies hitting on a salesman. Least we don't remember any mention of it.

VW pulled the ads off the air and, to the extent it could, off YouTube as word of its scandal came out, yet more proof that a carmaker can indeed move fast to protect something it actually cares about — like its bottom and bottom line.

This isn't the Olympics. It's one thing to try to keep test results from showing banned substances in one's own body, quite another to try to mask bad stuff being inflicted on others.

Cough.

This goes beyond the venality of one corporation to whether there's any confidence left in diesel cars and credibility in the entire auto industry. Even if this is as far as it goes, it will take quite a while to clear the air.

VW recently surpassed Toyota to become the world's largest carmaker, an achievement now eclipsed by the suspicion that there is nothing it wouldn't do.

Bloomberg (via Australian Financial Review):
http://www.afr.com/news/world/volkswagen-faces-us-criminal-probe-on-emissions-20150921-gjrtss

Volkswagen faces US criminal probe on emissions

The US Justice Department is conducting a criminal investigation of Volkswagen's admission to cheating on federal air pollution tests, according to two US officials familiar

with the inquiry.

Volkswagen said last week it's cooperating with regulators probing gaps between emissions on the road and lab tests on some diesel models, affecting more than half a million cars. The US officials described the inquiry on condition of anonymity because it's a continuing investigation.

The Wolfsburg, Germany-based automaker plunged as much as 23 per cent Monday to 125.40 euros in Frankfurt, wiping out about 15.6 billion euros ($US17.6 billion) in market value. The stock closed at 132.2 euros, its lowest in more than three years.

Volkswagen's admission is putting pressure on Chief Executive Officer Martin Winterkorn to repair the reputation of the world's biggest carmaker. Winterkorn, whose contract renewal is scheduled for a supervisory board vote on Friday, now faces a serious challenge to his leadership, said Arndt Ellinghorst, a London-based analyst for Evercore ISI.

"This latest saga may help catalyze further management changes at VW," Ellinghorst wrote in a note Monday.

Justice Department spokesman Wyn Hornbuckle declined to comment.

Criminal inquiries can take months or years and lead to charges against individuals and companies. They can also result in fines and deferred-prosecution agreements, such as the one recently struck with General Motors Co., to spur companies into improving their behaviour and addressing problems revealed during the investigations.

Volkswagen admitted on September 18 to fitting some of its US diesel vehicles with software that turns on full pollution controls only when the car is undergoing official emissions testing, the Environmental Protection Agency said Friday. Affected are diesel versions of the VW Jetta, Golf, Beetle and Passat and the Audi A3.

During normal driving, the cars with the software -- known as a "defeat device" -- would pollute 10 times to 40 times the legal limits, the EPA estimated. The discrepancy emerged after the International Council on Clean Transportation commissioned real-world emissions tests of diesel vehicles including a Jetta and Passat, then compared them to lab results.

VW said it's cooperating with regulators probing gaps between emissions on the road and lab tests on some diesel models. According to the EPA, the company insisted for a year that discrepancies were mere technical glitches.

Winterkorn, who has led VW since 2007, was forced to halt sales of the cars on Sunday and issue a public apology, saying he's "deeply sorry" for breaking the public's trust and that VW would do "everything necessary in order to reverse the damage this has caused."

The violations could result in as much as $US18 billion in fines, based on the cost per violation and the number of cars.

The US accusations are "grave" and must be clarified swiftly, said Stephan Weil, prime minister of the German state of Lower Saxony, which owns 20 percent of Volkswagen's voting shares. "Possible consequences can be decided after that."

The European Commission also said it's taking VW's cheating seriously and is in contact with US regulators and the company about details of the case.

The Guardian:
http://www.theguardian.com/business/2015/sep/21/volkswagen-emissions-scandal-sends-shares-in-global-carmakers-reeling

Volkswagen emissions scandal could snare other companies, whistleblower claims
Billions wiped off value of industry heavyweights amid concerns that manipulation of air pollution data could be 'very widespread'
Joanna Walters Graham Ruddick and Sean Farrell

The emissions-fixing scandal that has engulfed Volkswagen in the US could extend to other companies and countries, one of the officials involved in uncovering the alleged behavior told the Guardian on Monday.

Billions of pounds have been wiped off the value of global carmakers amid growing concerns that emissions tests may have been rigged across the industry.

"We need to ask the question, is this happening in other countries and is this happening at other manufacturers? Some part of our reaction is not even understanding what has happened exactly," said John German, one of the two co-leads on the US team of the International Council for Clean Transportation (ICCT), the European-based NGO that raised the alarm.

Shares in Volkswagen fell by almost a fifth after the world's second biggest carmaker issued a public apology in response to US allegations that it used a "defeat device" to falsify emissions data.

The US Justice Department is conducting a criminal investigation of Volkswagen admission, according to Bloomberg, which cited two officials familiar with the inquiry.

The company could face a fine of up to $18bn (£11.6bn), criminal charges for its executives, and legal action from customer and shareholders. The US law firm Hagens Berman has already launched a class-action law suit on behalf of customers who bought the affected cars.

VW shares fell by 19% in Frankfurt, wiping almost €15bn (£10.8bn) off its value. Shares in Renault, Volkswagen's French rival, also dropped by 4%, while Peugeot was down 2.5%, Nissan 2.5% and BMW 1.5% amid concerns they could be caught up in investigations.

The US Environmental Protection Agency said on Friday that VW had installed illegal software to cheat emission tests, allowing its diesel cars to produce up to 40 times more pollution than allowed. The US government ordered VW to recall 482,000 VW and Audi cars produced since 2009.

In response, Martin Winterkorn, chief executive of VW, said on Sunday he was "deeply sorry" for breaking the trust of the public and ordered an external investigation.

German tipped off regulators at the California Air Resources Board (Carb) and the US Environmental Protection Agency (EPA) after conducting tests that showed major discrepancies in the amount of toxic emissions some VW cars were pumping out compared with the legal limits.

Max Warburton, an analyst at the financial research group Bernstein, said: "There is no way to put an optimistic spin on this – this is really serious."

A British expert in low-emission vehicles claimed the manipulation of air pollution data could be "very widespread" and that tests in Europe are "much more open to this sort of abuse".

Greg Archer, a former government adviser and head of clean vehicles at the respected Transport & Environment thinktank, said: "I am not surprised. There has been a lot of anecdotal evidence about carmakers using these 'defeat devices'. All credit to the US's EPA for investigating and finding the truth."

Archer, the former managing director of the UK's Low Carbon Vehicle Partnership and non-executive director for the government's Renewable Fuels Agency, said the scandal could spread into petrol cars and CO2 levels. "It is probably not limited to diesel and not limited to emissions," he added.

The "defeat devices" are thought to work by injecting more urea – an exhaust fluid – into the car when it is being tested. This limits nitrogen oxide emissions. The car detects it is being tested because devices such as the anti-collision systems have to be turned off when it is in the laboratory. The extra urea is not injected into the car when it is on the road because it would quickly run out.

Archer claims European tests are more open to abuse because they are conducted before the car goes into mass production and by companies that have been paid by the carmakers. These testing companies have been verified by regulators in each country, such as the Vehicle Certification Agency, but in the US the tests are conducted by an independent body.

Industry leaders in Britain claimed there was "no evidence" that manufacturers are cheating the system in Europe but admitted it needs to be reformed.

Mike Hawes, chief executive of the Society of Motor Manufacturers and Traders, the industry trade body, said: "The EU operates a fundamentally different system to the US – with all European tests performed in strict conditions as required by EU law and witnessed by a government-appointed independent approval agency. There is no evidence that manufacturers cheat the cycle.

"The industry acknowledges, however, that the current test method is outdated and is seeking agreement from the European Commission for a new emissions test that embraces new testing technologies and is more representative of on-road conditions."

The US allegations involve a series of diesel cars produced by VW and the brands it owns, such as Audi. These include the Audi A3, VW Jetta, Beetle, Golf and Passat models. VW has halted sales of these models.

Jochen Flasbarth, a senior environment official in the German government, accused Volkswagen of "blatant consumer deception" over the scandal. The country's economy minister, Sigmar Gabriel, also warned it could damage the reputation of the country's vital automotive industry.

"That this is a bad case, I think is clear," Gabriel said. "You will understand that we are worried that the justifiably excellent reputation of the German car industry and in particular that of Volkswagen suffers." The German government has launched its own investigation into VW and held talks with executives.

The scandal puts the future of Volkswagen chief Winterkorn in serious doubt. Earlier this year he won an internal power struggle with Ferdinand Piëch, who stepped down as chairman. The board of the company is due to meet on Friday to discuss extending Winterkorn's contract.

Winterkorn has been at the helm of VW since 2007 and has been directly responsible for research and development since then.

Guido Reinking, a German automotive analyst, told German television station n-tv: "It's almost impossible to imagine that he didn't know about this special way of programming the engine."

David Bailey, professor of industrial strategy at Aston University in Birmingham, said: "If it is the case that they have been trying to hoodwink regulators, it's a really dumb thing to do. Regulators will look at this more closely now. There has been growing concern about diesel cars and nitrous oxide emissions. The industry has been trying to make the case that the latest regulations largely deal with that issue but regulators will now look more closely at whether they have."

In the wake of the scandal two senior VW executives cancelled a planned appearance at a media event in New York with rock star Lenny Kravitz scheduled for Monday evening.

Herbert Diess, chairman of the VW brand's management board, and Heinz-Jakob Neusser, VW's board member in charge of technical development, had planned to attend the event to introduce the latest version of the Passat mid-size sedan.
The chief executive of VW's US arm, Michael Horn, was still due to attend the event. He is expected to provide a statement about the situation.

Volkswagen Is Now The Target Of A Criminal Investigation: Report
Michael Ballaban

In a move that seemed like an inevitability at this point, the United States Department of Justice is said to have opened a criminal investigation into Volkswagen's admission to cheating on diesel emissions tests, a report from Bloomberg said.

While we had heard rumblings of a possible criminal probe earlier, this news appears to confirm that VW is in fact the subject of an investigation that could lead to prosecutions.

It's way too early to tell whether or not any individuals will personally be held criminally liable for the company's deceptions, but it's not out of the realm of possibility. We haven't seen a case in a long time where a company has admitted intentionally circumventing the law, rather than just a plea of massive institutional incompetence, so it's anyone's guess as to what will happen.

The U.S. Environmental Protection Agency has said that the company can be held responsible for up to $18 billion in fines.

Business Insider:
http://www.businessinsider.com/the-us-government-is-launching-a-criminal-investigation-into-vws-falsified-emissions-figures-2015-9

The US government is launching a criminal investigation into VW's falsified emissions figures
Benjamin Zhang

The US Department of Justice has launched a criminal probe into Volkswagen's

falsification of emissions data, Bloomberg news is reporting.

Last week, the Environmental Protection Agency accused the automaker of falsifying the data using secret software in nearly 500,000 cars.

According to Bloomberg's Del Quentin Wilber, two government officials close to the situation say the Justice Department is conducting a criminal investigation into the allegations.

Last week, the EPA accused VW of using the hidden software — called a "defeat device" — to dodge clean-air standard during emissions testing.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," assistant administrator for the Office of Enforcement and Compliance Assurance Cynthia Giles said in a statement on Friday.

“Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters.”

The EPA alleges that VW installed software that detects when the car is undergoing emissions testing, at which point the software would turn on all of the car's emissions control systems. But the EPA claims that the software greatly reduces the cars' pollution-control systems during normal driving conditions.

"This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the standard," the EPA said in a statement.

Across the Atlantic, the German government is also taking a look at Volkswagen's emissions data. A spokesperson for the country's Motor Vehicle Agency told the Wall Street Journal that is has asked automakers to provide accurate emissions information to "determine whether similar instances of manipulation have taken place in Germany or Europe," However, there is no word of any official investigation on the part of the German government.

Over the weekend, VW CEO Martin Winterkorn issued the following statement:

The U.S. Environmental Protection Agency and the California Air Resources Board (EPA and CARB) revealed their findings that while testing diesel cars of the Volkswagen Group they have detected manipulations that violate American environmental standards.

The Board of Management at Volkswagen AG takes these findings very seriously. I personally am deeply sorry that we have broken the trust of our customers and the public. We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly, and completely establish all of the facts of this case. Volkswagen has

ordered an external investigation of this matter.

The recall affects 482,000 diesel-powered cars sold in the US since 2008. They include:

Volkswagen Jetta TDI: 2009-20015
Volkswagen Beetle TDI: 2009-2015
Audi A3 TDI: 2009-2015
Volkswagen Golf TDI: 2009-2015
Volkswagen Passat TDI: 2014-2015
We have reached out to Volkswagen and the DOJ for comment. We will update when when we hear back.

Fortune:

Dear Volkswagen: Exaggeration? Not so bad. Deception? Never okay
by Jennifer Reingold @jennrein SEPTEMBER 21, 2015, 3:44 PM EDT

One wonders what would have happened had Volkswagen opted for exaggerating its results rather than falsifying them.

The business world—and the journalists who cover it—have always rewarded a healthy bit of hype. Best Ever! New and Improved! Now with enhanced whatevers!

Actually, the love of the big claim goes far beyond the business world and is interwoven throughout society. Donald Trump's current popularity is only the latest example of bombast, er, trumping reality.

But we do have limits, as the scandal at Volkswagen shows. So far, the company's stock price has fallen almost 20% since it admitted on September 18 that it had installed software that allowed its cars to fake their performance on emissions testing in order to fool the EPA.

No one knows what will happen to the $221 billion in sales car company—the world's largest—going forward, and whether the deception stretches all the way to the CEO, Martin Winterkorn. But one wonders what would have happened had the company opted for exaggerating its results rather than falsifying them.

Don't get me wrong: I'm not advocating that any performance standards—particularly those that affect safety and health—should ever be presented with anything but the full truth. But this move was so brazen, so breathtakingly full of chutzpah, that it is hard to imagine VW's brand recovering for a very, very long time; nor, one imagines, will its culture.

The plot goes far beyond one or two people hiding out in a cubicle and must have involved hundreds of people building such a system and making sure it was implemented inside of 428,000 cars. One wonders what the company might have been able to accomplish instead

if it put all that brainpower toward meeting emissions requirements rather than circumventing them.

Consider the alternative: VW tried—and failed—to meet the EPA's emissions standards, after saying that they believed they had diesel engines that did the job. The EPA (which, it's worth noting, relies primarily on self-tested data) would have—hopefully—tested its engines, found Volkswagen deficient, and fined the company. It would have been costly, yes, but it wouldn't have been all that surprising. And VW's credibility wouldn't have been destroyed in the process. After all, exaggeration, for better or worse, is just how the game is played.

MarketWatch:
http://www.marketwatch.com/story/white-house-quite-concerned-about-volkswagen-emissions-charges-2015-09-21

White House 'quite concerned' about Volkswagen emissions charges
'Quite concerned': How White House press secretary Josh Earnest characterized Obama administration reaction to the allegations against Volkswagen.
By ROBERT SCHROEDER

The Obama administration is "quite concerned" over allegations that Volkswagen cheated on U.S. emissions tests, a White House spokesman said Monday, but added it is up to the Environmental Protection Agency to investigate the matter.

"I think it's fair to say that we're quite concerned by some of the reports that we've seen about the conduct of this particular company," spokesman Josh Earnest told reporters at a regular briefing.

On Friday, the Environmental Protection Agency and the California Air Resources Board alleged that Volkswagen VLKAY, -17.38% VOW3, -18.19% used software in cars to make diesel-powered engines appear to have lower levels of emissions than they actually did. The company halted U.S. sales of some diesel-powered cars.

Earnest said it is ultimately the responsibility of the EPA to look at the issue, "and that's exactly what they're doing."

Reaction from Congress was minimal — though that could change.

"VW should expect scrutiny from Congress, legal problems, a potential multibillion-dollar fine and a batch of uncomfortable headlines," wrote Forbes contributor Micheline Maynard on Monday.

"If Volkswagen willfully sought to evade the Clean Air Act and fraudulently sold cars to millions of consumers with this technology, EPA should pursue the most severe action possible to deter others from doing the same," Rep. Frank Pallone, a New Jersey Democrat,

said on Friday.

"We must ensure that this does not happen again and that consumers can trust the products that they buy," said Pallone, the top Democrat on the House Energy and Commerce Committee. The panel's oversight and investigations subcommittee held one of the several hearings into the General Motors GM, +0.43% ignition-switch recall in April 2014.

The allegations reportedly include Volkswagen Passats made at the company's Chattanooga, Tenn., facility in 2014 and 2015. A Volkswagen spokesperson did not immediately return a request for comment.

MarketWatch reached out to members of Tennessee's congressional delegation, but none offered any comment.

The 1,400-acre Chattanooga plant has more than 3,200 Volkswagen employees, the company says.

Volkswagen's appalling clean diesel scandal, explained
Brad Plumer

It sounds like the sinister plot of some straight-to-DVD movie. Since 2009, Volkswagen had been installing elaborate software in 482,000 "clean diesel" vehicles sold in the US, so that the cars' pollution controls only worked when being tested by regulators. The rest of the time, the vehicles could freely spew hazardous, smog-forming nitrogen oxides.

Suffice to say, regulators were livid once they caught on. On Friday, the Environmental Protection Agency announced that Volkswagen had very flagrantly violated the Clean Air Act. Not only did the EPA order the German company to fix the affected vehicles,** but the agency has the authority to levy fines as high as $37,500 per car, a maximum of $18 billion. (To put that in perspective, the company's pretax net income was about $4.7 billion last year.) The US government is also mulling criminal charges.

Volkswagen, in other words, is in deep shit. The company's CEO, Martin Winterkorn, is now apologizing profusely and pledging an external probe to find out what happened. VW just halted US sales of its 2015 and 2016 clean diesel vehicles, including Passat, Jetta, Golf, and Beetle models. Meanwhile, VW's stock price plummeted on Monday morning, the

company losing nearly one-fifth its market cap in a blink:

This scandal raises a few larger questions, though: Why did Volkswagen cheat in the first place? And why was it so easy for the company to evade regulators for years? To get a better handle on the story, we need to take a brief trip through the tangled history of clean diesel vehicles — the specific cars that VW was selling.

Clean diesel cars were supposed to offer great mileage and low pollution — a tricky task

One basic fact to understand here is that there are two main types of combustion engines widely available today: diesel and gasoline. And there are real trade-offs to each.

Diesel engines have long been popular in Europe, and one of their major advantages is fuel economy. Diesel fuel contains more energy per gallon than gasoline, and the diesel engines themselves are more efficient. Put it together, and the typical diesel car can travel up to 30 percent farther on a gallon of fuel than its gasoline counterpart.

But there's a catch. While diesel cars get better mileage and emit fewer carbon-dioxide emissions, they also emit more nitrogen oxides (NOx), which help form smog, and particulate matter, which can damage lungs. Both types of pollution can have serious health effects.

Historically, Europe has dealt with this trade-off by imposing looser emissions standards on diesel cars in order to pursue higher fuel economy. That's one reason European cities like Athens have a serious smog problem. In the United States, by contrast, we've imposed much stricter rules around smog and other conventional pollutants since the 1970s, one reason diesel cars haven't caught on as widely here. (Heavy trucks favor diesel engines, though.)

In recent years, however, things have shifted. The Obama administration has been ratcheting up fuel-economy standards in the United States, which puts a higher premium on mileage. At the same time, diesel technology has gradually been getting cleaner through a combination of lower-sulfur fuel, advanced engines, and new emission-control technology. So automakers have shown a renewed interest in "clean diesel" cars that, in theory, don't suffer from that trade-off between performance and pollution.

These vehicles have proved popular in the United States. Since 2009, Volkswagen has sold more than 482,000 clean diesel cars containing a four-cylinder turbocharged direct injection engine. This included versions of the Passat, Jetta, Golf, Beetle, and Audi's A3. Drivers liked them.

Except, as it turns out, VW was lying about its clean diesel cars.

Volkswagen couldn't balance performance with low pollution. So it cheated.

Since 2009, we now know, Volkswagen had been inserting intricate code in its vehicle software that tracked steering and pedal movements. When those movements suggested that

the car was being tested by regulators in the laboratory for nitrogen-oxide emissions, the car automatically turned its pollution controls on. The rest of the time, the pollution controls switched off.

Regulators didn't notice this ruse for years. The problem was only uncovered by an independent group, the International Council on Clean Transportation, which wanted to investigate why there was such a discrepancy between laboratory tests and real-road performance for several of VW's diesel cars in Europe. So they worked with researchers at West Virginia University, who stuck a probe up the exhaust pipe of VW's clean diesel cars and drove them from San Diego to Seattle. (These details come from Dana Hull and Jeff Plungis' excellent Bloomberg tick-tock.)

What the researchers found was jaw-dropping. On the road, VW's Jetta was emitting 15 to 35 times as much nitrogen oxide as the allowable standard. The VW Passat was emitting 5 to 20 times as much. These cars were emitting much more pollution than they had in the labs.

Both California's air-pollution regulator and the EPA ordered Volkswagen to investigate and fix the problem in May 2014, and the company said it had worked on a software patch. Once again, the cars performed well in testing. And once again, real-world performance didn't match up. At that point, regulators started grilling Volkswagen's engineers about the discrepancy, and the company eventually cracked, admitting the existence of these defeat devices, which had been carefully hidden in the software code. Hence the scandal.

Volkswagen hasn't explained exactly why it cheated, but outside analysts have a pretty good guess. The NOx emission controls likely degraded the cars' performance when they were switched on — the engines ran hotter, wore out more quickly, and got worse mileage. Some experts have suggested that the emission controls may have affected the cars' torque and acceleration, making them less fun to drive. (Indeed, some individual car owners have been known to disable their cars' emission controls to boost performance, though this is against the law.)

In other words, Volkswagen wasn't able to produce diesel cars that had the ideal mix of performance, fuel economy, and low pollution. (Or, at least, they couldn't do this profitably.) So they "solved" this trade-off by sacrificing cleanliness and loosening the emission controls. And they accomplished this via software designed to deceive regulators. This was wildly illegal, and they got caught.

The VW scandal exposes problems with current emission tests

Volkswagen isn't the first company to cheat on its emission tests. As Frank O'Donnell of Clean Air Watch pointed out to me, the EPA caught a number of truck manufacturers, including Caterpillar and Volvo, doing something similar back in 1998 — programming their diesel trucks to emit fewer pollutants in lab tests than they did on the road. (The trucks would slowly emit more and more NOx as they traveled longer distances at constant speed, something that labs couldn't catch.)

Part of the problem here is that regulators tend to test these vehicles in laboratory conditions, which are fairly predictable and hence easier to game. Combined with the fact that automakers are developing ever-more-elaborate software that can control and fine-tune engines, and there are ample opportunities for fraud.

EUROPEAN REGULATORS WILL SOON START REQUIRING ON-ROAD EMISSIONS TESTING

In theory, there are ways to make cheating harder. Starting with model year 2017 vehicles, European regulators are going to start requiring automakers to test their passenger cars on the road in addition to laboratory testing. That sort of regime would've made it harder for Volkswagen to do what it did. But it's also unlikely that this is the last time we'll see an automaker come up with a fiendishly clever way to cheat.

Meanwhile, the VW scandal raises another issue surrounding car regulations, as Alex Davies explains at Wired. Modern-day cars feature complex computer systems and software. And, right now, this software is protected under the 1998 Digital Millennium Copyright Act — it's illegal to fiddle with it. The ostensible rationale is to make it harder for consumers to tamper with emissions controls. But these protections also make it harder for independent researchers to scrutinize that code and identify problems like VW's little emissions trick. Some experts have proposed DMCA exemptions to allow researchers to test and evaluate these engines, but so far automakers and the EPA have resisted this. Presumably, if those exemptions had existed, Volkswagen might've been caught sooner.

Volkswagen is now facing serious consequences

At this point, Volkswagen has been caught red-handed and has to face the consequences. The company straight-up lied about its cars and exacerbated the country's air-pollution problem. (Getting a precise estimate of the health consequences here could be difficult, since it depends on where the cars were located, how much extra smog actually resulted, and so forth.)

In response, the company has pledged to stop selling 2015 and 2016 Volkswagen and Audi models equipped with clean diesel engines and will likely end up recalling the 482,000 cars now on the road to fix the software.** It's unclear how many customers will want to "fix" the problem, however, since, again, any patch might degrade gas mileage and/or performance.

Meanwhile, Volkswagen could face criminal prosecution — not to mention billions of dollars in fines, potentially. The Clean Air Act allows a fine of $37,500 per noncompliant vehicle. If the EPA really wanted to lower the hammer, that would amount to $18 billion. Again, VW's pretax net income was about $4.7 billion last year, so that would be a crippling hit. Volkswagen is the world's biggest automaker by sales, but it's not quite as profitable as competitors like Toyota and has already struggled to gain a foothold in the US market. This could be a huge deal for the company.

It also raises questions about the future of clean diesel vehicles. Clean diesel appears to be a promising technology — in theory, these vehicles could get both excellent mileage and low emissions. But this scandal raises serious questions about how well automakers can actually achieve both goals in practice.

** For any concerned car owners, the models expected to be recalled include: The 2009-2015 VW Beetle 2.0L TDI; 2009-2015 VW Golf 2.0L TDI; 2009-2015 VW Jetta 2.0L TDI; 2009-2015 Audi A3 2.0L TDI; and 2014-2015 VW Passat 2.0L TDI.

Ledger Gazette:
http://www.ledgergazette.com/epa-accuses-vw-of-cheating-on-emissions-tests/79148/

EPA accuses VW of cheating on emissions tests
BY JORGE WEINER ON SEPTEMBER 21, 2015 BUSINESS

VW halted sales of the models involved on Sunday and said it's cooperating with the probe and ordered its own external investigation into the issue.

"The charges here are truly appalling: that Volkswagen knowingly installed software that produced much higher smog-forming emissions from diesel vehicles in the real world than in pre-sale tests", said Frank O'Donnell, president of Clean Air Watch, a Washington-based advocacy group.

VW is to stop selling four cylinder diesel cars in the USA after the firm was found to have rigged emissions test on up to 500,000 vehicles, it has emerged. The reality is that Volkswagen will face huge fines, rumoured to be as high as 18 billion US dollars.

German competitors BMW AG and Daimler AG said on Monday they aren't aware of a similar USA probe into their cars.

Once on the road, the cars produced nitrogen oxide pollutants at up to 40 times the legal standard.

The EPA and California authorities acted quickly after being told of the violation, German said.

Volkswagen, which recently edged out Japan's Toyota to become the world's top-selling automaker, has had a hard year, its share price having fallen from more than 250 euros amid signs of faltering sales in the US and China. He said he was "deeply sorry" for the violation of United States rules. The models include Jetta, Beetle, Golf, Passat and Audi A3.

Stefan Bratzel, director at the Center for Automotive Management, a research group, said the damage to VW's image would be as great as the financial fines.

"Our climate policy stands for itself and I think it's internationally recognized that Germany is one of the drivers on the way to (the global climate summit in) Paris", he said. The potential wonderful is $37,500 per vehicle and 482,000 autos are a part of the case, yielding a possible superb of greater than $18 billion, Giles stated on a telephone name with reporters Friday.

The EPA in November 2014 hit South Korean auto makers Hyundai Motor Co. and Kia Motors Corp. with a record $100 million penalty for overstating fuel-economy claims and forced the companies to cough up another $200 million in regulatory credits.

The cars allegedly do so with software that detects when the vehicle is undergoing emissions testing, and then turns full emissions controls on only during the test. When vehicles are being driven normally, the computer disables the emissions controls.

According to the The New York Times, this latent software within numerous Volkswagen vehicles switches on emissions control systems only during an inspection. The California Air Resources Board issued a similar letter.

"Our goal is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules and to take appropriate further action".

The feature, which the EPA called a "defeat device", masks the true emissions only during testing.

VW under fire amid EPA accusations it cheated on emissions tests
By Thad Moore

Volkswagen shares plunged Monday after U.S. regulators accused the German automaker of cheating on emissions tests, alleging that nearly 500,000 cars weren't meeting federal standards.

An apology Sunday from VW's chief executive did nothing to temper anxious investors, who wiped out nearly a fifth of the company's value in a single day. VW's stock closed the

day Monday at 132.20 euros, down 19 percent.

The selloff comes on the heels of Environmental Protection Agency allegations that the automaker had designed software to let its diesel cars detect when they were being tested for emissions.

VW, one of the world's largest automakers, has halted sales of some vehicles in the United States and pledged to cooperate with regulators. "We at Volkswagen will do everything that must be done in order to re-establish the trust that so many people have placed in us, and we will do everything necessary in order to reverse the damage this has caused," Martin Winterkorn, VW's chief executive, said in a statement.

In the lab, they met standards. On the road, regulators say, they emitted nitrous oxide at up to 40 times federal standards. The software, known as a "defeat device," was installed in some 482,000 cars, spanning model years 2009 through 2015, regulators say.

The EPA and California regulators began asking questions in May 2014 after West Virginia University researchers published a study that found lab results didn't match up with road tests.

For more than a year, VW told regulators that the difference owed to "various technical issues and unexpected in-use conditions," the EPA said in a letter sent to the automaker Friday. But company officials didn't admit to the practice until earlier this month when regulators threatened not to approve its 2016 line of diesel cars.

The years-long practice could carry a hefty price tag for the automaker. The company could be fined $37,500 for each car it sold with a defeat device installed — a potential fine of $18 billion.

"The company will have to recall nearly 500,000 affected cars, which will cost it millions of dollars, and that's even before the damage to its brand and potential fines," Michael Hewson, chief market analyst at CMC Markets, told the Associated Press.

The revelation also led Consumer Reports[consumerreports.org] to pull its recommendation of VW's Jetta and Passat diesel model. (The magazine said it would reconsider its decision once the automaker introduces a fix to lower emissions.)

For his part, Winterkorn apologized Sunday, saying the company would cooperate "with transparency and urgency."

"I personally am deeply sorry that we have broken the trust of our customers and the public," he said in a statement. "We do not and will not tolerate violations of any kind of our internal rules or of the law."

Volkswagen Denied Deception to E.P.A. for Nearly a Year
By JACK EWING SEPT. 21, 2015

FRANKFURT — For nearly a year, Volkswagen officials told the Environmental Protection Agency that discrepancies between the formal air-quality tests on its diesel cars and the much higher pollution levels out on the road were the result of technical errors, not a deliberate attempt to deceive Washington officials.

But early this month, Volkswagen executives finally made a startling admission: The diesels it sold in the United States had software deliberately designed to cheat on the tests.

The company was evidently concerned that actually meeting the federal emissions standards would degrade the power of the engines, which it marketed as comparable in performance to gasoline engines. Meeting the standard would also undercut the fuel efficiency that is one of the main selling points of diesels.

The admission came only after the E.P.A. threatened to withhold approval for Volkswagen's new 2016 models, according to letters sent to company officials by the E.P.A. and California regulators.

Since news of that mass deception broke on Friday, Volkswagen has scrambled to conduct damage control, with its chief executive issuing an apology and the company saying it would not sell its 2015 and 2016 diesel cars in the United States.

But that did not stop Volkswagen shares from plummeting when trading opened in Europe on Monday. And the apology has not relieved pressure on Martin Winterkorn, the Volkswagen chief executive, whom analysts said would have tough questions to answer, seeking to know when he and other top executives at the company, which is ruled from the top with Germanic precision, were aware of the diesel deception.

Adding to pressure on Volkswagen, the German government said on Monday that it would also begin an inquiry to make sure that Volkswagen and other carmakers are complying with laws on auto emissions.

The E.P.A. disclosed the yearlong series of letters with Volkswagen as part of accusations it made against the company on Friday. The agency will require the company to recall nearly half-a-million vehicles equipped with 2-liter diesel engines dating to the 2009 model year.

Volkswagen also faces fines that could run into the billions of dollars.

Volkswagen shares plunged about 20 percent on Monday, as investors registered alarm at the damage the company could suffer.

Mr. Winterkorn issued an apology on Sunday, saying the company had "broken the trust of our customers and the public."

But the sophistication of the software used to manipulate emissions tests in the United States, and extensive attempts by Volkswagen to deflect official scrutiny before admitting misconduct this month, are sure to raise questions about Mr. Winterkorn's effectiveness only months after he survived an internal power struggle.

"Either he knew, or he didn't know, which is even worse," said Ferdinand Dudenhöffer, a professor at the University of Duisburg-Essen who is a longtime Volkswagen critic. "Any politician in his situation would have to resign."

Volkswagen's supervisory board, which Mr. Winterkorn reports to, will hold a regularly scheduled meeting on Friday, and it is certain to discuss the E.P.A. action.

After being confronted last year with evidence that some diesel models did not comply with pollution standards under certain conditions, Volkswagen executives originally offered technical explanations, according to a letter of complaint sent to the company by the E.P.A. and the California Air Resources Board.

It was only on Sept. 3, according to the letters, that executives at Volkswagen of America, the company's United States unit, admitted that cars equipped with the 2-liter diesel motors contained the software.

The software measured factors such as the position of the steering wheel, the vehicle's speed and even barometric pressure to sense when the car was being subjected to testing, the E.P.A. said. The car then configured itself to reduce emissions of nitrogen oxide, a gas that is a major contributor to smog and is linked to an array of respiratory ailments including asthma, emphysema and bronchitis, the E.P.A. said on Friday.

Volkswagen is known for being a tightly controlled, autocratic organization, raising questions about how such a sophisticated system could have been installed in nearly half a million vehicles without knowledge of top management.

The plunge in Volkswagen shares was a clear indication that investors believe that company profit and sales could suffer because of the E.P.A. accusations. However, Volkswagen is relatively immune to stock market pressure because only 12 percent of its voting shares are traded. Porsche Automobil Holding, controlled by members of the Porsche family, holds a slight majority. The state of Lower Saxony owns 20 percent and the sovereign wealth fund of Qatar owns 17 percent.

Stephan Weil, the prime minister of Lower Saxony, where Volkswagen has its headquarters and major manufacturing operations, said in a statement on Monday, "Manipulation of an emissions test is completely unacceptable and without any justification."

But Mr. Weil said consequences could be discussed only after a thorough investigation of the circumstances.

In Berlin, the government of Chancellor Angela Merkel said it would ask carmakers for information as the first step in an inquiry.

"We expect reliable information from carmakers so that the Federal Office for Vehicles can check whether similar manipulation in the exhaust systems has taken place in Germany or Europe," Andreas Kübler, a spokesman for the Environment Ministry, told reporters in Berlin.

The European Commission has contacted Volkswagen as well as the E.P.A. for details about the accusations, a commission spokeswoman said.

"It is premature to comment on whether any specific immediate surveillance measures are also necessary in Europe and whether vehicles sold by Volkswagen in Europe are also affected," the spokeswoman said in an email. "We are taking the matter very seriously."

South Korea also planned to test Volkswagen cars to make sure they were in compliance with pollution rules, according to news reports.

More than half of all vehicles sold in Europe are diesels, which are popular because they typically offer better fuel economy than gasoline. European Union pollution rules were more favorable to diesels than United States rules, but they have been progressively tightened. The most recent standard, known as Euro 6, took effect for all new cars sold on Sept. 1.

Technology exists to reduce the amount of nitrogen oxides emitted by diesels. But the technology also tends to reduce fuel economy as well as performance. The software installed by Volkswagen on vehicles sold in the United States avoided this trade-off, which could have come as a disappointment to American customers, by scaling back pollution controls when the car was not being tested.

The accusations by the E.P.A. are a blow to Volkswagen's efforts to build up its meager market share in the United States, in part by promoting "clean diesel" technology.

The silver lining for Volkswagen, though, may be that its most profitable vehicles in the United States are Porsche and Audi cars not affected by the E.P.A. action. The cars affected are Volkswagen Golf, Jetta, Beetle and Passat models from 2009 through 2015 that are equipped with 2-liter diesel engines.

Another silver lining for Volkswagen may be that diesel powered cars account for only a

tiny fraction of sales in China, which is the company's largest market.

Among Audi models, only the compact A3 is affected in the United States. The A3 accounted for less than a fifth of the 111,000 vehicles that Audi sold in the United States from January through August, and only a fraction of those A3s would have been equipped with diesels.

The E.P.A. said on Friday that Volkswagen would be required to recall the affected vehicles for repairs to make them compliant with smog regulations. Car owners would not have to pay for the repairs. Many owners may not bother, though, because the changes are likely to reduce fuel consumption and performance.

John Schilling, a Volkswagen spokesman, said on Sunday that the company would stop selling 2015 and 2016 Volkswagen and Audi models equipped with the 2-liter diesel engines, which the company had marketed as "clean diesel." The company will also stop selling used cars that have the engines, Mr. Schilling said.

He said he did not know how many models would be stuck on dealer lots as a result of the decision. This month, Volkswagen had said that 23 percent of new cars sold in August in the United States were diesels, or 7,400 vehicles. Some diesels, such as those used in Volkswagen S.U.V.s, are not affected by the E.P.A. action.

Faulty Tests Cost VW Billions
By FRANK JORDANS and PAN PYLAS, Associated Press

BERLIN (AP) — Around 15 billion euros ($16.9 billion) was wiped off the market value of Volkswagen AG on Monday following revelations that the German carmaker rigged U.S. emissions tests for about 500,000 diesel cars.

By midday trading in Frankfurt, Volkswagen's share price was 19.3 percent lower at a three-year low of 130.20 euros. Its dramatic fall weighed heavily on Germany's main stock index, the DAX, which underperformed its peers in Europe with a 0.6 percent decline.

Volkswagen's market woes Monday follow a weekend that saw the company's reputation for probity seriously damaged by revelations from the Environmental Protection Agency in

the U.S. that it had skirted clean air rules. All told, the EPA indicated that VW faces fines that could run up to more than $18 billion.

The EPA said VW used a device programmed to detect when the cars are undergoing official emissions testing. The software device then turns off the emissions controls during normal driving situations, allowing the cars to emit more than the legal limit of pollutants.

Volkswagen marketed the diesel-powered cars, which account for about 25 percent of sales, as being better for the environment. The cars, built in the last seven years, include the Audi A3, VW Jetta, Beetle, Golf and Passat models.

"The company will have to recall nearly 500,000 affected cars, which will cost it millions of dollars, and that's even before the damage to its brand and potential fines," said Michael Hewson, chief market analyst at CMC Markets.

The agency has ordered VW to fix the cars at its own expense but said car owners do not need to take any immediate action. The EPA insisted that the violations do not pose any safety hazard and said the cars remain legal to drive and sell while Volkswagen comes up with a plan to recall and repair them. However, it said the cars posed a threat to public health.

The EPA also indicated the scale of the fines that could be imposed on VW. It said the carmaker could be hit up to $37,500 per vehicle for the violations — a total of more than $18 billion. The California Air Resources Board is also investigating.

Volkswagen has had a difficult year, its share price having fallen from over 250 euros amid signs of faltering sales in the U.S. and China.

VW edged out Toyota to become the world's top-selling automaker the first half of 2015. But a hit to its reputation from the emissions revelations could hamper its efforts at a sales rebound in the U.S.

If other regulatory authorities decide VW has a case to answer, then the carmaker faces the potential for even bigger fines.

"The news so far revolves around the U.S. impact, but if European investigators become interested the potential penalties could multiply very quickly," said Chris Beauchamp, senior market analyst at IG.

Volkswagen 'sorry,' promises probe on EPA violations
By DANIEL CHAITIN (@DANIELCHAITIN7) • 9/20/15 3:23 PM

Volkswagen apologized Sunday following allegations by the Environmental Protection Agency and the state of California that hundreds of thousands of diesel cars made by the German automaker are breaking emissions laws in the United States.

"The Board of Management at Volkswagen AG takes these findings very seriously," wrote Martin Winterkorn, CEO of Volkswagen. "I personally am deeply sorry that we have broken the trust of our customers and the public. We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly, and completely establish all of the facts of this case. Volkswagen has ordered an external investigation of this matter."

On Friday, the EPA and California charged Volkswagen with willfully installing software in its 4-cylinder diesel cars that would allow cars to bypass emission standards. The cars cited for violations include signature Volkswagen cars manufactured between 2009 and 2015, including the Jetta, Passat, Beetle and Golf, as well as the A3 from Audi, Volkswagen's luxury line.

All together, about 482,000 diesel passenger cars sold in the United States since 2008 are included in the allegations.

The statement promises that Volkswagen will "re-establish trust" it may have lost and that the company will reverse any damage done.

"We do not and will not tolerate violations of any kind of our internal rules or of the law," Winterkorn added.

The EPA issued a notice of violation to Volkswagen, while the state of California sent an In-Use Compliance letter. Both the EPA and the California Air Resources Board are conducting separate investigations into the alleged misbehavior.

Recalls are likely, and the combined fines could add up to $18 billion if the result of the investigations support the allegations.

The EPA alleges that the Volkswagen cars are fitted with software to trick emission testers, but that under normal operation emit nitrogen oxides at up to 40 times the standard. Under the Clean Air Act, such an instrument is classified as a "defeat device."

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, EPA assistant administrator for the Office of Enforcement and Compliance Assurance. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

The Epoch Times:

http://www.theepochtimes.com/n3/1755607-volkswagen-circumvents-epa-rule-its-not-the-first-time/

Volkswagen Skirts EPA Rules; It's Not the First Time
By Arleen Richards

Volkswagen Group of America admitted to sidestepping clean air standards after the EPA and California's clean air watchdog confronted the German automaker with evidence of high in-use emissions from light-duty diesels.

On Friday, Sept. 18, the EPA slapped VW with a notice of violation for using sophisticated software to circumvent national emissions standards. The software, which the EPA calls a "defeat device," is designed to implement full emissions control systems when the car is undergoing state emissions testing. During normal driving, the emissions control is turned off, permitting the significantly harmful diesel fumes to be expelled—40 times more than allowed under the Clean Air Act. VW and the California Air Resources Board (CARB) have both initiated investigations.

Volkswagen CEO Dr. Martin Winterkorn, on Sunday, apologized for breaking the public's trust and vowed to cooperate fully with agency investigations.

He ordered an internal investigation, saying in a statement, "We do not and will not tolerate violations of any kind of our internal rules or of the law."

But this episode is not the first time the EPA or CARB has had run-ins with VW. In the past, both agencies charged VW with similar violations, which resulted in penalties.

Defective Oxygen Sensors
VW previously failed to report its discovery of emission defects in at least 329,000 of its 1999, 2000, and 2001 Golf, Jetta, and New Beetle vehicles.

In May 2001, after conducting a random test, the EPA identified a problem with tailpipe emissions in the 1999 model vehicles caused by a failed oxygen sensor. It turns out, VW knew about the problem for a year already—since it had received numerous warranty claims associated with cracked oxygen sensors—but failed to report it. According to the Clean Air Act, any emission-related defect found in 25 vehicles or engines of the same model year has to be reported within 15 days.

VW spent $26 million in January 2002 to recall all the vehicles and replace or repair the part. Another estimated $660,000 was spent on an enhanced defect tracking system.

The EPA finally settled its case with VW in 2005, penalizing the delinquent car maker $1.1 million.

The state of California has been working closely with the EPA in testing VW cars and issued a separate notice of violation to VW in the current case.

California has been a leader in clean energy investments and set the stage in 2006 for transitioning to a sustainable, low-carbon future with the passage of AB 32, a law requiring sharp reduction in greenhouse gases. Since then, several legislative initiatives have been implemented to build the next generation of clean, fuel-efficient cars.

The CARB implements the state's vehicle regulations through a vigorous certification process, as well as compliance and enforcement programs. It regularly tests vehicles to ensure compliance with air quality standards.

In 2004, VW settled a case with CARB for $552,500 for selling cars in California that had not been properly certified. VW admitted to selling 84 new 2002 vehicles from several retail locations throughout the state, attributed to an error in its electronic ordering system.

The EPA is expected to compel VW to issue a recall notice in order to remedy the current emissions problem, which could take up to a year after identifying the appropriate corrective action and a recall plan.

Jalopnik:

Volkswagen Tells Dealers To Halt Sales Of New TDI Cars Amid Diesel Cheating Scandal
Alanis King

Following the government investigation of Volkswagen's diesel emissions, The Detroit News reports the automaker ordered its U.S. dealerships to halt sales of new 2016 and remaining 2015 TDI car models with 2.0-liter diesel engines.

According to the Environmental Protection Agency and California Air Resources Board, VW dodged federal emissions requirements for some 482,000 of its diesel cars — including the Passat, Jetta, Golf, Beetle, SportWagens and Audi A3 — manufactured from 2009 to 2015. The models contain a "defeat device" which exists to detect when the car is under testing conditions, allowing for it to activate the full emissions-control systems only in those circumstances.

In other words, environmental officials say that the street cars are emitting between 10 and 40 times the amount of allowable nitrogen oxide pollution, which is not only illegal but harmful to both the environment and public.

The EPA is taking action on 2016 diesel models. Christopher Grundler, director of the EPA Office of Transportation of Air Quality, said that the government will not grant VW a "certificate of conformity" to sell the 2016 models with 2.0-liter diesel engines, meaning they cannot be sold.

VW dealers have been waiting for the 2016 models to replenish showrooms. Most U.S. VW

dealers don't have any remaining 2015 diesel cars to sell.

VW is barred from selling 2016 model vehicles with the 2.0 liter diesel engine until "they get answers to the questions of how these vehicles are being operated. Volkswagen couldn't explain why we're getting these excess emissions," Grundler said.

Meanwhile, whatever 2015 models remain on lots have also been ordered not to be sold. As Automotive News notes, four-cylinder TDI models account for 20 to 25 percent of VW's U.S. sales, so this is going to hurt.

In addition, VW has ordered an outside investigation to find out what happened and "reverse the damage this has caused," CEO Martin Winterkorn said in an apologetic statement.

According to the EPA, the agency is now checking to see if other automakers are bypassing the laws on diesel engines as well.

While no official recall is underway just yet, the News reports:

EPA said VW violated federal law and, in theory, could face fines of up to $18 billion — $37,500 per vehicle — as well as criminal prosecution. Both agencies issued notices of non-compliance to VW Friday, a step necessary before ordering a recall.

The EPA will not take action to stop VW owners from driving their personal cars until a solution is made available, but VW did remove its "clean diesel" advertisements from YouTube and television.

CBC News (Canada):
http://www.cbc.ca/news/business/volkswagen-emissions-rigging-1.3236548

Volkswagen shares plunge on emissions rigging scandal
Consumer Reports suspends 'recommended' rating for Jetta and Passat diesels
CBC News Posted: Sep 21, 2015 9:00 AM ET Last Updated: Sep 21, 2015 9:00 AM ET

Volkswagen's CEO apologized but investors were not in a forgiving mood as the company's stock plunged almost 20 per cent Monday following revelations late last week that the automaker had rigged emissions tests for almost 500,000 diesel cars in the U.S.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Martin Winterkorn said in a weekend statement.

On Friday, the U.S. Environmental Protection Agency (EPA) revealed that half a million diesel-powered VWs had been programmed to bypass emission controls except during emissions tests. The cars include the Audi A3, VW Jetta, Beetle, Golf and Passat models made in the last seven years.

The EPA ordered VW to fix the cars and VW said it would co-operate with regulators. But the damage to the automaker's image is nothing less than catastrophic.

VW had marketed its diesel-powered cars as being better for the environment. The Associated Press reports, citing an anonymous source with knowledge of the matter, that VW has told dealers to stop selling its 2015 diesel cars with 2.0-litre engines.

The EPA said the VW cars under investigation seemed to pass emissions tests, but in the real world, were actually emitting up to 40 times the national standard for nitrogen oxide, which is linked to asthma and lung illnesses.

Consumer Reports announced it would remove its "recommended" rating from the Jetta and Passat diesels until it can retest the vehicles.

VW could face fines of up to $18 billion US, according to the EPA.

Volkswagen shares plunged 19.4 per cent in Monday trading in Germany, chopping $21 billion Cdn from the market value of the company.

"The company will have to recall nearly 500,000 affected cars, which will cost it millions of dollars, and that's even before the damage to its brand and potential fines," said Michael Hewson, chief market analyst at CMC Markets.

Diesel-powered models account for about a quarter of VW's sales.

Impact in Canada unclear

At this point, it isn't clear what the revelations mean for owners of VW diesels in Canada. Volkswagen Canada told CBC News on Friday that it first learned of the EPA action earlier that morning. It said it would co-operate with Environment Canada "to understand the implications for the Canadian market and what actions, if any, may be required in Canada."

Environment Canada, for its part, said it was in talks with the EPA "to further examine this issue and assess potential implications for Canada." Environment Canada also said it collaborates on emissions verification activities with the U.S. EPA "to ensure our common environmental outcomes are achieved," and pointed out that its emissions standards are aligned with U.S. standards.

The EPA and Environment Canada both stressed that the effectiveness of a vehicle's air pollutant control devices is not a safety issue. The cars remain legal to drive.

http://www.nytimes.com/2015/09/21/business/international/volkswagen-chief-apologizes-for-breach-of-trust-after-recall.html?_r=0

Volkswagen to Stop Sales of Diesel Cars Involved in Recall
By JACK EWING and CORAL DAVENPORTSEPT. 20, 2015

FRANKFURT — Volkswagen said on Sunday that it would halt sales of cars in the United States equipped with the kind of diesel motors that had led regulators to accuse the German company of illegally installing software to evade standards for reducing smog.

John Schilling, a Volkswagen spokesman, said that the company would stop selling 2015 and 2016 Volkswagen and Audi models equipped with 4-cylinder turbo diesel engines, which the company has marketed as "clean diesel." The company will also stop selling used cars that have the engines, Mr. Schilling said.

He said he did not know how many models would be stuck on dealer lots as a result of the decision. Earlier this month, Volkswagen had said that 23 percent of new cars sold in August in the United States were diesels, or 7,400 vehicles.

The confirmation of the halt in sales came on the same day that Martin Winterkorn, the chief executive of Volkswagen, apologized for conduct that prompted the Environmental Protection Agency to order Volkswagen to recall nearly half a million vehicles.

An employee on the Audi A3 limousine. The recall involves four-cylinder Volkswagen and Audi vehicles from the model years 2009 to 2015. Credit Szilard Koszticsak/European Pressphoto Agency
Volkswagen could face billions of dollars in fines for what the E.P.A. said was a deliberate attempt to evade rules on emissions. The decision to stop sales was first reported by The Wall Street Journal.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Mr. Winterkorn said in a statement.

He said the company would "cooperate fully" with the authorities and order its own independent investigation into the accusations.

In his statement, Mr. Winterkorn did not contest assertions by the E.P.A. that Volkswagen sold cars equipped with software that could detect when periodic state government emissions testing was taking place.

Only during such tests are the cars' full emissions control systems turned on. During normal

driving situations, the controls were turned off, allowing the cars to spew as much as 40 times the pollution allowed under the Clean Air Act, the E.P.A. said.

Diesel-driven cars have enjoyed something of a renaissance in recent years, shedding much of their old stigma for being dirty, clanky and sluggish to drive, said Karl Brauer, an analyst at Kelley Blue Book. And in the United States, he said, Volkswagen has clearly led the pack — offering diesel vehicles that performed just like their gasoline counterparts.

"Now, we have to wonder if the technology really advanced as far as we thought at VW," Mr. Brauer said. "They must have had a problem making it work in a way that delivered truly clean diesel. At least clean enough to meet the regulations."

Mr. Brauer said the higher nitrous oxide emissions probably allowed better drivability. Fuel economy also improves with more nitrous emissions, and engines can run cooler, and thus wear out more slowly.

"They must have had a mix of performance, economy and durability that they liked, but realized they couldn't achieve that and still get the emissions," he said.

Diesels in particular are known — and marketed — these days as having tremendous torque, or low-end thrust from a stop. If achieving the required emissions affected the torque, making it anemic, then "drivers are going to scratch their heads, thinking, isn't this why I got a diesel?" Mr. Brauer said.

Volkswagen was going through a difficult period even before the accusations became public on Friday. Mr. Winterkorn recently survived a power struggle with the chairman of Volkswagen's supervisory board, Ferdinand Piëch, a scion of the Porsche family who dominated the company for more than two decades before resigning in April.

Following Mr. Piëch's departure, some analysts have raised questions about whether Mr. Winterkorn would be strong enough to hold together the sprawling Volkswagen empire, which also includes Audi and Bentley luxury cars, Porsche and Lamborghini sports cars, Scania and MAN heavy trucks, and Ducati motorcycles.

Although Volkswagen recently surpassed Toyota as the world's biggest automaker measured by the number of cars sold, it is significantly less profitable than its Japanese rival and far weaker in the United States market.

A push by Volkswagen to increase sales in the United States, which included building a factory in Chattanooga, Tenn., to produce Passat sedans, has fallen short.

"For Volkswagen, it's a huge scandal," said Ferdinand Dudenhöffer, a professor at the University of Duisburg-Essen, who follows the automobile industry. "The timing is extremely unfortunate."

Professor Dudenhöffer said the case could damage all German automakers, which have

tried to build acceptance in the United States for diesel engines, a sector in which they believe they have a technological lead.

Until recently, Professor Dudenhöffer said, the United States applied stricter standards to diesel engines than those applied by European regulators. But the European authorities, concerned about the health effects of diesel pollution, have tightened standards, prompting complaints from the auto industry.

Professor Dudenhöffer said that as a result of the E.P.A. action, Mr. Winterkorn could come under pressure to resign.

"Winterkorn was already damaged," Professor Dudenhöffer said. "Now there is an accusation of illegal behavior. This story is not over."

E.P.A. officials issued the car company a notice of violation and said it had admitted to the use of a so-called defeat device.

The recall involves 4-cylinder Volkswagen and Audi vehicles from the model years 2009 to 2015.

The software was designed to conceal the cars' emission of nitrogen oxide, a pollutant that contributes to the creation of ozone and smog, which are linked to a range of health problems, including asthma attacks, other respiratory diseases and premature death.

Disengaging the pollution controls on a diesel-fueled car can yield better performance, including increased torque and acceleration.

California has issued a separate notice of violation to the company. California, the E.P.A. and the Justice Department are working together on an investigation of the allegations.

Over the next year, E.P.A. officials said, owners of the affected vehicles should expect to receive recall notices from Volkswagen, including information about how to get their cars repaired at no cost to them. The recall covers roughly 482,000 diesel passenger cars sold in the United States since 2009.

Affected diesel models include the 2009-15 Volkswagen Jetta, 2009-15 Beetle, 2009-15 Golf, 2014-15 Passat and 2009-15 Audi A3.

The American investigation could ultimately result in fines or penalties for the company. Under the terms of the Clean Air Act, the Justice Department could impose fines of as much as $37,500 for each recalled vehicle, for a possible total penalty of as much as $18 billion.

The notice of violation came days after the company promoted plans at the Frankfurt International Motor Show to introduce 20 plug-in hybrid or all-electric vehicles by 2020 as part of a campaign to reduce vehicle emissions.

Mr. Winterkorn said in his statement on Sunday that Volkswagen would "do everything necessary in order to reverse the damage this has caused."

"This matter has first priority for me, personally," he said, "and for our entire board of management."

Financial Times:

VW apologises for cheating US car exhaust emissions tests
Andy Sharman in London

The chief executive of Volkswagen has apologised and ordered an external investigation into findings that the carmaker cheated on US emissions tests to make its vehicles appear less polluting.

In a statement on Sunday, Martin Winterkorn, chief executive of the German carmaker, said the board of management took the findings "very seriously".

He added: "I personally am deeply sorry that we have broken the trust of our customers and the public. We will co-operate fully with the responsible agencies, with transparency and urgency, to clearly, openly and completely establish all of the facts of this case."

The Environmental Protection Agency on Friday said diesel variants of several VW and Audi models sold in the US over six years — including the VW Passat, Beetle and Audi A3 — had been fitted with sophisticated algorithms designed to deceive the laboratory testing regime.

The authorities ordered VW to recall 482,000 cars because of the use of so-called defeat devices — which use software to detect when the car is being tested and runs treatments to reduce nitrogen oxides. Once out on the road, the cars were discovered to produce pollutants up to 40 times the legal limits.

The discovery leaves the German carmaker — which has admitted to using the defeat devices — potentially facing billions of dollars in fines and warranty costs, possible criminal charges for executives and class-action lawsuits from US drivers.

Mr Winterkorn did not say who would be carrying out the external investigation, and the company declined to provide further details.

It was Mr Winterkorn's first formal statement on an issue that also threatens to seriously undermine its attempts to turnround its sputtering performance in the US.

Max Warburton, analyst at Bernstein Research, said: "The best case for VW is probably

still a multibillion-dollar fine, pariah status in the US with government — and possibly consumers — [and] damage to its leading position in diesel in the US."

VW now has to initiate a process to fix the cars' emissions systems, though the EPA has said the violations do not present a safety hazard and the vehicles remain legal to drive and resell. Owners of cars of models covering the 2009-2015 period do not need to take any action, the agency said.

I personally am deeply sorry that we have broken the trust of our customers and the public. We will co-operate fully with the responsible agencies, with transparency and urgency, to clearly, openly, and completely establish all of the facts of this case
- Martin Winterkorn, VW chief

In addition to the costs of the recall campaign, VW could theoretically also face fines of up to $37,500 per vehicle — a total of more than $18bn — though analysts have said VW is likely to face a much lower penalty.

The case is a rare but not unique example of this type of manipulation by the motor industry. In 1998, a group of truckmakers including Navistar, Renault and Volvo paid more than $1bn to resolve claims they installed defeat devices on heavy duty diesel engines. These devices allowed an engine to pass the emissions test, but then turn off emission controls when on the road, the EPA said at the time.

The EPA has been active in the past year, securing a record $300m settlement with Hyundai and Kia over claims the Korean affiliates overstated the fuel economy of their cars.

VW software scandal: chief apologises for breaking public trust
Martin Winterkorn orders external investigation after US regulators found cars gave inaccurate data on toxic emissions

Volkswagen has ordered an external investigation after US regulators found that the carmaker designed software for close to half a million diesel cars that gave false emissions data, its CEO said, adding he was "deeply sorry" for the violation of US rules.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Martin Winterkorn said in a statement published on Sunday by the carmaker on Sunday. "Volkswagen has ordered an external investigation of this matter."

The US Environmental Protection Agency (EPA) said on Friday the software deceived regulators measuring toxic emissions, adding that Volkswagen could face fines of up to $18bn (£11.5bn) as a result. The carmaker could face penalties of $37,500 for each car not

in compliance with clean air rules. The diesel-powered models from 2009-2015 are the VW Jetta, Beetle and Golf, the Passat model from 2014-15, and the Audi A3 from 2009 to 2015.

"We do not and will not tolerate violations of any kind of our internal rules or of the law," said Winterkorn, adding the company was fully co-operating with the relevant agencies. He gave no details on who would carry out the external investigation.

Cynthia Giles, an enforcement officer at the EPA, said on Friday that the cars in question "contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test".

"VW was concealing the facts from the EPA, the state of California and from consumers. We expected better from VW," she said. "Using a defeat device in cars to evade clean air standards is illegal and a threat to public health."

The EPA accused Volkswagen of using the device in 482,000 four-cyclinder Volkswagen and Audi diesel cars in the US since 2008. VW must recall all the cars, remove the defeat device and improve the cars' NOx emissions, which creates smog and has been linked to increased asthma attacks and other respiratory illnesses.

The feature, which the EPA called a defeat device, masks the true emissions only during testing and therefore when the cars are on the road they emit as much as 40 times the level of pollutants allowed under clean air rules meant to ensure public health is protected, said Giles.

Volkswagen suspended sales of cars containing the company's four-cylinder turbo direct injection (TDI) engine on Friday in light of the investigation. The "clean diesel" engine is commonly used in models including VW's Beetle, Golf, Jetta, Passat and the A3 luxury compact made by VW-owned Audi.

Richard Corey, executive officer of the California Air Resources Board (Carb), said on Friday: "Our goal now is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

The EPA and Carb discovered the defeat device software following independent analysis by researchers at West Virginia University, who were promoted into action by the International Council on Clean Technology, an NGO.

When confronted with the EPA and Carb's evidence, VW admitted that its cars were fitted with the defeat device.

The crackdown on Volkswagen comes as the Obama administration is attempting to cut air pollution from an array of sources, including the vehicle industry, power plants and oil and natural-gas providers. The EPA set new carbon rules for big trucks earlier this year and has told all vehicle makers they must sell light vehicles averaging 54.5 miles a gallon by 2025.

In Europe, new laws have forced manufacturers to test their cars under real world conditions and not in laboratories, helping to reduce unrealistic claims about emissions. By 2017 all new cars will have to be more stringently tested, effectively ending an era when car makers could exaggerate the performance of their machines.

UK car industry group the SMMT claims that, because of European legislation to cut tailpipe pollution, Britain's air quality is better now than it has been for centuries.

Volkswagen head apologizes after EPA accusations
By Timothy Cama - 09/20/15 01:28 PM EDT

The head of German automaker Volkswagen Group apologized Sunday after allegations surfaced that his company deliberately tried to evade United States air pollution laws.

Martin Winterkorn, the company's chief executive officer, said he was "deeply sorry" for violating the trust of customers and the public, and said that Volkswagen had ordered an external investigation into the matter.

Volkswagen faces up to $18 billion in fines for the violations under the Clean Air Act, under which the Environmental Protection Agency (EPA) sets air pollution rules for motor vehicles.

"We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly, and completely establish all of the facts of this case," Winterkorn said in a Sunday statement

"We do not and will not tolerate violations of any kind of our internal rules or of the law."

Winterkorn stopped short of admitting to the EPA's allegations.

On Friday, the EPA said it had discovered that about 482,000 diesel vehicles sold by VW and its subsidiary Audi in the United States had "defeat devices" that detect when the vehicle is undergoing an EPA emissions test and turn on equipment that controls output of nitrogen oxides to acceptable levels.

At all other times, the EPA said, the vehicles emitted more pollutants, sometimes exceeding allowable volumes by 40 times.

The agency has not yet officially charged Volkswagen with any civil or criminal penalties, nor did it order any recalls of the affected vehicles. California, which has its own emissions regulations, is also accusing the company of violating air rules.

"We at Volkswagen will do everything that must be done in order to re-establish the trust that so many people have placed in us, and we will do everything necessary in order to reverse the damage this has caused," Winterkorn said, adding that the issue is the top priority for him and the entire management team.

Volkswagen could face $18 billion penalties from EPA
WASHINGTON | BY TIMOTHY GARDNER

Volkswagen AG could face penalties up to $18 billion after being accused of designing software for diesel cars that deceives regulators measuring toxic emissions, the U.S. Environmental Protection Agency said on Friday.

"Put simply, these cars contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test," Cynthia Giles, an enforcement officer at the EPA, told reporters in a teleconference.

Volkswagen can face civil penalties of $37,500 for each vehicle not in compliance with federal clean air rules. There are 482,000 four-cylinder VW and Audi diesel cars sold since 2008 involved in the allegations. If each car involved is found to be in noncompliance, the penalty could be $18 billion, an EPA official confirmed on the teleconference.

A U.S. Volkswagen spokesman said the company "is cooperating with the investigation; we are unable to comment further at this time."

The feature in question, which the EPA called a "defeat device," masks the true emissions only during testing and therefore when the cars are on the road they emit as much as 40 times the level of pollutants allowed under clean air rules meant to ensure public health is protected, Giles said.

The EPA accused Volkswagen of using software in four-cylinder Volkswagen and Audi diesel cars from model years 2009 to 2015 made to circumvent emissions testing of certain air pollutants.

The cars are not facing recall at this time, the EPA said.

The diesel-powered vehicles involved from the 2009 to 2015 model years are the VW Jetta, VW Beetle, VW Golf and the Audi A3, as well as the VW Passat from model years 2014 and 2015.

Christian Post:
http://www.christianpost.com/news/volkswagen-to-recall-almost-500000-cars-in-the-us-over-epa-violation-145778/

Volkswagen to recall almost 500,000 cars in the US over EPA violation
BY LORRAINE CABALLERO , CHRISTIAN POST CONTRIBUTOR

Volkswagen will recall almost 500,000 vehicles released from 2009 to 2015 in the United States after the carmaker allegedly violated the law by using illegal software, which helped it go past environmental restrictions.

The Environmental Protection Agency (EPA) said Volkswagen broke the law by installing a "defeat device" in Volkswagen and Audi units with four-cylinder turbo diesel engines released from the year 2009 to 2015. Under normal driving conditions, the emission control devices installed in the said cars worked with reduced efficacy, according to the Dispatch Times.

In the wake of the violation, Volkswagen chief executive Martin Winterkorn delivered a statement apologizing to their customers and vowing to cooperate with EPA's investigation. However, he did not deny the allegations regarding the illegal software, the International Business Times reports.

"I personally am deeply sorry that we have broken the trust of our customers and the public," said Winterkorn in his statement.

Because of the notice of violation from the EPA, Volkswagen is now facing penalties amounting to more than $18 billion, or around $37,500 per unit, based on the U.S.A. federal Clean Air Act. EPA and CARB discovered the illegal software after researchers at the West Virginia University conducted an independent study in cooperation with the global Council on Clean Transportation, the report adds.

Volkswagen has been struggling to sell cars in the United States because of the rising cases of asthma and other respiratory illnesses caused by air pollutants. The diesel vehicles affected by the recall were being counted on to pull up the company's sales in the United States.

Based on the findings of the EPA, Volkswagen had included a certain algorithm in the cars' emissions software that could detect when an emission test is being conducted.

Owners of the diesel cars affected by the recall will be notified by Volkswagen by next

year, EPA said. Until Consumer Reports can "retest" the said cars, the recommended rating for the Passat, Jetta, Golf, Beetle, and Audi A3 luxury compact will remain on hold, the report relays.

AP (via Boston Globe):
https://www.bostonglobe.com/business/2015/09/20/chief-sorry-after-epa-says-firm-skirted-clean-air-law/3NNTCf2cVxUI1qYNBfMe7L/story.html

Volkswagen chief apologizes for rigging tests of emissions
By Paul Wiseman and Tom Krisher ASSOCIATED PRESS SEPTEMBER 21, 2015

WASHINGTON — The chief executive of Volkswagen apologized Sunday and VW customers said they felt duped after the Environmental Protection Agency revealed that the German automaker had skirted clean air rules by rigging emissions tests for about 500,000 diesel cars.

''I personally am deeply sorry that we have broken the trust of our customers and the public,'' Volkswagen chief Martin Winterkorn said in a statement. He said VW has ordered an investigation and promised that the company would cooperate with regulators.

On Friday, the EPA said VW used software that allowed its diesel cars to release fewer smog-causing pollutants during tests than in real-world driving conditions.

The cars, built in the last seven years, include the Audi A3, VW Jetta, Beetle, Golf, and Passat models. The agency ordered VW to fix the cars at its own expense. VW also faces fines that could add up to billions of dollars.

VW edged out Toyota to become the world's top-selling automaker in the first half of 2015. But a hit to its reputation from the emissions revelations could hamper its efforts at a sales rebound in the United States. Between 2013 and 2014, VW sales plummeted 10 percent, even as overall industry sales rose 6 percent. US buyers want SUVs, and Volkswagen doesn't have competitive vehicles to offer them.

The magazine Consumer Reports almost immediately suspended its ''recommended'' rating on the Jetta and Passat diesels until it can get recall repairs and retest the cars.

Volkswagen marketed the diesel-powered cars, which account for about 25 percent of its sales, as being better for the environment. After the EPA acted, VW withdrew ads for its

diesel cars from Youtube.com and asked dealers to stop selling 2015 diesel cars with 2.0-liter engines, according to a person familiar with the matter.

Some VW customers were furious.

Zeeshan Shah, 39, of Fulton, Md., said that he bought a Volkswagen Diesel Passat 2015 in July after he totaled his Jetta two years ago.

''The selling point" for the Diesel Passat was that the technology was so good, he said. Now, Shah plans to return the car back to the dealer to have it examined and doesn't want to buy another Volkswagen. ''Once they cheat you on this issue, what other issues can they cheat you on?'' he said. ''You don't trust them.''

John German, senior fellow at the International Council on Clean Transportation, the group that blew the whistle on VW, said it didn't expect to find any violators when it contracted with West Virginia University to test cars with diesel engines.

The council, a research group that helps governments write regulations, did the US tests in an effort to show that automakers were complying with US nitrogen oxide emissions standards, which are stricter than in other countries, he said.

The EPA said VW faces fines of up to $37,500 per vehicle for the violations, a total of more than $18 billion.

Volkswagen Halts U.S. Sales of Certain Diesel Cars
Auto maker also begins external probe after EPA accuses company of dodging emissions rules
By WILLIAM BOSTON, AMY HARDER and MIKE SPECTOR
Updated Sept. 20, 2015 8:57 p.m. ET

Volkswagen AG's crisis over allegedly cheating on U.S. emissions tests deepened, with the German auto maker halting American sales of popular diesel-powered cars and issuing a sweeping apology for violating customers' trust.

It also launched an external investigation. Shares in the company slumped more than 20% in early trading Monday in response to the crisis.

The company could face billions of dollars in fines and the crisis could further weaken Volkswagen Chief Executive Martin Winterkorn's position. He narrowly survived efforts by a major shareholder to oust him earlier this year and was passed over for the chairman's job, the company's top post, this month.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Mr. Winterkorn said in a statement issued by the company on Sunday, adding that VW is cooperating with authorities and has commissioned an external probe.

The U.S. is crucial in Volkswagen's efforts to become the world's leading auto maker by sales. The German company has built its campaign to grow in the U.S. market on a promise that its clean-diesel engines deliver better performance and low emissions. It is neck-and-neck with reigning sales leader Toyota Motor Corp. and overtook the Japanese car maker during the first half of this year. But the emissions test probes could stall its progress.

Even prior to the emissions issue, the auto maker's namesake Volkswagen brand has been battling declining sales in the U.S. market. And Audi AG, its luxury car maker, is finding it hard to catch up in the U.S. with rivals BMW AG and Daimler AG, which makes Mercedes-Benz vehicles.

On Friday, the U.S. Environmental Protection Agency and the California Air Resources Board alleged that Volkswagen used software, dubbed a "defeat device," in the cars to make diesel-powered engines appear to have lower levels of emissions than they actually did.

About 482,000 Volkswagen diesel-powered cars were affected.

The EPA probe could force Volkswagen and its Audi unit to recall thousands of vehicles that contain the company's "clean diesel" engines. The four-cylinder 2.0-liter turbo direct injection, or TDI, engine is commonly found in Volkswagen's Passat, Jetta, Golf, Beetle and in Audi's A3 luxury compact model.

A Volkswagen spokesman on Sunday said the auto maker halted the sale of all 2015 and 2016 models containing the four-cylinder 2.0 liter TDI engine. The EPA investigation affects cars sold since 2008. The company hasn't issued a recall, the spokesman said.

Realization that Volkswagen may have cheated to get better emissions results could undermine its U.S. recovery and further weaken its shares, which are down 37% from their peak on March 16, said analysts.

"There is no way to put an optimistic spin on this—this is really serious," said Max Warburton, an analyst with Bernstein Research. "The best case for VW is probably still a multi-billion dollar fine."

Consumer Reports, an influential magazine when it comes to car reviews, last week suspended "recommended" ratings on the auto maker's Jetta and Passat diesel-engine models after the EPA disclosed its allegations. Consumer Reports said the recommendations would be suspended until it can retest the vehicles once they are repaired. The magazine said it would then assess whether the cars' fuel economy worsened.

A production line at a Volkswagen plant in Wolfsburg, Germany. ENLARGE

A production line at a Volkswagen plant in Wolfsburg, Germany. PHOTO: REUTERS
Laurie Cleveland, a 54-year-old English teacher from Lowville, N.Y., said she bought a new 2015 VW Passat TDI over the Labor Day weekend. She isn't sure what to do now. She said it is her fourth Volkswagen diesel car since 2006.

"I feel like I've been deceived," she said. "I'm a person who likes to be environmentally friendly," she added.

Mr. Winterkorn on Sunday vowed to do "everything necessary" to regain public trust in the company.

"We do not and will not tolerate violation of any kind of our internal rules or of the law," he said. "This matter has first priority for me."

U.S. officials said Volkswagen violated two parts of the federal Clean Air Act and could face fines of as much as $37,500 per car, or more than $18 billion. It remained unclear whether the government would seek such an onerous penalty.

The EPA in November 2014 hit South Korean auto makers Hyundai Motor Co. and Kia Motors Corp. with a record $100 million penalty for overstating fuel-economy claims and forced the companies to cough up another $200 million in regulatory credits.

The EPA has said the vehicles remain safe and legal to drive. The agency is working with the Justice Department and an investigation is continuing.

Officials alleged that Volkswagen used software that activates full emissions controls only during testing but then reduces their effectiveness during normal driving. The result is that cars can emit nitrogen oxides at up to 40 times the allowable standard, the agency said. Diesel-powered cars are a small part of overall U.S. car and light-truck sales.

Experts say that the software enables cars to get better fuel economy at the expense of higher nitrogen-oxide emissions, which was likely one reason VW was using them, according to Margo Oge, who recently retired as director of the EPA's Office of Transportation and Air Quality after more than 30 years at the agency.

Volkswagen's apparent motivations on the emissions tests were unclear. An EPA spokeswoman has said it would be "premature to speculate on why VW did this."

A Volkswagen spokesman in Wolfsburg, Germany, on Sunday said, "We are now in the investigation phase and have no comment beyond what is in the statement that we published today."

California is separately investigating the auto maker.

The International Council on Clean Transportation, a nonprofit research organization that works with governments to cut air pollution from mobile sources, and West Virginia

University researchers uncovered Volkswagen's alleged use of defeat devices in research and testing over the last couple of years.

Volkswagen to halt U.S. sales of some 2015 diesel cars
FRANKFURT/HAMBURG | BY CHRISTOPH STEITZ AND JAN SCHWARTZ

Volkswagen (VOWG_p.DE) told U.S. dealers to halt sales of some 2015 diesel cars after regulators found software it designed for the affected vehicles gave false emissions data, the company said Sunday, announcing it had launched an investigation.

In a statement published by the carmaker on Sunday, Chief Executive Officer Martin Winterkorn said, "I personally am deeply sorry that we have broken the trust of our customers.

"Volkswagen has ordered an external investigation of this matter," he said.

The U.S. Environmental Protection Agency (EPA) said on Friday the software deceived regulators measuring toxic emissions, adding that Volkswagen could face fines of up to $18 billion as a result.

The Detroit News reported late Friday that VW dealers still had some 2015 diesel Jetta, Passat and Beetle cars for sale.

A VW representative on Sunday confirmed the partial halt of sales of the affected vehicles but did not give any numbers.

Winterkorn said, "We do not and will not tolerate violations of any kind of our internal rules or of the law," adding that the company was fully cooperating with the relevant agencies.

He gave no details on who would carry out the external investigation.

"This is not your usual recall issue, an error in calibration or even a serious safety flaw," Bernstein analysts wrote in a note on Sunday. "There is no way to put an optimistic spin on this - this is really serious."

Cynthia Giles, an enforcement officer at the EPA, said on Friday the cars in question "contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test".

The feature, which the EPA called a "defeat device," masks the true emissions only during

testing. When the cars are on the road, they emit as much as 40 times the level of pollutants allowed under clean air rules meant to ensure public health is protected, Giles said.

"We have admitted to it to the regulator. It is true. We are actively cooperating with the regulator," a Volkswagen spokesman said on Sunday.

Volkswagen could face civil penalties of $37,500 for each vehicle not in compliance with federal clean air rules. Some 482,000 four-cylinder VW and Audi diesel cars sold since 2008 are involved in the allegations.

If each car involved is found to be in noncompliance, the penalty could be $18 billion, an EPA official confirmed during the telephone conference on Friday.

Volkswagen peer Daimler, meanwhile, signaled it may not be subject to the same violation.

"I have a rough idea of what is happening and that it does not apply to us," Daimler Chief Executive Dieter Zetsche said on Sunday at an event in Hamburg.

"But it is much too early to make a final statement on this," he added.

USA Today:

Volkswagen issues sales halt; CEO apologizes on emissions cheating
Nathan Bomey, USA TODAY 8:02 a.m. EDT September 21, 2015

Volkswagen has admitted cheating U.S. diesel emissions tests, sending company shares plunging as much as 23 percent in Frankfurt and potentially leaving the company open to billions of dollars in fines. Bloomberg

Martin Winterkorn ordered an external investigation after the EPA disclosed the violations.

Volkswagen's CEO said he is "deeply sorry" for violating U.S. emissions standards and ordered an external investigation Sunday, two days after the Environmental Protection Agency (EPA) accused the automaker of purposefully manipulating emissions tests for almost 500,000 vehicles.

The German automaker ordered its U.S. dealerships to stop selling cars impacted by the probe until its engineers can deliver a fix.

The EPA accused Volkswagen of installing software on 482,000 diesel cars in the USA that allowed it to cheat emissions tests, potentially exposing people to harmful pollutants at levels of 40 times the acceptable standard and respiratory conditions such as asthma.

"I personally am deeply sorry that we have broken the trust of our customers and the public," Martin Winterkorn, Volkswagen's CEO, said in a statement. "We will cooperate fully with the responsible agencies, with transparency and urgency, to clearly, openly and completely establish all of the facts of this case." Winterkorn pledged to regain the public's trust.

The violations could expose Volkswagen — the world's largest vehicle manufacturer through the first six months of 2015 — to up to $18 billion in federal fines if the EPA assesses the maximum possible penalty of $37,500 per vehicle.

The violations could invite charges of false marketing by regulators, a vehicle recall and payment to car owners, either voluntarily or through lawsuits. Volkswagen advertised the cars under the "Clean Diesel" moniker.

The state of California is investigating the emissions violations.

"We do not and will not tolerate violations of any kind of our internal rules or of the law," Winterkorn said. The company's board takes the allegations "very seriously," he said.

The EPA accused the German automaker of adopting what it called a "defeat device" to trick U.S. regulators into believing its cars met Clean Air Act standards for nitrogen oxides. Volkswagen admitted to investigators it had installed the defeat device, the EPA said.

The EPA said impacted cars include the 2009 to 2014 Volkswagen Jetta, Beetle and Golf, the 2014 and 2015 Volkswagen Passat and the 2009 to 2015 Audi A3.

Volkswagen told dealers they cannot sell the 4-cylinder diesel versions of those cars until a fix is available, Volkswagen spokesman Mario Guerreiro said Sunday.

The sales halt could put a significant dent in the company's September sales performance. About 20% of Volkswagen's vehicle sales are diesel engines, said AutoPacific analyst Dave Sullivan.

"It totally goes against all of the marketing they have had of a clean diesel," Sullivan said of the violations. "That's one of the biggest selling points for Volkswagen."

"The trust of our customers and the public is and continues to be our most important asset," Winterkorn said Sunday. "We at Volkswagen will do everything that must be done in order to re-establish the trust that so many people have placed in us, and we will do everything necessary in order to reverse the damage this has caused. This matter has first priority for me, personally, and for our entire Board of Management."

Regulators order Volkswagen recalls over device used to trick smog tests
BY DALE KASLER

In a joint probe with California air regulators, the federal government Friday told Volkswagen to recall 480,000 diesel-fuel cars, charging the automaker with equipping the cars with software designed to circumvent pollution limits.

The U.S. Environmental Protection Agency and California Air Resources Board sent notices to the German automaker over its alleged use of something called a "defeat device," a piece of software that controls emissions during smog tests but not when the vehicles are actually on the road.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, assistant EPA administrator, in a prepared statement. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules."

The EPA sent Volkswagen a "notice of violation" and told car owners they can expect a recall notice. The agency said all repairs will be done at Volkswagen's expense. It added that the cars are safe to drive. The EPA has the authority to order automotive recalls.

Stanley Young, a spokesman for the ARB, said the federal and state agencies were first notified of the problem by independent researchers at West Virginia University and the International Council on Clean Transportation. Months of followup testing, including tests at an ARB lab in El Monte, confirmed the analyses.

Volkswagen officials in early September "admitted to CARB and EPA staff that these vehicles were designed and manufactured with a defeat device," according to an enforcement letter the California agency sent Friday to Volkswagen officials.

Young said "our major goal is to ensure that these cars come into compliance, that they're the same in the real world as they are on the test bench." The automaker eventually could face fines or other enforcement actions, he said.

The agencies plan to "dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action," said Richard Corey, executive officer of ARB, in a prepared statement.

The EPA said the recall affects VW Jettas, Beetles, Golfs and Audi A3s made in the 2009 to 2015 model years. It also covers VW Passats made in the 2014 and 2015 model years. Only

diesel cars are affected. Young said ARB believes there are as many as 50,000 affected vehicles on the road in California.

Under the federal Clean Air Act, California has the authority to set its own regulatory standards for car emissions.

Volkswagen of America spokesman Darryll Harrison Jr. said the company is cooperating with the federal and state agencies but had no further comment.

Volkswagen's Game of Make-Believe
The company inserted a device into almost 500,000 cars meant to trick emissions testing, the EPA says.
ROBINSON MEYER

One of the great lessons of the pioneering computer scientist Alan Turing is this: Computers are only pretending machines. Software is always just imitating something else.

Volkswagen seems to have taken this maxim to new heights. The Environmental Protection Agency alleges that the company installed "defeat devices" in its four-cylinder Volkswagen and Audi-brand diesel cars from 2009 to 2015.

These devices, essentially, let the cars pretend to not break the law. The software could sense when the car was undergoing emissions testing and activate its pollution-control systems accordingly. When the car was being driven during normal use, these systems largely did not activate—making the car a much heavier polluter in real-life than it looked on paper.

With those systems deactivated, the car's emissions violated the Clean Air Act and California's state pollution-control regulation.

"Using a defeat device in cars to evade clean-air standards is illegal and a threat to public health," said Cynthia Giles, assistant administrator for the EPA's Office of Enforcement and Compliance Assurance, in a statement.

There are almost 500,000 vehicles on American roads with the devices installed, according

to the EPA. Volkswagen must now pay to repair the emissions systems in affected cars. The government may also fine the company as much as $18 billion.

The device was discovered by researchers at West Virginia University, who notified the EPA and California state authorities. The two authorities investigated further, and after demanding "an explanation for the identified emission problems, Volkswagen admitted that the cars contained defeat devices," said a statement from the agency.

I reached out to Volkswagen for comment and haven't heard back yet. The Times reports that the company is complying with investigations.

Volkswagen urged to recall cars for allegedly cheating emissions test
BY CHRIS PERKINS

Automakers are under intense pressure to meet emissions regulations put in place by the world's governments. Volkswagen allegedly had a slightly different solution.

The U.S. Environmental Protection Agency (EPA) ordered a recall of almost 500,000 Volkswagen and Audi vehicles equipped with four-cylinder diesel engines, for software designed to sidestep emissions regulations, reports the New York Times.

In total, 482,000 vehicles are being implicated, including the 2009-2015 Volkswagen Golf, Beetle, Jetta and Beetle, the 2014-2015 Volkswagen Passat and the 2009-2015 Audi A3. The cars were possibly installed with a "defeat device," a piece of software designed to detect when the car is undergoing emissions testing and turn on all of the car's emissions control systems then. In normal driving, the systems would turn off, causing 40 times larger nitrogen oxide emissions, according to the E.P.A.

Nitrogen oxide is a major contributor to smog, which can lead to increased respiratory problems and premature death.

The installation of this software is in violation of the Clean Air Act, and as such, the E.P.A, the State of California and the Department of Justice will launch an investigation. The installation of this software is in violation of the Clean Air Act, and as such, the E.P.A, the State of California and the Department of Justice will launch an investigation.

U.S. regulators hope that this recall will send a message to automakers to not develop software to skirt regulations. Last November, Hyundai and Kia were fined $100 million for violating the Clean Air Act. The two companies inflated their fuel economy figures for their 2012 vehicles.

The likely reason why Volkswagen could go the trouble to develop and use software like this is to boost performance; emissions control equipment tends to suck power out of an engine.

Researchers from West Virginia University, working with the International Council on Clean Transportation, discovered the software, according to the EPA's press release.

"Volkswagen Group of America, Inc., Volkswagen AG and Audi AG received today notice from the US Environmental Protection Agency, US Department of Justice and the California Air Resources Board of an investigation related to certain emissions compliance matters. VW is cooperating with the investigation; we are unable to comment further at this time," said a representative for Volkswagen.

A representative for the EPA wasn't immediately available for comment.

It's unclear if this issue only pertains to U.S. model Volkswagens and Audis equipped with four-cylinder diesels, or their world-market counterparts as well.

A report from Jalopnik notes that all of Volkswagen's ads for its diesel models have been deleted from YouTube, apparently at the company's request.

Why the EPA is forcing Volkswagen to recall nearly 500,000 cars
Volkswagen AG, the German car manufacturer, is under investigation by California and US emissions regulators for allegedly circumventing emission tests with a new device.
By Corey Fedde, Staff SEPTEMBER 18, 2015

Volkswagen AG is under investigation for circumventing clean air rules.

German automotive company Volkswagen AG is under investigation by California and US

environmental regulators. The US Environmental Protection Agency told Reuters Volkswagen allegedly used software to circumvent emissions testing of specific air pollutants.

"Put simply, these cars contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test," Cynthia Giles, an EPA enforcement officer, told Reuters via teleconference.

The feature, known as a "defeat device," is allegedly present in 4 cylinder Volkswagen and Audi vehicles from 2009-2015, which total nearly 500,000 vehicles. The device is programmed to detect when the car is undergoing an emissions test and turn on the full emissions controls. The device then turns the emission controls off during normal driving. The result being far more pollution than the company reported, the EPA told The New York Times.

The pollutant the "defeat device" is designed to conceal, nitrogen oxide, has been linked by public health officials to variety of health problems, including asthma.

The 500,000 diesel vehicle models affected include 2009-2015 Volkswagen Jettas, Beetles, Golfs, Passats, and Audi A3s.

The violation and investigation belie a growing trend in more aggressive environmental enforcement from federal regulators. In November 2014, the administration announced its largest ever penalty for a violation of the Clean Air Act on Korean automakers Hyundai Motor and Kia Motors. The fine involved a $300 million settlement for overstating vehicle fuel-economy standards on more than 1 million cars.

According to The New York Times, analysts say the crackdown is meant to send a clear message to automakers that circumventing federal rules will not be tolerated.

California, the EPA, and the Justice Department are working together on the investigation.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health. Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. E.P.A. will continue to investigate these very serious violations," Ms. Giles told the Times.

This report includes material from Reuters.

Volkswagen could face $18 billion penalties from EPA
WASHINGTON | BY TIMOTHY GARDNER

Volkswagen AG (VOWG_p.DE) could face penalties up to $18 billion after being accused of designing software for diesel cars that deceives regulators measuring toxic emissions, the U.S. Environmental Protection Agency said on Friday.

"Put simply, these cars contained software that turns off emissions controls when driving normally and turns them on when the car is undergoing an emissions test," Cynthia Giles, an enforcement officer at the EPA, told reporters in a teleconference.

Volkswagen can face civil penalties of $37,500 for each vehicle not in compliance with federal clean air rules. There are 482,000 four-cylinder VW and Audi diesel cars sold since 2008 involved in the allegations. If each car involved is found to be in noncompliance, the penalty could be $18 billion, an EPA official confirmed on the teleconference.

A U.S. Volkswagen spokesman said the company "is cooperating with the investigation; we are unable to comment further at this time."

The feature in question, which the EPA called a "defeat device," masks the true emissions only during testing and therefore when the cars are on the road they emit as much as 40 times the level of pollutants allowed under clean air rules meant to ensure public health is protected, Giles said.

The EPA accused Volkswagen of using software in four-cylinder Volkswagen and Audi diesel cars from model years 2009 to 2015 made to circumvent emissions testing of certain air pollutants.

The cars are not facing recall at this time, the EPA said.

The diesel-powered vehicles involved from the 2009 to 2015 model years are the VW Jetta, VW Beetle, VW Golf and the Audi A3, as well as the VW Passat from model years 2014 and 2015.

Feds accuse VW of going around federal emissions standards
By Devin Henry - 09/18/15 12:50 PM EDT

The Environmental Protection Agency (EPA) is accusing Volkswagen of looking to circumvent federal air pollutant emission standards for the last six years.

EPA officials alleged Friday that about 482,000 VW vehicles sold since 2008 violate the Clean Air Act due to software installed on the vehicles that turns off required air pollution protections.

Janet McCabe, an acting assistant administrator, said the EPA "intends to hold VW responsible to recall the vehicles" and fix the emissions problem. The company could face up to an $18 billion fine for the violations.

The EPA issued VW a Clean Air Act violation notice Friday, alleging it used a software algorithm on certain vehicles that would turn on emission controls only when they undergo official emissions testing.

This "defeat device," the EPA said, would switch off those controls during normal operation, which means the vehicles could emit up to 40 times the amount of nitrogen oxide allowed under federal air pollution standards.

"These violations are very serious … not only because they result in excess emissions, but also because VW was concealing the fact from EPA, the state of California and from consumers," Assistant Administrator Cynthia Giles said. "We expected better from VW."

Federal law requires manufacturers to certify to the EPA that their cars meet emissions standards before selling their vehicles in the U.S. Cars with defeat devices cannot be certified, the EPA said.

A VW statement said only that the company had received the violation notice and is cooperating with the investigation.

The EPA and the California Air Resources Board discovered the defeat device during an analysis at West Virginia State University, the EPA said. Officials said their investigation into the incident is ongoing and wouldn't give many more details about how it developed or what the outcome might be.

The agency is not ordering a recall or announcing penalties at the moment, and officials said the cars are safe and legal to drive. The Friday announcement, Giles said, was meant to "inform the public right away and to put VW on notice of our continuing investigation."

The EPA said the announcement covers VW Jettas, Beetles, Golfs and Audi A3s with

model years between 2009 and 2015, as well as the VW Passat with model years 2014 and 2015.

Volkswagen ordered to recall almost a half-million cars over emissions trick
by Benjamin Snyder

The Environmental Protection Agency is ordering Volkswagen to recall nearly a half-million cars after the company allegedly used a computer software trick to make the cars seem more environmentally friendly during state emissions tests.

The VW models involved include the diesel versions of the following models: The 2009-15 Volkswagen Jetta, the 2009–15 Beetle, the 2009–15 Golf, the 2014-15 Passat and the 2009-15 Audi A3. The recall affects 482,000 vehicles in total.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, Assistant Administrator for the Office of Enforcement and Compliance Assurance, in a statement. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

"Volkswagen Group of America, Inc., Volkswagen AG and Audi AG received today notice from the US Environmental Protection Agency, US Department of Justice and the California Air Resources Board of an investigation related to certain emissions compliance matters," Volkswagen says. "VW is cooperating with the investigation; we are unable to comment further at this time."

Volkswagen Used Illegal Software to Cheat Emissions Tests: EPA
By Stephen Elmer Sep 18, 2015

Volkswagen may be forced to recall almost 500,000 diesel passenger cars after an investigation revealed illegal software was allowing the vehicles to pass government emissions standards.

A software algorithm, known as a defeat device, used on roughly 482,000 Volkswagen vehicles with four-cylinder diesel engines is able to detect when the car is undergoing official emissions testing, and will activate full emissions controls only during the test.

The EPA says that this results in cars that meet emissions standards while being tested, but emit 40 percent more nitrogen oxides while driving.

Independent analysis at West Virginia University uncovered the defeat devices. After being questioned by the EPA and CARB, Volkswagen admitted that its cars did contain defeat devices.

The EPA says "it is incumbent" on Volkswagen to initiate a recall fix for all the affected cars, although they note that these vehicles are still safe to drive and do not present a safety hazard at this time.

Volkswagen may be liable for civil penalties over the findings, which could total up to $18 billion if the EPA leverages its maximum find of $37,500 per vehicles.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, Assistant Administrator for the Office of Enforcement and Compliance Assurance. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

Models affected by the issue include the 2009-2015 Volkswagen Jetta, Beetle and Gold. The 2009-2015 Audi A3 is also affected, along with the 2014-2015 Passat.

Volkswagen acknowledged that it has received notice of the investigation. "VW is cooperating with the investigation; we are unable to comment further at this time," said the brand.

EPA: Volkswagen used 'defeat device' to circumvent air pollution controls
By Joby Warrick September 18 at 1:04 PM

The Environmental Protection Agency on Friday accused Volkswagen of installing a software "defeat device" that circumvented pollution controls on nearly a half-million Volkswagens and Audis.

The regulatory agency filed a notice of violation against the German automaker, saying the

company deliberately cheated on clean-air rules by installing the software of five of its models since 2008. An EPA statement warned of possible civil penalties and hinted of a future possible recall, saying it was "incumbent on Volkswagen to initiate the process" to fix the affected cars' emissions systems.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, the EPA's assistant administrator for EPA's Office of Enforcement and Compliance Assurance.

EPA officials, in a joint probe with California's regulatory agency, determined that Volkswagen had inserted a sophisticated algorithm in the cars' emissions software that could detect when a vehicle was undergoing emissions testing. The software, which the EPA called a "defeat device," would turn on full emissions controls during testing, and switch them off again under normal driving conditions.

As a result, the cars emitted far more pollution–up to 40 times the federal standard for the pollutant known as NOx, a component in urban smog, the EPA said.

The software was installed in Volkwagen's Golfs, Jettas and Beetles and Audi A3s beginning in the model year 2009, and in Volkswagen's Passat models beginning in 2014. EPA officials said no action was required by owners of the car, but they suggested that Volkswagen would be compelled to address the problem.

"Our goal now is to ensure that the affected cars are brought into compliance, said Richard Corey, the executive officer for California's Air Resources Board." He said federal and state agencies intended to "dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

EPA Accuses Volkswagen of Dodging Emissions Rules
Agency says German auto maker circumvented air-pollution standards with software
By AMY HARDER

WASHINGTON—The U.S. Environmental Protection Agency issued a notice on Friday alleging that Volkswagen AG circumvented air-pollution standards with software installed on nearly a half million cars sold in the U.S. since 2008.

Officials said Volkswagen could face penalties of up to $37,500 per vehicle, or a total of more than $18 billion, though it remained unclear whether the government would eventually levy such a large penalty. Officials said the German auto maker violated the federal Clean Air Act.

The agency said that owners of these cars don't need to take any action right now and that while the cars have emissions exceeding federal standards, "these violations do not present a safety hazard and the cars remain legal to drive," according to the EPA.

Officials said a recall hasn't been announced and an investigation continues. They plan to at some point order Volkswagen to fix the vehicles, officials said.

Top EPA officials made the announcement alongside the California Air Resources Board, which is separately investigating the alleged use of the software, which EPA describes as a "defeat device." The software reduces the effectiveness of a car's emission control system during normal driving conditions and enables the car to emit nitrogen oxides at up to 40 times the allowable standard, according to the EPA.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, Assistant Administrator for the Office of Enforcement and Compliance at the EPA.

"Volkswagen Group of America Inc., Volkswagen AG and Audi AG received today notice from the U.S. Environmental Protection Agency, U.S. Department of Justice and the California Air Resources Board of an investigation related to certain emissions compliance matters," Volkswagen said in a statement. "VW is cooperating with the investigation; we are unable to comment further at this time."

EPA said that its allegations cover roughly 482,000 diesel passenger cars with model years between 2009 and 2015 and sold in the U.S. since 2008. They include the following models: the Jetta, Beetle, Audi A3, Golf and Passat.

The Clean Air Act requires vehicle manufacturers to certify to EPA that their products meet federal air-pollution standards. EPA said Friday that by making and selling vehicles with the "defeat device" software, Volkswagen was violating two parts of the Clean Air Act.

device-to-skirt-emissions-rules-epa-says

Volkswagen Used 'Defeat Device' To Skirt Emissions Rules, EPA Says
BILL CHAPPELL

Saying Volkswagen violated the Clean Air Act, the Environmental Protection Agency says the company's diesel-powered cars have sophisticated software that detects emissions testing – and "turns full emissions controls on only during the test."

Installed on four-cylinder cars, the software, which the EPA calls a "defeat device" that's meant to trick official tests, allowed diesel Jettas, Beetles, and other cars to "emit up to 40 times more pollution" than allowed under U.S. emission standards.

The agency says that after the carmaker was confronted with emission test results this month, it admitted that the cars contain defeat devices.

Volkswagen must now fix the cars' emissions control systems, the agency says, adding that Volkswagen could be liable for civil penalties and other punishment. The cars in question are popular Volkswagen and Audi models that were made from 2009 to this year.

The affected diesel cars include:

- Jetta (Model Years 2009 – 2015)
- Beetle (Model Years 2009 – 2015)
- Audi A3 (Model Years 2009 – 2015)
- Golf (Model Years 2009 – 2015)
- Passat (Model Years 2014-2015)

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, assistant administrator for the Office of Enforcement and Compliance Assurance.

The Verge:
http://www.theverge.com/2015/9/18/9352757/epa-volkswagen-recall-emissions

Volkswagen ordered to recall 500,000 cars for gaming emissions testing
By Colin Lecher

The federal government has ordered Volkswagen to recall almost 500,000 vehicles, saying the company unlawfully used special software to get around missions regulations.

VOLKSWAGEN ALLEGEDLY USED A "DEFEAT DEVICE."

Volkswagen allegedly used a so-called "defeat device" on certain models made in the past six years. The device works by only turning on emissions control when undergoing

emissions testing, but not when the car is actually being driven normally and pollution is at its peak. "This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the standard," the EPA said in a statement.

Using such a device is a violation of the Clean Air Act, which, as The New York Times points out, the EPA has been increasingly cracking down on. In November, the agency hit Hyundai and Kia with a record $100 million fine for violations under the act.

The cars affected by the recall include the 2009 to 2015 Jetta, Beetle, Golf, and Audi A3. The 2014 and 2015 Passat is also included. According to the EPA, that adds up to 482,000 cars.

Jalopnik:
http://jalopnik.com/epa-orders-volkswagen-to-recall-482-000-diesel-cars-for-1731665972

EPA Orders Volkswagen To Recall 482,000 Diesel Cars For Cheating On Emissions
Patrick George

The New York Times reports Volkswagen has been ordered by the Environmental Protection Agency to recall 482,000 diesel cars in the U.S. over software they say was intentionally designed to circumvent smog regulations.

The cars, all diesels from 2009 to 2015, have a “defeat device” programmed to detect when the car is undergoing official emissions testing that only then turns on the full emissions control systems, the Times reports.

These controls are turned off in other situations, leading to far greater emissions than VW let on — which is against the law. The devices were designed to conceal nitrogen oxide emissions.

It’s not immediately clear why VW had such a system on these cars, how the system detected official testing versus normal driving, or if the cars operated differently in normal driving when the defeat device was off. What effect did reducing NOx emissions have on fuel economy or performance?

“Using a defeat device in cars to evade clean air standards is illegal and a threat to public health,” said Cynthia Giles, the E.P.A.’s assistant administrator for the Office of Enforcement and Compliance. “Working closely with the California Air Resources Board, E.P.A. is committed to making sure that all automakers play by the same rules. E.P.A. will continue to investigate these very serious violations.”
The state of California and the Justice Department are also investigating the violation, the paper reports.

The vehicles affected are the 2009-2015 diesel Jetta, Beetle, Golf, Passat and Audi A3.

More on this as we get it.

EPA: Volkswagen used software to skirt emissions rules
By Greg Gardner

The U.S. Environmental Protection Agency and California are accusing Volkswagen of violating the Clean Air Act by using software that allows hundred of thousands of VW and Audi diesel-powered cars to get around emission standards.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, EPA assistant administrator for enforcement and compliance assurance. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

The agency's notice of violation covers about 482,000 diesel cars sold between 2009 and 2015 model years.

Affected diesel models include:

Jetta (model years 2009 – 2015)
Beetle (model years 2009 – 2015)
Audi A3 (model years 2009 – 2015)
Golf (model years 2009 – 2015)
Passat (model years 2014-2015)

California is separately issuing an In-Use Compliance letter to Volkswagen, and EPA and the California Air Resources Board (CARB) have both initiated investigations based on Volkswagen's alleged actions.

"Working with U.S. EPA we are taking this important step to protect public health thanks to the dogged investigations by our laboratory scientists and staff," said CARB executive officer Richard Corey. "Our goal is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to

cheat on clean air rules, and to take appropriate further action."

The federal and California regulators say Volkswagen used a sophisticated software algorithm on certain Volkswagen vehicles that detects when the car is undergoing official emissions testing and turns full emissions controls on only during the test. The effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations.

As a result the cars met emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the permissible standard. The software produced by Volkswagen is a "defeat device," as defined by the Clean Air Act.

Corey said testing groups in Europe found information that indicated Volkswagen may have manipulated its emission tests and told California regulators about their suspicions.

NOx pollution contributes to nitrogen dioxide, ground-level ozone and fine particulate matter. Exposure to these pollutants has been linked with a range of serious health effects, including increased asthma attacks and other respiratory illnesses that can be serious enough to send people to the hospital. Exposure to ozone and particulate matter have also been associated with premature death due to respiratory-related or cardiovascular-related effects. Children, elderly people and those with pre-existing respiratory disease are particularly at risk for health effects of these pollutants.

The Clean Air Act requires vehicle manufacturers to certify to EPA that their products will meet applicable federal emission standards to control air pollution, and every vehicle sold in the U.S. must be covered by an EPA-issued certificate of conformity. Motor vehicles equipped with defeat devices, which reduce the effectiveness of the emission control system during normal driving conditions, cannot be certified. By making and selling vehicles with defeat devices that allowed for higher levels of air emissions than were certified to EPA, Volkswagen violated two important provisions of the Clean Air Act.

EPA and CARB uncovered the defeat device software after independent analysis by researchers at West Virginia University, working with the International Council on Clean Transportation, a non-governmental organization. The researchers raised questions about emissions levels, and the agencies began further investigations into the issue. In September, after EPA and CARB demanded an explanation for the emission problems, Volkswagen admitted that the cars contained defeat devices.

VW may be liable for civil penalties of up to $37,500 per vehicle found to be violating the standard, or potentially more than $18 billion.

It is incumbent upon Volkswagen to initiate the process that will fix the cars' emissions systems. Car owners should know that although these vehicles have emissions exceeding standards, these violations do not present a safety hazard and the cars remain legal to drive and resell. Owners of cars of these models and years do not need to take any action at this

time.

Wired:

EPA ACCUSES VOLKSWAGEN OF CHEATING EMISSIONS TESTING ON 482,000 CARS
Alex Davies

THE EPA IS accusing Volkswagen of illegally using software to cheat emissions standards, allowing the German automaker to sell half a million cars that produce smog at 40 times the legal limit.

In a notice of violation of the Clean Air Act sent to Volkswagen AG, Audi AG, and Volkswagen Group of America, Inc today, the EPA said diesel-powered VW cars used a "defeat device," a kind of "a sophisticated software algorithm [that] detects when the car is undergoing official emissions testing, and turns full emissions controls on only during the test. The effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations."

The accusation applies to 482,000 diesel-powered, four-cyclinder Jetta, Beetle, Audi A3, Golf, and Passat cars sold between 2008 and 2015 in the US. The news comes as the Frankfurt motor show, one of the biggest events of the year for the automaker, opens to the press. VW will be required to fix the problem, at no cost to car owners.

The Week:
http://www.theweek.com/speedreads/578080/epa-catches-volkswagen-blatantly-cheating-smog-tests

EPA catches Volkswagen blatantly cheating on smog tests
Jeva Lange

Almost half a million Volkswagen cars, including recent diesel models of Jettas, Beetles, Audi A3s, Golfs, and Passats, may be recalled in an enormous crackdown on the German carmaker's alleged blatant circumvention of smog standards, The New York Times reports.

The Environmental Protection Agency has demanded that the cars be recalled, and specifically accused Volkswagen of installing software, called a "defeat device," in their cars that basically just lies about what a car's emissions are during tests:

The device is programmed to detect when the car is undergoing official emissions testing, and to only turn on full emissions control systems during that testing. Those controls are turned off during normal driving situations, when the vehicles pollute far more heavily than

reported by the manufacturer, the E.P.A. said. [The New York Times]

Car emissions contain nitrogen oxide, which creates smog, as well as pollutants that cause asthma.

Volkswagen is accused of sidestepping emissions rules, 'cheating' pollution tests
By JERRY HIRSCH

Federal and California environmental regulators accused Volkswagen of using software that "cheats" pollution testing in nearly 500,000 recent model VWs and Audis by circumventing emission standards in its diesel cars.

The German automaker will eventually have to recall all of the vehicles and change the emissions systems at its own expense, regulators said. Additionally it could face a fine of about $18 billion, or $35,500 per car, federal environmental officials said.

The Environmental Protection Agency on Friday issued the German automaker a "notice of violation" of the Clean Air Act for both VW models and the company's Audi luxury brand. It covers models equipped with four-cylinder diesel engines. The California Air Resources Board issued a similar letter.

Volkswagen and Audi vehicles from model years 2009-2015 have the software, which uses an algorithm that detects when the vehicle is undergoing pollution tests and changes the way it performs from when it is being driven on the open road.

It "is illegal and a threat to public health," said Cynthia Giles, assistant administrator for the Office of Enforcement and Compliance Assurance. "EPA is committed to making sure that all automakers play by the same rules."

"We expected better from VW," Giles said.

Air Resources Board Executive Officer Richard Corey said the California agency wants to bring the cars "into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

Volkswagen said it is cooperating with the investigation.

"We are unable to comment further at this time," the company said in a statement.

The affected diesel models include: Jetta (model years 2009 – 2015,) Beetle (model years 2009 – 2015,) Audi A3 (model years 2009 – 2015,) Golf (model years 2009 – 2015) and Passat (model years 2014-2015.)

Volkswagen And Audi Recall: 500,000 Cars Broke Environmental Rules, White House Says
By Christopher Harress

The Obama administration Friday forced car manufacturer Volkswagen to recall nearly 500,000 cars after it was discovered the German automaker had fitted its vehicles with special technology that can beat environmental tests for reducing smog, according to a new report.

The recall, which was imposed after an investigation by the Environmental Protection Agency, is expected to affect four-cylinder Volkswagen and Audi cars that were manufactured between 2009 and 2015.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," Cynthia Giles, the E.P.A.'s assistant administrator for the Office of Enforcement and Compliance, told the New York Times.

"Working closely with the California Air Resources Board, E.P.A. is committed to making sure that all automakers play by the same rules. E.P.A. will continue to investigate these very serious violations."

EPA: 482K VW diesel vehicles violated emissions rules
David Shepardson

Washington — The Environmental Protection Agency and the state of California said Volkswagen AG violated federal law by allowing 482,000 diesel VW and Audi cars sold since 2009 to evade emissions requirements using sophisticated software.

The announcement is a big setback to the German automaker that has made diesel vehicles a big part of its U.S. strategy. VW could face fines or criminal prosecution and must immediately prevent those vehicles from being able to defeat emissions rules.

VW concealed facts but has now admitted wrongdoing, said Cynthia Giles, assistant administrator for the Office of Enforcement and Compliance Assurance. "We expected better from VW," she said.

The agencies allege that four-cylinder Volkswagen and Audi diesel cars from model years 2009-2015 include software that circumvents EPA emissions standards for certain air pollutants. California is separately issuing an In-Use Compliance letter to Volkswagen, and EPA and the California Air Resources Board have initiated investigations based on Volkswagen's alleged actions.

EPA said the vehicles software "detects when the car is undergoing official emissions testing, and turns full emissions controls on only during the test." The vehicles include diesel Golf, Jetta, Sportwagen, Beetle and Audi A3 vehicles built from 2009-2015.

EPA said "the effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations. This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the standard. The software produced by Volkswagen is a 'defeat device,' as defined by the Clean Air Act."

NOx pollution contributes to nitrogen dioxide, ground-level ozone, and fine particulate matter. EPA said exposure has been linked to serious health issues, including increased asthma attacks and other respiratory illnesses that can be serious enough to send people to the hospital. "Exposure to ozone and particulate matter have also been associated with premature death due to respiratory-related or cardiovascular-related effects. Children, the elderly, and people with pre-existing respiratory disease are particularly at risk for health effects of these pollutants," EPA said.

This is the latest example of automakers not following the miles per gallon and emissions rules.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Giles. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

The Clean Air Act requires vehicle manufacturers to certify to EPA that their products will

meet applicable federal emission standards to control air pollution, and every vehicle sold in the U.S. must be covered by an EPA-issued certificate of conformity. Motor vehicles equipped with defeat devices, which reduce the effectiveness of the emission control system during normal driving conditions, cannot be certified.

"Working with U.S. EPA we are taking this important step to protect public health thanks to the dogged investigations by our laboratory scientists and staff," said Air Resources Board Executive Officer Richard Corey. "Our goal now is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

The issue first came to the attention of the agencies in 2014 after independent analysis by researchers at West Virginia University, working with the International Council on Clean Transportation, a non-governmental organization, raised questions about emissions levels, and the agencies began further investigations into the issue.

In September, after EPA and CARB demanded an explanation for the identified emission problems, Volkswagen admitted that the cars contained defeat devices, the agencies said.

EPA said VW must recall the vehicles. EPA said "owners should know that although these vehicles have emissions exceeding standards, these violations do not present a safety hazard and the cars remain legal to drive and resell. Owners of cars of these models and years do not need to take any action at this time."

EPA Says VW Intentionally Violates Clean Air Standards
By MATTHEW DALY, ASSOCIATED PRESS WASHINGTON — Sep 18, 2015, 12:42 PM ET

The Environmental Protection Agency says nearly 500,000 Volkswagen and Audi diesel cars built in the past seven year are intentionally violating clean air standards by using software that evades EPA emissions standards.

The EPA says the cars include a device programmed to detect when the car is undergoing official emissions testing. The cars only turn on full emissions control systems during that testing. The EPA says the controls are turned off during normal driving situations.

The EPA called the company's use of the device illegal and a threat to public health.

The EPA called on VW to fix the cars' emissions systems, but said car owners do not need to take any immediate action.

VW said in a statement it is cooperating with the investigation.

Bloomberg:
http://www.bloomberg.com/news/articles/2015-09-18/epa-says-volkswagon-software-circumvented-car-emissions-testing

EPA Says Volkswagen Circumvented Car Emissions Tests
Jeff Plungis

Volkswagen AG sold diesel cars with software that circumvented U.S. emissions standards for air pollution, the Environmental Protection Agency said.

The company sold Volkswagen and Audi brand cars from model years 2009-2015 that contained a "sophisticated software algorithm" that detects when the car is undergoing official emissions testing, and turns on full emissions control, the agency said. During normal driving times, the systems don't operate fully, regulators said.

The potential fine is $37,500 per vehicle and 482,000 autos are part of the case, yielding a potential fine of more than $18 billion, Cynthia Giles, EPA assistant administrator for enforcement and compliance, said on a phone call with reporters Friday.

California is also investigating the claims.

Volkswagen said in a statement it is cooperating with the investigation and unable to comment further.

Business Insider:
http://www.businessinsider.com/vw-told-to-recall-500000-cars-after-us-government-accuses-it-of-dodging-clean-air-standards-2015-9

VW told to recall 500,000 cars after US government accuses it of dodging clean air standards
Benjamin Zhang

The Environmental Protection Agency has ordered the recall of 500,000 Volkswagen cars.

According to Coral Davenport of the New York Times, the EPA accused VW of using hidden software — called a "defeat device" — to dodge clean air standard during emissions testing.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," assistant administrator for the Office of Enforcement and Compliance Assurance said Cynthia Giles said in a statement.

"Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

In response to the recall, Volkswagen issued the following statement to Business Insider.

"Volkswagen Group of America, Inc., Volkswagen AG and Audi AG received today notice from the US Environmental Protection Agency, US Department of Justice and the California Air Resources Board of an investigation related to certain emissions compliance matters. VW is cooperating with the investigation; we are unable to comment further at this time."

The recall affects 482,000 diesel powered cars sold in the US since 2008. They include:

Volkswagen Jetta TDI: 2009-20015
Volkswagen Beetle TDI: 2009-2015
Audi A3 TDI: 2009-2015
Volkswagen Golf TDI: 2009-2015
Volkswagen Passat TDI: 2014-2015

This story is developing. We will update when more information is available.

EPA says Audi, VW cheating on emissions
By JOHN SICILIANO

The Environmental Protection Agency and California regulators charged automakers Volkswagen and Audi on Friday with purposefully violating emission standards in their line of diesel cars.

EPA accused the automakers of using a device in their vehicles to get around the pollution rules. According to EPA, the device regulates emissions, but only turns on and works while emissions are being tested.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, EPA assistant administrator for the agency's enforcement office.

"Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

Giles said VW was "concealing facts" about the devices. The vehicle models involved include the popular Jetta, Audi A-3, Passat and the iconic Beetle, and in model years 2009-2015. The violations cover 482,000 diesel passenger cars.

The EPA's announcement isn't a final decision, but is a clear sign that the EPA believes it has a case against the automakers, one that could lead to fines as large as $37,000 per vehicle. All together, the combined fines could pile up to $18 billion.

An EPA statement said "California is separately issuing an In-Use Compliance letter to Volkswagen, and EPA and the California Air Resources Board ... have both initiated investigations based on Volkswagen's alleged actions."

"Working with US EPA we are taking this important step to protect public health thanks to the dogged investigations by our laboratory scientists and staff," the California board's CEO Richard Corey said. "Our goal now is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action."

EPA accuses VW of cheating on emission rules
Published 12:29 PM EDT Sep 18, 2015

NEW YORK (CNNMoney) —Diesel cars from Volkswagen and Audi cheated on clean air rules by including software that made the cars look cleaner than they actually were, according to federal and California regulators.

The regulators say that the software on the cars turned up the emission controls only when it could tell that the car was being tested.

"The effectiveness of these vehicles' pollution emissions control devices is greatly reduced during all normal driving situations," said the Environmental Protection Agency's notice to the company. "This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides at up to 40 times the standard."

There are nearly 500,000 of the diesel cars on U.S. roads. The models include the VW Jetta, the Beetle and the Golf from model years 2009 through 2015, the Passat from 2014-2015 as well as the Audi A3, model years 2009-2015. The luxury brand is owned by Volkswagen.

Owners of the affected cars do not face health risks according to the EPA and can to

continue to drive or sell the cars. But the EPA says that VW will be responsible for fixing the problem.

Volkwagen did not immediately respond to a request for comment.

City AM:
http://www.cityam.com/224676/volkswagen-told-recall-500000-vehicles-over-emissions

Volkswagen told to recall 500,000 vehicles over emissions
by Catherine Neilan

Volkswagen has been ordered to recall nearly half a million cars in the US by the Obama administration, which claims the German car group used software that was purposely designed to dodge environmental standards for reducing smog.

The US government's Environmental Protection Agency issued the company a notice of violation this afternoon, accusing Volkswagen of having installing a "defeat device" into its four-cylinder Volkswagen and Audi vehicles between 2009 and 2015, according to the New York Times.

The device is programmed to detect when the car is undergoing emissions test, during which time it will turn on its full emissions control systems. These controls are reportedly then turned off when the car is driving in "normal" situations, when the cars pollute more heavily than reported by Volkswagen, the EPA claims.

The government agency estimates that 482,000 diesel passenger vehicles are affected.

Volkswagen could not be contacted at the time of publication.

EPA: Volkswagen used ‘sophisticated software’ to cheat emissions tests
By Ben Wolfgang - The Washington Times - Friday, September 18, 2015

The Obama administration on Friday accused Volkswagen of using a “sophisticated software algorithm” to cheat on emissions testing and mask the fact that some models emit

too much harmful pollution.

Some Volkswagen cars from model years 2009 to 2015, the Environmental Protection Agency said, include software that can detect when they're undergoing emissions testing. Full emissions controls were activated only during testing and then automatically shut down during normal operation, the agency charged.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, assistant administrator for the EPA's Office of Enforcement and Compliance Assurance. "Working closely with the California Air Resources Board, EPA is committed to making sure that all automakers play by the same rules. EPA will continue to investigate these very serious matters."

During normal operation, the "defeat device" allowed Volkswagen cars to emit nitrogen oxides at up to 40 times the federal threshold as laid out in the Clean Air Act.

The EPA has issued "a notice of violation" to the automaker, and the state of California has launched its own investigation into the matter. Volkswagen could face civil penalties for the violations, the agency said.

The allegations apply to about 482,000 diesel passenger cars sold since 2008, including Jettas, Beetles, Audi A3s, Golfs and other models.

EPA accuses Volkswagen, Audi of evading emission laws
Nathan Bomey, USA TODAY 12:12 p.m. EDT September 18, 2015

The German automaker adopted a "defeat device" to trick regulators, the EPA said.

The Environmental Protection Agency on Friday accused Volkswagen of installing software on certain cars in the U.S. to evade federal emission regulations, potentially exposing people to harmful pollutants.

The German automaker adopted what the EPA called a "defeat device" to trick U.S. regulators into believing that its cars met Clean Air Act standards, the federal agency said in a statement.

The agency said 482,000 cars violated federal standards, including four-cylinder Volkswagen cars from 2009-15 and Audi diesel cars from the same period. They included the Volkswagen Jetta, Beetle, Golf and Passat, and the Audi A3.

Volkswagen, whose brands include the luxury Audi lineup, may face fines or other penalties, the EPA said.

The cars are still safe to drive, the EPA said, and owners do not need to take immediate action. But the agency will require Volkswagen to fix the cars for free.

Newsweek:
http://www.newsweek.com/epa-volkswagen-software-cheat-clean-air-rules-373869

EPA: Volkswagen Used Software in Cars to Cheat on Clean Air Rules
BY ZOË SCHLANGER 9/18/15 AT 12:14 PM

A U.S. Environmental Protection Agency investigation has concluded that for years Volkswagen has been installing software in its vehicles that circumvents federal emissions standards for air pollution, the agency announced Friday.

EPA alleges that Volkswagen installed a "sophisticated software algorithm on certain Volkswagen vehicles" that could detect when the car was being tested for emissions. The software would turn full emissions controls on only during the official test. "This results in cars that meet emissions standards in the laboratory or testing station, but during normal operation, emit nitrogen oxides, or NOx, at up to 40 times the standard," EPA said in a press release. They called the software a "defeat device," deliberately installed to evade the Clean Air Act standards.

This "defeat device" was found in several car models, from 2009 models up to 2015 models, according to EPA:

Jetta (Model Years 2009 – 2015)
Beetle (Model Years 2009 – 2015)
Audi A3 (Model Years 2009 – 2015)
Golf (Model Years 2009 – 2015)
Passat (Model Years 2014-2015)
In total, this includes about 482,000 passenger cars.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," Cynthia Giles, EPA's Assistant Administrator for the Office of Enforcement and Compliance Assurance, said in a statement emailed Friday. The agency worked with California regulators to investigate the automobile manufacturer and issue a notice of violation.

"Our goal now is to ensure that the affected cars are brought into compliance, to dig more deeply into the extent and implications of Volkswagen's efforts to cheat on clean air rules, and to take appropriate further action," California Air Resources Board Executive Officer Richard Corey said in the statement.

Volkswagen has yet to respond publicly to the EPA allegations. Newsweek has reached out to the company for comment, and we will update if they respond.

Volkswagen Is Ordered to Recall Nearly 500,000 Vehicles Over Emissions Software
By CORAL DAVENPORT SEPT. 18, 2015

WASHINGTON — The Obama administration on Friday ordered Volkswagen to recall nearly a half million cars from the road, saying the German automaker used software intentionally designed to circumvent environmental standards for reducing smog.

The Environmental Protection Agency issued the company a notice of violation and accused the company of breaking the law by installing software known as a "defeat device" in 4-cylinder Volkswagen and Audi vehicles from model years 2009-15. The device is programmed to detect when the car is undergoing official emissions testing, and to only turn on full emissions control systems during that testing. Those controls are turned off during normal driving situations, when the vehicles pollute far more heavily than reported by the manufacturer, the E.P.A. said.

"Using a defeat device in cars to evade clean air standards is illegal and a threat to public health," said Cynthia Giles, the E.P.A.'s assistant administrator for the Office of Enforcement and Compliance. "Working closely with the California Air Resources Board, E.P.A. is committed to making sure that all automakers play by the same rules. E.P.A. will continue to investigate these very serious violations."

The software was designed to conceal the cars' emissions of the pollutant nitrogen oxide, which contributes to the creation of ozone and smog. The pollutants are linked to a range of health problems, including asthma attacks and other respiratory diseases.

The state of California has issued a separate notice of violation to the company. California,

the E.P.A. and the Justice Department are working together on an investigation of the allegations.

The allegations cover roughly 482,000 diesel passenger cars sold in the United States since 2009.

Affected diesel models include the Volkswagen Jetta (model years 2009-15), Volkswagen Beetle (model years 2009–15), Audi A3 (model years 2009–15), Volkswagen Golf (model years 2009–15) and Volkswagen Passat (model years 2014-15).

The notice of violation is part of a broader, more aggressive enforcement effort by federal environmental regulators on the auto industry. Analysts said it was meant to send a clear message to automakers that they will be harshly treated for compromising federal rules.

It follows a November 2014 announcement of the administration's largest-ever penalty for a violation of the Clean Air Act, in which the government fined the Korean automakers Hyundai Motor and Kia Motors a combined $300 million as part of a settlement for overstating vehicle fuel-economy standards on 1.2 million cars.

"They want to make it clear that they're going to crack down on cheaters," said Frank O'Donnell, president of the environmental advocacy group Clean Air Watch. "They're cheating not only car buyers but the breathing public. They want to lay down the law, enforce the law, and show they're not going to tolerate cheaters. The laws and regulation are only as good as the enforcement."

Subject: Potential remedy for VW Emission

Dear Mr. Grundler,

I read an article in the Los Angeles Times that quoted you concerning the Volkswagen Emission Issue.

We believe we have the alternative remedy for the emission issue EPA is working with Volkswagen to solve. If given the opportunity we could discuss how our ECO Fuel Catalyst will resolve this issue at an inexpensive cost.

We have lab testing documentation, as well as, thousands of road tested diesel vehicles operating under normal driving condition with our ECO units installed.

We are sure you are receiving many inquiries, but we know our product can solve the VW issue. Please take a few minutes to look at our website and replay back (http://www.gatewayenergy.net/). We can meet right away with you and your associates.

Best regards,

Robert Casper

FEDERAL AGENCIES:

Shutdown plans would send thousands home with no pay

Kevin Bogardus, E&E reporter

Published: Monday, September 28, 2015

Federal agencies' contingency plans in the event of a government shutdown would send thousands of federal employees home with no pay.

On Friday, every federal government entity, big or small, released its latest shutdown plans.

The documents outline which vital government functions would be kept up and running as well as which services would fall by the wayside during a lapse of appropriations. In addition, many of the plans flesh out who would be furloughed and who would have to work during a government shutdown.

Agencies have been scrambling to update the plans as Congress has struggled to overcome the latest budget impasse, with government money set to run out Wednesday night.

Lawmakers have not yet approved funding due to debate over whether to provide federal funds to reproductive health provider Planned Parenthood. Nevertheless, it appears the shutdown crisis has been averted, at least for a few months, as Capitol Hill looks set to pass a stopgap spending measure this week after Speaker John Boehner's (R-Ohio) shock decision to resign from office (*E&E Daily*, Sept. 28).

U.S. EPA, for example, now has its shutdown plan in place in case Congress fails to pass new funding by Oct. 1. According to the plan, only 4.97 percent, or 740 of its 14,887 employees, would be required to show up for work.

In addition, the agency would keep only a few functions up and running during a shutdown.

Personnel would make sure to keep EPA's laboratories functioning so lab animals and plants wouldn't be destroyed. The agency's emergency response readiness teams, which help stop and clean up toxic spills, would be at the ready. In addition, EPA attorneys would be made available for legal support if called upon.

But payments for rent and phone service would have to wait until the shutdown ends, the agency would not enter into new contracts, staff travel would be suspended, EPA wouldn't hire any new personnel, and its information technology systems would be scaled back.

The Department of Energy would have similar restrictions on its spending, according to its contingency plan.

DOE wouldn't hold meetings, conferences or seminars. Training at the department would stop. Employees wouldn't be allowed to use their government-issued equipment, such as BlackBerrys. Also, management couldn't authorize any overtime for employees, whether they are furloughed or not.

The Department of the Interior has posted myriad shutdown plans for its various bureaus and offices.

Many of Interior's employees would have to go home if a shutdown happens.

In Interior's Office of the Secretary, 2,267 of its 2,739 employees -- or 83 percent of its staff -- would go on a furlough, according to its contingency plan. The employees still working would be needed for law enforcement, security and other support functions for the department.

Interior's Office of Inspector General would place all 263 of its employees on furlough under the office's plan, and its offices across the country would be closed. Nevertheless, 80 of the IG's employees would be "on call" if an emergency arises.

A lapse in funding would also shutter 408 units of the national park system -- locking Americans out of more than 84 million acres of public land spread across all 50 states.

The National Park Service plan calls for closing the agency and the parks it manages down in two phases over the course of four days.

The first phase would focus on notifying the public of the closure, securing government records and property, and winding down operations. It would begin at 12:01 a.m. Oct. 1 and would conclude by noon.

Over the next 3 ½ days, the agency would shut down all concession facilities and visitor services. Overnight visitors would have two days to make alternative arrangements and leave the parks.

Only 3,322 of the Park Service's 24,681 employees would avoid being furloughed.

The shutdown would also close off access to the Fish and Wildlife Service's more than 560 national wildlife refuges and bring the endangered species listing and recovery programs to a halt. The agency plans to complete most of its shutdown activities within half a day.

A government shutdown would lead to some serious disruption for government employees.

Forty percent of the entire federal workforce, or 850,000 employees, were furloughed during the October 2013 shutdown -- resulting in $2 billion in back pay, or $2.5 billion if including their benefits. Financial research firm Moody's Analytics estimated the total cost of the last shutdown at around $20 billion.

Other agencies ready for shutdown

Others have planned to send many of their employees home, as well.

Furloughs would send home about 36 percent of the Department of Transportation's almost 55,000 employees, but the impact would vary dramatically across DOT's different branches.

While air traffic controllers at the Federal Aviation Administration would keep working, almost 17,000 other FAA staffers would be idled. Virtually all of the Federal Transit Administration's 540-strong

workforce would be furloughed, along with more than two-thirds of the 455 employees at the Pipeline and Hazardous Materials Safety Administration and close to half of the Federal Railroad Administration's staff of 864.

But all of the approximately 3,900 employees at the Federal Highway Administration and the Federal Motor Carrier Safety Administration would keep working, DOT's plan indicates. Their jobs are paid for out of the Highway Trust Fund, which would continue operations during a shutdown, the plan says.

When it comes to the country's mine oversight agencies, the Office of Surface Mining Reclamation and Enforcement and the Mine Safety and Health Administration would keep a skeleton staff to address safety and government property issues.

MSHA would keep 821 of more than 2,000 workers currently on board, according to Department of Labor plans. DOL as a whole would keep roughly 2,700 of more than 15,000 workers.

MSHA said it would "continue key functions which directly involve protecting against imminent threats to human life in the Nation's mines, and which are necessary for the protection of government property." Such functions include targeted inspections of mines, accident investigations, mine plan change approvals, emergency readiness and managerial supervision of federal workers operating through a shutdown.

OSMRE, which in many cases oversees state strip mine regulatory programs, would allow certain workers to stay on board to wind down operations. It would keep seven of more than 400 workers through the shutdown, with 22 on call.

More than 5,300 employees would work during a shutdown at the National Oceanic and Atmospheric Administration. That's about 40 percent of its workforce and a reflection of the "essential" functions it carries out, such as weather forecasting.

According to NOAA's shutdown plan, more than 3,600 employees who stay on would be from the National Weather Service. They would include meteorologists, hydrologists, IT specialists and other employees who work around the clock to provide weather forecasts and perform other critical functions.

Another 469 employees would continue working in NOAA's National Marine Fisheries Service to ensure that fishermen don't overfish and to continue seafood inspections. Independent observers would still board fishing boats, and law enforcement officers would continue to address "critical issues."

Other employees throughout NOAA would also be exempted in a shutdown for various responsibilities, such as ensuring that certain facilities are secure, maintaining labs and providing real-time data for ship navigation.

But many other activities at NOAA would come to a standstill. Most research vessels would return to port within a few days. Research activities -- except those deemed essential -- would stop. Long-term law enforcement investigations would be put on hold. Meetings would be canceled and grant support unavailable.

The Federal Energy Regulatory Commission explained in its plan that 48 of its 1,492 full-time employees and 18 contractors would stay during a shutdown to conduct activities critical to protecting life and property, including monitoring electric reliability, the markets, enforcement matters and infrastructure. Contracts are critical to securing FERC's buildings and operations, according to the document.

Notably, FERC's five, presidentially appointed commissioners are exempted from furlough.

The Nuclear Regulatory Commission, which also laid out safety-related activities that would continue during a government shutdown, has about $13 million in carryover funds -- enough to continue operating for up to four days, said NRC spokesman Eliot Brenner. If the government shuts down, the agency would continue to respond to emergencies, resident inspectors who are the agency's "eyes and ears" would continue working, and any concerns they detect would be communicated to the NRC's four regional offices or headquarters.

One of the government's smallest agencies, the Chemical Safety Board, would cease most operations if the federal government stopped operating, according to its shutdown plan.

The agency would keep its general counsel and an information technology specialist on hand and furlough 36 other employees. The agency, however, would be unable to deploy investigators to chemical incident sites until the government reopened. The CSB's Senate-confirmed officials could continue working but "should avoid speeches, public appearances, or other activities that might convey the impression that the agency is operating normally," the plan said.

Reporters Corbin Hiar, Hannah Northey, Sam Pearson, Manuel Quiñones, Sean Reilly and Emily Yehle contributed.

CAMPAIGN 2016:

Trump eyes 'corporate loopholes,' repatriation to pay for tax plan

Geof Koss, E&E reporter

Published: Monday, September 28, 2015

GOP presidential front-runner Donald Trump today outlined a tax reform plan that would lower overall corporate rates by going after foreign profits and eliminating unspecified "special interest loopholes."

During this morning's event at Trump Tower in Manhattan, the candidate offered one of the most specific policy proposals of his campaign.

"It will be simple, it will be easy, it will be fair," Trump said of his plan to streamline the tax code.

The Trump proposal includes elements that have bipartisan support on Capitol Hill, with a major focus on ending corporate inversions and encouraging the repatriation of foreign profits.

"No business of any size, from a Fortune 500 to a mom-and-pop shop to a freelancer living job to job, will pay more than 15 percent of their business income in taxes," states a summary of the plan. "This lower rate makes corporate inversions unnecessary by making America's tax rate one of the best in the world."

Trump emphasized that the plan would be fully offset. "All of this does not add to our debt or deficit," he said.

Lower corporate tax rates would be paid for in part by a one-time deemed repatriation of corporate profits held overseas at a "significantly discounted 10 percent" rate, as well as an end to deferral of taxes on corporate income earned abroad, states the summary.

There's bipartisan interest on both sides of the Capitol in using repatriated foreign profits to pay for highway construction, an issue that is likely to resurface in the weeks ahead as Congress faces yet another expiration of federal transportation programs (*E&E Daily*, July 14).

Trump acknowledged the appetite for repatriation during the event. "Everyone agrees it should come back," he said.

To lower corporate rates, Trump's proposal also calls for "reducing or eliminating corporate loopholes that cater to special interests, as well as deductions made unnecessary or redundant by the new lower tax rate on corporations and business income," he said. "We will also phase in a reasonable cap on the deductibility of business interest expenses."

While the four-page summary doesn't specify which loopholes would get the ax, Democrats for years have called for the cancellation of tax breaks for the fossil fuel industry -- a position that was reiterated in Senate Democrats' comprehensive energy package last week (*E&ENews PM*, Sept. 22).

While the oil and gas industry opposes the Democrats' plan, it has said in the past it would be willing to give up some of its tax breaks in exchange for lower corporate rates as part of a broader tax overhaul.

Trump's plan also would exempt taxpayers with income of less than $25,000 -- or less than $50,000 for joint filers -- from owing any income tax at all. The campaign said it would free 75 million households from tax liability.

Under the plan, those who qualify for the exemption would send the IRS a one-page form that says "I win."

Trump said his plan would consolidate the current seven individual tax brackets into four, while eliminating the alternative minimum tax, the marriage penalty and the "death tax."

While Trump has been criticized for making lofty campaign promises with little detail on how he would accomplish his policy goals, the billionaire appeared comfortable wading into tax policy.

"The economy is what I do well," he said.

CLIMATE:

Obama vows cooperation at U.N. to 'decisively' attack warming

Jean Chemnick, E&E reporter

Published: Monday, September 28, 2015

Climate change featured briefly in President Obama's address this morning to the United Nations General Assembly's final leadership summit ahead of this year's high-stakes round of climate negotiations in December.

The president reserved one paragraph late in his speech for a call to action on warming, telling heads of state from around the world that the United States would cooperate with any nation "that is willing to do its part so that we can come together in Paris to decisively confront this challenge."

He told the gathering of leaders from 193 countries that addressing warming would also help eradicate global poverty and create new industries.

"We can roll back the pollution that we put in our skies, and help economies lift people out of poverty

without condemning our children to the ravages of an ever-warming climate," the president said. "The same ingenuity that produced the industrial age and the computer age allows us to harness the potential of clean energy."

Obama has made it a personal priority to help broker a deal on emissions and finance this December, raising climate issues in meetings with leaders from a variety of key countries. That produced a major agreement last week with China in which the world's highest-emitting nation agreed to introduce a cap-and-trade system to contain emissions beginning in 2017. And Obama meets today with Indian Prime Minister Narendra Modi on the sidelines of the General Assembly meeting to discuss India's emissions commitments ahead of Paris.

But Obama devoted relatively little time in today's address to warming, spending the bulk of his hourlong speech on issues including Islamic extremism and the normalization of relations with Cuba.

Pope Francis in his own address to the U.N. gathering Friday argued that environmental destruction would lead to human suffering (*Greenwire*, Sept. 25).

"Any harm done to the environment, therefore, is harm done to humanity," the pontiff said, sounding a theme he also raised in speeches at the White House and on Capitol Hill.

SECURITY:

China, U.S. lay cyber 'rules of the road'

Blake Sobczak, E&E reporter

Published: Monday, September 28, 2015

President Obama and Chinese President Xi Jinping have agreed to a limited set of rules in cyberspace, including an end to government spying for economic gain.

In a news conference Friday afternoon, Obama said the two countries "have reached a common understanding on the way forward" by agreeing not to "knowingly" support online theft of intellectual property from private companies.

"In addition, we'll work together, and with other nations, to promote international rules of the road for appropriate conduct in cyberspace," Obama said, adding, "so this is progress."

The U.S. government long has voiced concerns over cases of state-sponsored cyberespionage aimed at siphoning technology to Chinese state-owned companies. Beijing has denied stealing secrets from U.S. energy firms, computer chip manufacturers and other major companies for commercial gain. Last week's agreement follows repeated pledges by Xi to uphold international law in cyberspace during his first visit to the United States as China's head of state.

Security experts have already expressed doubts about whether China will stick to its side of the deal, but some business leaders and politicians say it's still a step in the right direction.

"The commitment to not engage in cyber theft of intellectual property and jointly fight cybercrime is a positive development that now needs to be followed with tangible progress," said John Frisbie, president of the U.S.-China Business Council, in a statement after the agreement was announced.

Sen. Tom Carper (D-Del.), ranking member of the Homeland Security and Government Affairs

Committee, pointed out in a statement Friday that "some of my colleagues will say that this agreement doesn't do enough."

"But we must start somewhere and this is more than a good start," he said.

Carper added that the United States "can't just believe what China says" and would need to keep a close eye on Beijing's behavior in cyberspace.

Senior administration officials already have indicated they will keep monitoring Chinese hackers and are prepared to bring new economic sanctions against any miscreants.

Jason Healey, director of the Cyber Statecraft Initiative at the Atlantic Council, said on Twitter that such "naming & shaming has new importance" now that Xi has "personally committed" to stop cyberespionage for commercial gain.

In 2014, the U.S. Justice Department unsealed indictments against five Chinese military officers accused of stealing information from U.S. companies, in a move seen as aimed at shaming Beijing.

Healey's thinking is that Xi's latest promises to behave in cyberspace could come back to bite him if the United States brings new criminal charges or financial penalties against Chinese hackers suspected of stealing trade secrets.

"Both governments will not be engaged in or knowingly support online theft of intellectual properties," Xi said through an interpreter Friday, later adding that "during my current visit, I think it's fair to say that the two sides, concerning combating cyber-crimes, have reached a lot of consensus."

"Going forward, we need to, at an early date, reach further agreement on them and further put them on the ground," Xi said of the cyber rules.

AIR POLLUTION:

Ex-Volkswagen CEO facing criminal probe

Sean Reilly, E&E reporter

Published: Monday, September 28, 2015

German prosecutors have opened a preliminary investigation into any role that Martin Winterkorn, former chief executive officer of Volkswagen AG, may have had in an emissions cheating scheme affecting millions of diesel-powered vehicles.

The inquiry will focus on who bears responsibility for rigging the cars to evade testing requirements, according to a news release today from the prosecutor's office in the central German city of Braunschweig, not far from Volkswagen AG's corporate headquarters in Wolfsburg.

While VW's board had said last week that it was voluntarily requesting an investigation, Julia Meyer, a spokeswoman for the prosecutor's office, told the Associated Press that about a dozen complaints had been received in all. She would not predict how long the probe might last.

Winterkorn resigned Wednesday, five days after U.S. EPA and California state regulators accused the automaker of installing software on almost a half-million VW and Audi cars that applied full emissions controls when the vehicles were being tested but otherwise left them free to spew nitrogen oxides at up to

40 times the allowable levels.

In his resignation statement, Winterkorn, who had headed the Volkswagen Group since 2007, said he knew of no wrongdoing on his part but accepted responsibility for the "irregularities" (*Greenwire*, Sept. 23).

The company, which on Friday named Matthias Mueller, chairman of its Porsche unit, as Winterkorn's replacement, had no immediate comment today on the news of the investigation.

Worldwide, the scam affects some 11 million vehicles, the company has said. In the United States alone, VW could face up to $18 billion in fines. In a sign that the fallout is spreading throughout the industry, EPA managers Friday warned all automakers that their cars could be tested under real-world driving conditions for the "defeat devices" (*Greenwire*, Sept. 25).

But the episode is also giving fresh wind to EPA critics who see the existing testing framework as overly deferential to car and truck manufactures. Volkswagen's deception, which has been going on for years, was uncovered by West Virginia University researchers working for the International Council on Clean Transportation, an independent nonprofit.

In a news release today, Public Employees for Environmental Responsibility (PEER), a watchdog organization, accused EPA of failing to use actual "on the road" emissions data collected from diesel vehicles to monitor either emissions or fuel efficiency.

Currently, testing is conducted "by putting the vehicle on a dynamometer -- essentially a big treadmill," PEER said in the release. When heavy-duty diesel engine manufacturers in the late 1990s were found to have resorted to the same type of manipulation used by Volkswagen, they instead agreed to "in-use" testing to show compliance, the group said.

But EPA has refused to make the data from that testing program public on the grounds that it is "confidential business information," the group said, and has also invested $50 million in a new chassis dynamometer for light-duty vehicles to be rolled out next month.

The Volkswagen scandal shows that dynamometer technology "is a dinosaur, yet EPA [keeps] pouring money into it," Jeff Ruch, PEER's executive director, said in the release. "The fact that the VW cheating was revealed by outsiders indicates the clubby and closed manner in which this arm of EPA operates."

In an emailed response, EPA spokesman Nick Conger called many of PEER's points "simply wrong." The agency uses a wide range of tools besides dynamometers "that are all critical to the ... overall compliance program," Conger said. They include on-road testing, audits of industry emissions testing labs and "selective enforcement" reviews where vehicles and engines are pulled at random from an assembly line and tested. EPA also "continually updates its oversight strategies, and adapts when we learn of ways that manufacturers can game the system," Conger said. "That is part of any oversight effort."

ENERGY POLICY:

Tribes seek federal jump-start for reservation projects

Dylan Brown, E&E reporter

Published: Monday, September 28, 2015

Tribal leaders have drawn a map that they hope will help close the gap between lagging reservation

energy development and booming renewable and traditional power sectors.

The recommendations for more grants, loans and technical assistance flowed from the National Tribal Energy Summit in Washington, D.C., last week, where the Obama administration made clear the need to boost Indian Country projects (*E&ENews PM*, Sept. 24).

Among the recommendations from working groups: a big jump in loan guarantees available to tribes.

Jana Ganion, energy director for the Blue Lake Rancheria in California, said a "high priority" should be placed on $100 million in appropriations for the Department of Energy's Office of Indian Energy Policy and Programs. That would be enough funding for at least 25 staffers for field offices nationwide.

"The Office of Indian Energy supports efforts at every single tribe and Alaska Native community ... and we need it to continue," Ganion said.

In its fiscal 2017 budget proposal, the Obama administration asked for $20 million for the young program, a 25 percent jump from this year, but the increase awaits congressional approval. Meanwhile, appropriators have failed to include $11 million for additional DOE tribal loan guarantees in any budget markup.

Frequently operating on a small scale, tribes are often cut off from funding, an issue raised repeatedly at the summit.

Tribes took advantage of less than a tenth of 1 percent of tax-exempt bonds issued between 1987 to 2010, according to the Treasury Department.

More grants in lieu of tax credits, Ganion said, could give tribal governments more access to direct renewable energy incentives, but many tribal corporations and consortia, particularly in Alaska Native communities, don't qualify.

Ganion said federal agencies need to ensure "eligibility criteria fits tribal structures as they need them to fit."

While fossil fuels were part of the discussion -- many tribes looking to reduce poverty and high unemployment rely on fossil energy -- tribal leaders at the summit declared their focus on aligning with the administration's goal of developing a "clean energy economy."

But leaders said they need help navigating financing options, asking for more programs like U.S. EPA's Indian Environmental General Assistance Program, which helps tribes comply with environmental regulations and clean up pollution.

Deputy Energy Secretary Elizabeth Sherwood-Randall said the administration is heeding that message.

"Institutionalization will lead to results -- that is what you've done with us at this summit this week," she said. "Because we want this work to endure far beyond this administration."

'We will be your partner'

Energy efficiency is also part of the equation on reservations, but John McCoy, a Washington state senator and Tulalip tribal member, said the Department of Housing and Urban Development's policy is "stuck in the '40s" in the face of small-scale solar and wind energy proposals.

"We need to get them to rethink what they allow and don't allow because we need to put these technologies on our low-income housing for our citizens," said McCoy, who heads the National Caucus of Native American State Legislators' energy committee.

Indian leaders acknowledged the need for tribes to do more themselves to develop energy resources, including convincing constituents that major projects are worth the time and money.

"The [return on investment] is taking care of your people," he said.

Education is integral to "capacity building," McCoy said, which requires emphasis on science and technical education.

"You have to have a champion on staff that knows these complex issues," he said.

Gary Davis, CEO of the National Center for American Indian Enterprise Development, a co-host of the summit with the Department of Energy, said Indian Country will have to spur its own success.

"Nobody can do anything without capital ... but no businessperson will tell you that capital will solve all your problems if you don't have a plan, if you don't know how to run a business," Davis said.

Sherwood-Randall said the administration is committed to self-determination for Indian Country, asking tribal leaders to continue using energy development to build economies that will fundamentally improve quality of life.

"We will be your partner in walking that walk," she said.

SOLAR:

Industry, customers wary of move to hike Calif. net-metering fees

Published: Monday, September 28, 2015

A proposal to charge solar customers more for their connection to the electric grid has companies and users concerned that many of the benefits of the technology will be reduced.

Under the proposal, existing rooftop solar customers would be exempted from some of the net-metering charges for 20 years from the date their solar systems were installed, but other regulatory changes could raise their costs by charging customers higher rates for small purchases of electricity.

SolarCity CEO Lyndon Rive said the results will be "catastrophic" if the California Public Utilities Commission approves the proposals at hearings in October.

Utilities say they need to credit solar users who sell electricity back to the grid at a rate about half of what they would pay for the electricity. They also want to charge monthly fees based on the size of the solar system.

"All customers who use the grid should help pay to operate and upgrade the grid," said Caroline Choi, Southern California Edison's vice president of energy and environmental policy.

Critics say the move is a ploy to make solar power unaffordable and keep customers from abandoning traditional utilities.

Inglewood, Calif., resident Miguel Espinoza, who recently signed an agreement with SolarCity to cut his electric bill to $130 per month, said changing how the state treats his solar installation would defeat the purpose of buying it.

"This thing would be worthless to me," Espinoza said (Ivan Penn, *Los Angeles Times*, Sept. 26). **-- SP**

NATURAL GAS:

Energy Transfer, Williams Cos. to merge in $32.6B deal

Published: Monday, September 28, 2015

Energy Transfer Equity LP will buy Williams Cos. for about $32.6 billion in a deal that will combine rival natural gas pipeline operators.

Dallas-based Energy Transfer had sought to buy Williams for six months and saw an unsolicited offer to buy the company rejected in June.

Williams Chairman Frank MacInnis said today that the company's board decided the deal with Energy Transfer was the best option for shareholders.

Analysts said federal regulators were unlikely to block the merger, which would make one of the five largest energy companies in the world, because the companies' existing businesses largely do not overlap.

Both companies have seen their stock prices decline more than 25 percent in the past three months, one reason companies have eyed rivals for potential acquisitions (Tess Stynes, *Wall Street Journal*, Sept. 28). **-- SP**

CALIFORNIA:

State bills aim for environmental justice

Published: Monday, September 28, 2015

A bill awaiting California Gov. Jerry Brown's (D) signature would launch the most ambitious program in the country to help grow the use of alternative energy in low-income, minority communities.

The Multi-Family Affordable Housing Solar Roofs Program would provide up to $100 million per year in funding for 10 years to install solar panels at 210,000 affordable housing units, which advocates see as a key environmental justice initiative.

If approved, the program could save tenants more than $38 million per year in utility bills and $19 million each year in solar tax credits and other savings.

"It's a huge deal," said Parin Shah, a senior strategist for the Asian Pacific Environmental Network. "There isn't anybody else putting resources where their rhetoric is."

A.B. 693, by Assemblymember Susan Eggman (D), would fund the solar panels using money from the state's carbon cap-and-trade program (*ClimateWire*, Sept. 14).

The Legislature also approved three other bills this year -- A.B. 1071, to create a policy to return part of pollution fines to local communities; A.B. 1288, to add two representatives who work with low-income communities to the Air Resources Board; and S.B. 673, to implement a more rigorous permitting process for hazardous waste facilities in poor neighborhoods (Haya El Nasser, Al Jazeera America, Sept. 25). **-- SP**

POWER PLAN HUB:

States cue up initial talks on EPA rule options

Emily Holden and Rod Kuckro, E&E reporters

Published: Monday, September 28, 2015

States around the country are buckling down to explore Clean Power Plan compliance options, even while some of them plan lawsuits against U.S. EPA.

This week will feature public meetings in California, Georgia and Virginia. In the last several weeks, agencies and stakeholders also met in Colorado, Minnesota, Missouri, Montana and Pennsylvania. (Visit our Power Plan Hub state pages for those stories and stay tuned for more from those states in *ClimateWire* this week.)

Most states are starting to gather input from residents and special interests while exploring decisions they will have to make in writing plans (or requesting two-year extensions) by September 2016.

States must decide whether to pursue rate-based or mass-based standards -- to either reduce the level of power plant emissions or cap the total carbon output of the electricity sector. They are weighing various policies to cut emissions and considering whether to include compliance-credit trading options to work with other states to achieve carbon goals.

To gain an extension, states must at least describe options they are considering, justify their need for more time and describe their public outreach efforts.

Advertisement

Many states must also consider what roles state agencies and legislatures will play.

Scoping out state events

In Georgia today, the Georgia Institute of Technology's School of Public Policy and Emory University's Climate@Emory will host a town hall on options for complying with the Clean Power Plan.

Speakers include Karen Hays, chief of Georgia's Environmental Protection Division Air Protection Branch, and Chuck Eaton, chairman of Georgia's Public Service Commission, as well as representatives from Georgia's Department of Economic Development, U.S. EPA, Emory and Georgia Tech.

E&E reporter Kristi E. Swartz will attend.

In Colorado on Wednesday, the Colorado State University Energy Institute, the Center for the New Energy Economy and the School of Global Environmental Sustainability will co-host an informational overview of EPA's Clean Power Plan, featuring former Colorado Gov. Bill Ritter (D) and CNEE senior policy advisers. CNEE has been organizing Western states considering compliance paths for the rule.

In California on Friday, the Air Resources Board will hold an all-day public workshop on the state's cap-and-trade program and plan for complying with the Clean Power Plan. The portion from 3 to 5 p.m. PDT will focus on the U.S. EPA rule. E&E's Debra Kahn will report on the event.

Virginia has also been holding informal listening sessions around the state.

Around Capitol Hill

At 1 p.m. tomorrow, the Environmental and Energy Study Institute will host a briefing about the best compliance strategies for the Clean Power Plan. EESI's lineup includes EPA Office of Air and Radiation senior counsel Joe Goffman and the executive directors of the organizations that represent state air administrators, electric regulators and energy officials.

Bill Becker will speak for the National Association of Clean Air Agencies, Charles Gray will represent the National Association of Regulatory Utility Commissioners, and David Terry will appear for the National Association of State Energy Officials.

Republicans in Congress will renew their attacks on the Obama's administration's air rules with a Senate Energy and Public Works Committee hearing, also at 10 a.m. tomorrow.

The EPW Committee hearing will explore the "economy-wide implications of President Obama's air agenda," and will focus on the ozone rule. EPA air chief Janet McCabe will testify.

Related events

In West Virginia through tomorrow, the Southern States Energy Board meets to consider the transformation of the electricity industry and impacts to coal suppliers. A panel today will explore nuclear power's role in the Clean Power Plan. McCabe will speak about the federal role in fostering innovation and clean energy technologies.

In Austin on Wednesday and Thursday, E&E reporter Edward Klump will be following the Gulf Coast Power Association's fall conference, which includes a keynote address by Federal Energy Regulatory Commission member Colette Honorable and a session on the challenges and opportunities of regulations like the Clean Power Plan to the power business.

The latest CPP news

In case you missed it:

- Top officials in North Carolina say nuclear power may be the best compliance option for the Clean Power Plan (*ClimateWire*, Sept. 28).

- The Colorado Department of Public Health and Environment sketched out questions for the public to consider as the agency works on a compliance plan with electric regulators and the state Energy Office (*ClimateWire*, Sept. 28).

- While opponents of the Clean Power Plan await its publication in the *Federal Register* before they can move forward with attacks, E&E reporter Rod Kuckro looked into why the process takes so long (*EnergyWire*, Sept. 25).

- North Dakota Gov. Jack Dalrymple will meet with EPA officials to protest his state's vastly tougher goals under the final rule. A number of Western governors are visiting Washington, D.C., this week to attend congressional hearings. E&ETV's Monica Trauzzi will sit down with several of them (*EnergyWire*, Sept. 25).

- Montana is grudgingly preparing options for Clean Power Plan compliance, while weighing whether to sue (*ClimateWire*, Sept. 24).

- The Southwest Power Pool says multi-state coordination to cut CO2 is the smartest option (*ClimateWire*, Sept. 24).

- *ClimateWire* explored an emerging political narrative about whether the Clean Power Plan creates "winners" and "losers" among the states (*ClimateWire*, Sept. 21).

- A white paper from a former Wisconsin electricity regulator and onetime adviser to Energy Secretary Steven Chu says complaints that the rule will harm electric reliability are all political (*EnergyWire*, Sept. 21).

1.STATES:

Under Clean Power Plan, Pa. confronts its deep ties to coal

WASHINGTON, Pa. -- Pennsylvania's status as a nationwide energy giant is evident in the rural outskirts of this community in the state's southeast. A nearby church is dwarfed by the silos of Consol Energy Inc.'s Bailey Preparation Plant. Conveyor belts for carrying coal from nearby mines weave between the hills surrounding the operation. And in nearby Ryerson Station State Park, an empty field that was once a favorite swimming spot has driven years of litigation and activism after land movement blamed on underground longwall mining caused the lake to completely drain in 2005. The area is also home to staunch coal defenders. But now that the Obama administration has released the final Clean Power Plan, aimed at reducing greenhouse gas emissions from power plants, Pennsylvania is taking a hard look at its relationship with the black rock.

2.NEGOTIATIONS:

France, U.K. increase their payments to climate aid

Subject: Potential remedy for VW Emission

Dear Mr. Grundler,

I read an article in the Los Angeles Times that quoted you concerning the Volkswagen Emission Issue.

We believe we have the alternative remedy for the emission issue EPA is working with Volkswagen to solve. If given the opportunity we could discuss how our ECO Fuel Catalyst will resolve this issue at an inexpensive cost.

We have lab testing documentation, as well as, thousands of road tested diesel vehicles operating under normal driving condition with our ECO units installed.

We are sure you are receiving many inquiries, but we know our product can solve the VW issue. Please take a few minutes to look at our website and replay back (http://www.gatewayenergy.net/). We can meet right away with you and your associates.

Best regards,

Liberté • Égalité • Fraternité
RÉPUBLIQUE FRANÇAISE

MINISTÈRE DE L'ÉCOLOGIE, DU DÉVELOPPEMENT DURABLE
ET DE L'ÉNERGIE

La ministre

Paris, le 22 septembre 2015

Madame l'Administratrice,

Le 18 septembre 2015, l'agence fédérale américaine de protection de l'environnement (US Environmental protection agency - EPA) a publié un avis d'infraction à la réglementation américaine en matière d'émission (Clean Air Act) par le groupe Volkswagen pour la production et la vente de voitures équipées de moteur 2L diesel émettant jusqu'à 40 fois plus que la limite d'émission autorisée des oxydes d'azote (NOx).

L'EPA considère que le groupe a introduit sur le marché américain, entre 2009 et 2015, des véhicules équipés d'un dispositif d'invalidation au sens de la réglementation en vigueur. VW aurait installé, sur les véhicules incriminés, un logiciel détectant que le véhicule subit un contrôle de conformité aux émissions polluantes et permettant d'activer des dispositifs antipollution de traitement des NOx lors du contrôle, alors que ces dispositifs antipollution sont inactifs en situation de conduite réelle. En Europe, le règlement (CE) n°715/2007, fixant notamment les limites réglementaires des polluants des normes Euro 5 et 6, interdit dans son article 5 l'usage de *dispositifs d'invalidation qui réduisent l'efficacité des systèmes de contrôle des émissions.*

Les éléments mis en avant par l'EPA sont préoccupants. Compte-tenu de leur ampleur, j'ai le devoir, en tant qu'autorité chargée du contrôle des normes antipollution, de m'assurer que de telles pratiques n'ont pas eu cours sur le territoire français. Il convient de s'assurer que les véhicules homologués en France respectent la réglementation en vigueur. Aussi, je souhaite qu'un retour d'expérience puisse être tiré au plus vite des investigations menées aux Etats-Unis, afin que les contrôles réalisés sur les émissions de polluants des véhicules mis en circulation soient parfaitement fiables.

Madame Gina McCarthy
Administratrice de l'US EPA
1200 Pennsylvania Avenue, N.W.
Washington,DC 20460
ETATS-UNIS

VW FOIA, EPA 06/20/2017 2017-FFP_027803

J'ai donc demandé à l'organisme certificateur français, UTAC-CERAM, de se rapprocher de vos services pour bénéficier de leur expertise. Sur la base des renseignements que vous voudrez bien leur communiquer, j'étudierai avec la plus grande attention la possibilité de mettre en place en France un protocole d'investigations qu'il conviendra de conduire pour identifier de telles fraudes.

En vous remerciant par avance, je vous prie d'agréer, Madame l'Administratrice, l'assurance de mes sentiments les meilleurs.

Bien attentif

Ségolène ROYAL

Paris, September 22, 2015

Dear Ms. McCarthy,

On September 18, 2015, the U.S. Environmental Protection Agency (EPA) published a notice of violation of the Clean Air Act by the Volkswagen Group for the production and sale of vehicles equipped with 2-liter diesel engines emitting up to 40 times the permitted emission limits for nitrogen oxides (NOx).

The EPA believes that between 2009 and 2015 the group introduced into the American market vehicles equipped with a defeat device to circumvent current regulations. VW reportedly installed in the implicated vehicles software that detected that the vehicle was being tested for compliance with harmful emissions standards and made it possible to activate NOx emission control devices during the inspection, while these emission control devices are inactive during normal driving situations. In Europe, regulation (EC) No 715/2007, which notably sets the regulatory limits for pollutant emissions in line with Euro 5 and 6 standards, prohibits in article 5 the use of defeat devices that reduce the effectiveness of emission control systems.

The information released by the EPA is troubling. Given the magnitude of the problem, it is my duty as the authority tasked with monitoring antipollution standards to ensure that such practices are not occurring on French soil. We must make sure that vehicles approved in France abide by current regulations. I would therefore like to obtain feedback from the U.S. investigations as quickly as possible to ensure the absolute reliability of emissions inspections for vehicles on the road.

I have therefore asked the French certification body, UTAC-CERAM, to contact your agency, in order to benefit from its expertise. Based on the information you kindly could provide to us, I will closely study the possibility of establishing a protocol, in France, for the appropriate investigations to be conducted to identify such fraudulent practices.

Thanking you in advance, I remain yours sincerely,

Ségolène Royal

Autos & Shared Mobility: VW Emissions: Raises Questions Over Internal Combustion Sustainability

The VW emissions news could raise the cost of doing business for all participants in the internal combustion engine business, accelerating a potential move to EVs that is just taking root.

The VW situation is negative for the broader auto industry (not just VW) on many levels. Just yesterday, we met with the CEOs of two Detroit-area auto firms. Each described how the regulatory response to the situation is likely to lead to significantly higher levels of scrutiny, technical challenge and cost increase. If this happens, either the car companies pay or the consumers pay. Given the highly competitive nature of the auto industry, we strongly suspect the consumer will get the better end of the deal. With respect to emissions, the Morgan Stanley Global Auto team believes the industry may run the risk of moving towards a 'guilty until proven innocent' posture with regulatory authorities.

OK – so the cost of doing business in autos may have gone up. But how much could this really cost the industry? The potential scale could take some investors by surprise. Aside from the questions about company practices and regulatory impact, it has long been known that real-world fuel-economy and emissions of vehicles in the fleet do not achieve the same levels of performance as tested in a controlled environment for regulatory/certification purposes. It seems logical to us that the severity of the response following VW's actions could result in a narrowing of the gap between lab tested emissions and real world emissions, at a materially higher cost to auto manufacturers. **It appears the stock market is also looking beyond the immediate arena of VW and diesel engines. In the past week, publicly traded global auto companies (OEMs and suppliers) have shed approximately $200bn of market capitalization, an amount equal to the market cap of Toyota - the world's most valuable car company.**

Not just diesel. The EPA appears to be enhancing oversight on emissions across all engines - not limited to diesel. According to the Detroit News (citing the EPA's National Vehicle and Fuel Emissions lab in Ann Arbor, Michigan, the California Air Resources Board and Environment Canada), the EPA is 'upping its game' and will initiate new emissions testing protocol for greater numbers of vehicles powered by both diesel and gasoline engines already on the road. These procedures can include spot-checks of privately owned cars, rental cars and even vehicles sourced directly from the assembly line.

At this early stage, it is impossible to estimate with any precision just how great the economic impact of VW's actions could be for the broader industry. We have analyzed data on CO2 emissions targets vs. additional technology/manufacturing costs to achieve historical and projected emission standards to get a sense of the additional costs per gram of CO2. There are substantial amounts of data from automotive suppliers, OEMs and regulatory agencies alike on this topic. Depending on the starting point, technology and regulatory target, the cost per gram of CO2 reduction can range form $6/gram to over $100/gram. In Europe, relative to today's 130 g/CO2 baseline, the average car would require EUR 1,000 added manufacturing costs per unit to achieve 95g/CO2, or roughly $32/g. For sensitivity sake, real-world emissions would only need to be off by 2% or 3% to account for a potential increase of $100/cost per car. Our sensitivity analysis below is net of any offsetting efforts by manufacturers to compensate for rising costs through tertiary cost cutting actions (pressure on the supply chain) or attempts to pass on higher costs to the consumer (which could result in lower volume).**We believe it is worth it for investors to think about the sensitivities of unit economics of cost inflation at least at a high level:**

- The industry produces roughly 80 million units annually.

- Every $100 cost increase per car represents $8bn of pretax profit, or a bit more than $5bn after tax.

- Assume these costs are recurring annual expenses in the form of R&D costs and higher variable cost of production.

- If one were to capitalize the after tax costs at 10x, this sums to more than $50bn of costs to the industry

- Auto OEM industry profit is roughly $80bn today ($1.6 trillion at a 5% margin).

- The impact of each $100 cost inflation (again, all else equal – and assumed not passed onto the consumer) equates to 10% of global OEM industry profit.

Consider further….

- What if cost inflation is higher than $100/unit? What if it's hundreds of dollars per unit?

- The regulatory telemetry/compliance expectation curve steepens significantly through 2020 and 2025.

- All major auto companies are increasingly allocating substantial financial and technological resources towards sustainable propulsion systems. So while they're facing increased regulatory scrutiny to commercialize technology that may have a limited long-term future in the marketplace. On top of this, they have the burden of developing alternative powertrains at the same time.

- EV manufacturers such as Tesla Motors not only don't spend any money on vehicle emissions regulations… they get paid for selling ZEV credits and receive other benefits to encourage the development of EV technology.

These developments are particularly impactful given VW's reputation as one of the strongest players in the industry. VW is one of the world's largest, most profitable, technologically advanced auto manufacturers in existence today, enjoying a reputation for high quality products and delivering high value to consumers.

But what does this event say, at a high level, about the prospects of the long-term viability of engines that are based on a technology that, at its core, has not changed fundamentally in over 100 years?

The VW situation may help to call into question more than a century of ICE powertrain dominance. The timing of the news breaking in the same week that stories are percolating about Apple preparing to ship an Electric Car by 2019 is symbolic. We are not at all suggesting that internal combustion engine technology will disappear in 10 or 15 years. Given any number of capacity, technological, consumer and political factors, the potential substitution would take far longer to run its course. But the timing of the initial change and steepness of the telemetry may take the market by surprise over the next 3 to 5 years. Driving all of this at the heart is the constantly improving economic gap between EV and ICE. Consider the following:

- It is widely suggested in the media (recently in the WSJ on September 21) that Apple may be working on an electric vehicle with first shipments as soon as 2019. Apple has not commented in response to these rumors. See our April 22 note: Tesla Motors Inc.: Can Apple Save the Electric Car?

- Tesla is on the eve of launching its Model X SUV which we expect to be superior to the Model S in just about every measurable category of performance, safety, quality and content.

- Tesla has yet to make a single battery back at its large scale, in-house, highly automated battery manufacturing facilities.

- Autonomous car development is proceeding on multiple fronts and are a natural fit for an EV architecture.

- Manufacturing costs of batteries are falling industry-wide. According to industry sources, the $200 to $300 cost per KwH for batteries (pack level) Tesla Motors claimed to have achieved over 3 years ago to widespread skepticism may now be representative of where the broader state of the industry is today. Tesla's Elon Musk targets pack level battery costs well below $200/KwH by the time the first Gigafactory is ramped up (2018) with a longer-term target of under $100/KwH by the middle of next decade.

- Sharing economy significantly changes the EV model. Uber-like business models that can use a car 5 to

10x as much as a privately owned car can far more rapidly amortize the high up-front technology acquisition cost for the EV powertrain (battery). Shared vehicles also help alleviate other inconveniences with EVs such as range anxiety and charging times are executed at the fleet level in a taxi-like application.

- Emission standards stringency gets materially more difficult over the next 10 year (please ask us to send you the latest regulations in any of the major regions).

- Regulatory scrutiny could reasonably be expected to get harder in a post VW world.

Investment significance. We reiterate our OW on Tesla Motors with a $465 price target. Our top pick in US autos. In our opinion, the events of the past week could play a role in the shift in powertrain from internal combustion engines to shared electric autonomous mobility where we believe Tesla enjoys some unique advantages vs. its traditional automotive peer group. The advantage is more than in electric cars. It's easy to make an EV. In our opinion, it's far harder to make a car with a completely in-house OS designed for machine learning via over-the-air updates to enhance energy storage, performance, mapping and autonomous features as the car is operated in the real world. See our June 16th note: Why We're Serious EV Bulls Again .

Tesla – Valuation & Risks

Valuation Methodology: Our PT of $465 represents the midpoint of our base and bull case valuation ($319 and $611, respectively) and incorporates our view that while a mobility app is likely to be announced within 12-18 months, there is a degree of uncertainty as to if, when and how this product unfolds.

Bull Case - $611

Base case valuation of $280 for core business and $244 for Tesla Mobility. We value Tesla Mobility at $65-$615 using a 15-year DCF assuming 30% tax rate, 11% discount rate, and terminal cash flow perpetual growth rate of 3% (implying an exit NOPAT multiple of 12.5x). To derive our bull case valuation for Tesla, we add to our $280 valuation for Tesla Motors: 1) $244 for Tesla Mobility which assumes 1% of global miles traveled and 9.3% pretax margins by 2029, and 2) $87 for Tesla Energy (top end of $39-$87 valuation) which assumes that 30% of Gigafactory output is sold to the power sector at a 30% margin.

Base Case - $319

We believe Tesla Motors cannot be valued on near-term metrics on multiples like traditional auto companies. We have thus chosen a 15-year time horizon for our DCF which captures the full maturation of the Model S, Model X (and top-hat derivatives), and also the ramp-up of its mass market electric vehicle (the Gen 3). We have applied an 11% WACC with a range of 9% to 13%. The terminal value, calculated on a midpoint of 10x EV/EBITDA, accounts for roughly 50% of the total DCF value across the range of methodologies we have applied to arrive at our valuation of $280 for the core business. Our base case assumes the successful commercialization of Model S, X and Gen 3 with combined volumes surpassing 800k units by 2029 with OP margins normalizing at ~14.5%. Separately, we value Tesla Energy at the bottom of our $39-$87 valuation range. We assume that 20% of Gigafactory output is sold to the power sector at a 20% margin. Our base case valuation for Tesla thus incorporates $280 for the core Tesla Motors business and $39 for Tesla Energy. No value ascribed for Tesla Mobility.

Bear Case - $100

Tesla is limited to niche premium brand status. A thriving, but small company with OP margins normalizing at 10%. Launch of Model X faced with significant execution issues. Model S and X combined volume of over 70k units by 2020. Gen 3 volume reaching 100k units by 2020 and 300k by 2029. Valuation excludes any further benefits from the sale of ZEV credits. No value ascribed to Tesla Energy or Tesla Mobility.

Key Risks:

Tesla may never make the leap to a shared mobility model, limiting itself to a niche premium brand with low volumes.

Investors should allow a reasonable level of execution risk on the many unprecedented innovations brought to market on the Model X including never-been-done-before attributes like the double-ringed doors.

Tesla is guaranteeing the value of its Model S in a lease-finance transaction, exposing the company to residual value risks 39 months out.

Volatility in commodity prices such as oil materially change the economic benefits of electric vehicles, particularly when commercialized at lower price points and higher volumes.

Expansion into non-auto business like grid/solar energy storage exposes Tesla's operations to untested cost, competitive and regulatory forces.

US dealer franchise laws that may prevent TSLA from operating its own stores.

VW FOIA, EPA 06/20/2017 2017-FFP_027828

Disclosure Section

The information and opinions in Morgan Stanley Research were prepared by Morgan Stanley & Co. LLC, and/or Morgan Stanley C.T.V.M. Global Research Conflict Management Policy

Morgan Stanley Research has been published in accordance with our conflict management policy, which is available at www.morganstanley.com/institutional/research/conflictpolicies.

Important US Regulatory Disclosures on Subject Companies

As of August 31, 2015, Morgan Stanley beneficially owned 1% or more of a class of common equity securities of the following companies covered in Morgan Stanley Research: Apple, Inc., Avis Budget Group Inc, BMW, Daimler, Delphi Automotive PLC, Fiat Chrysler Automobiles NV, Goodyear Tire & Rubber Company, Google, Kia Motors, Lear Corporation, Lithia Motors Inc., Meritor Inc, Mobileye NV, PSA Peugeot-Citroen, Renault, Sonic Automotive Inc, Tata Motors, Tesla Motors Inc..

Within the last 12 months, Morgan Stanley managed or co-managed a public offering (or 144A offering) of securities of Avis Budget Group Inc, BMW, Daimler, Fiat Chrysler Automobiles NV, Ford Motor Company, General Motors Company, Honda Motor, Hyundai Motor, Mobileye NV, Tata Motors, Tenneco Inc., Tesla Motors Inc., Toyota Motor, Volkswagen.

Within the last 12 months, Morgan Stanley has received compensation for investment banking services from Autoliv, Avis Budget Group Inc, BMW, Daimler, Delphi Automotive PLC, Fiat Chrysler Automobiles NV, Ford Motor Company, General Motors Company, Honda Motor, Hyundai Motor, Mobileye NV, Tata Motors, Tenneco Inc., Tesla Motors Inc., Toyota Motor, Volkswagen.

In the next 3 months, Morgan Stanley expects to receive or intends to seek compensation for investment banking services from American Axle & Manufacturing Holdings Inc, Apple, Inc., Autoliv, Avis Budget Group Inc, BMW, BorgWarner Inc., Daimler, Dana Holding Corp., Delphi Automotive PLC, Fiat Chrysler Automobiles NV, Ford Motor Company, General Motors Company, Goodyear Tire & Rubber Company, Google, Harley-Davidson Inc, Hertz Global Holdings Inc, Honda Motor, Hyundai Motor, Johnson Controls, Inc., Kia Motors, Lear Corporation, Magna International Inc., Mitsubishi Motors, Mobileye NV, Nissan Motor, PSA Peugeot-Citroen, Renault, Sonic Automotive Inc, Tata Motors, Tenneco Inc., Tesla Motors Inc., Toyota Motor, Volkswagen.

Within the last 12 months, Morgan Stanley has received compensation for products and services other than investment banking services from American Axle & Manufacturing Holdings Inc, Apple, Inc., Autoliv, Avis Budget Group Inc, BMW, BorgWarner Inc., Daimler, Dana Holding Corp., Delphi Automotive PLC, Fiat Chrysler Automobiles NV, Ford Motor Company, General Motors Company, Goodyear Tire & Rubber Company, Google, Harley-Davidson Inc, Hertz Global Holdings Inc, Honda Motor, Hyundai Motor, Johnson Controls, Inc., Lear Corporation, Meritor Inc, Nissan Motor, PSA Peugeot-Citroen, Tata Motors, Tenneco Inc., Toyota Motor, Volkswagen.

Within the last 12 months, Morgan Stanley has provided or is providing investment banking services to, or has an investment banking client relationship with, the following company: American Axle & Manufacturing Holdings Inc, Apple, Inc., Autoliv, Avis Budget Group Inc, BMW, BorgWarner Inc., Daimler, Dana Holding Corp., Delphi Automotive PLC, Fiat Chrysler Automobiles NV, Ford Motor Company, General Motors Company, Goodyear Tire & Rubber Company, Google, Harley-Davidson Inc, Hertz Global Holdings Inc, Honda Motor, Hyundai Motor, Johnson Controls, Inc., Kia Motors, Lear Corporation, Magna International Inc., Mitsubishi Motors, Mobileye NV, Nissan Motor, PSA Peugeot-Citroen, Renault, Sonic Automotive Inc, Tata Motors, Tenneco Inc., Tesla Motors Inc., Toyota Motor, Volkswagen.

Within the last 12 months, Morgan Stanley has either provided or is providing non-investment banking, securities-related services to and/or in the past has entered into an agreement to provide services or has a client relationship with the following company: American Axle & Manufacturing Holdings Inc, Apple, Inc., Autoliv, Avis Budget Group Inc, BMW, BorgWarner Inc., Daimler, Dana Holding Corp., Delphi Automotive PLC, Fiat Chrysler Automobiles NV, Ford Motor Company, General Motors Company, Goodyear Tire & Rubber Company, Google, Harley-Davidson Inc, Hertz Global Holdings Inc, Honda Motor, Hyundai Motor, Johnson Controls, Inc., Lear Corporation, Lithia Motors Inc., Meritor Inc, Nissan Motor, PSA Peugeot-Citroen, Renault, Tata Motors, Tenneco Inc., Tesla Motors Inc., Toyota Motor, Volkswagen.

Morgan Stanley & Co. LLC makes a market in the securities of American Axle & Manufacturing Holdings Inc, Apple, Inc., Asbury Automotive Group Inc, Autoliv, AutoNation Inc., Avis Budget Group Inc, BorgWarner Inc., Carmax Inc, Dana Holding Corp., Delphi Automotive PLC, Ford Motor Company, General Motors Company, Goodyear Tire & Rubber Company, Google, Group 1 Automotive, Inc, Harley-Davidson Inc, Harman International Industries Inc., Hertz Global Holdings Inc, Honda Motor, Johnson Controls, Inc., Lear Corporation, Lithia Motors Inc., Magna International Inc., Meritor Inc, Penske Automotive Group, Inc, Sonic Automotive Inc, Tata Motors, Tenneco Inc., Tesla Motors Inc., Toyota Motor.

The equity research analysts or strategists principally responsible for the preparation of Morgan Stanley Research have received compensation based upon various factors, including quality of research, investor client feedback, stock picking, competitive factors, firm revenues and overall investment banking revenues.

Morgan Stanley and its affiliates do business that relates to companies/instruments covered in Morgan Stanley Research, including market making, providing liquidity, fund management, commercial banking, extension of credit, investment services and investment banking. Morgan Stanley sells to and buys from customers the securities/instruments of companies covered in Morgan Stanley Research on a principal basis. Morgan Stanley may have a position in the debt of the Company or instruments discussed in this report.

Certain disclosures listed above are also for compliance with applicable regulations in non-US jurisdictions.

STOCK RATINGS

Morgan Stanley uses a relative rating system using terms such as Overweight, Equal-weight, Not-Rated or Underweight (see definitions below). Morgan Stanley does not assign ratings of Buy, Hold or Sell to the stocks we cover. Overweight, Equal-weight, Not-Rated and Underweight are not the equivalent of buy, hold and sell. Investors should carefully read the definitions of all ratings used in Morgan Stanley Research. In addition, since Morgan Stanley Research contains more complete information concerning the analyst's views, investors should carefully read Morgan Stanley Research, in its entirety, and not infer the contents from the rating alone. In any case, ratings (or research) should not be used or relied upon as investment advice. An investor's decision to buy or sell a stock should depend on individual circumstances (such as the investor's existing holdings) and other considerations.

Global Stock Ratings Distribution

(as of August 31, 2015)
For disclosure purposes only (in accordance with NASD and NYSE requirements), we include the category headings of Buy, Hold, and Sell alongside our ratings of Overweight, Equal-weight, Not-Rated and Underweight. Morgan Stanley does not assign ratings of Buy, Hold or Sell to the stocks we cover. Overweight, Equal-weight, Not-Rated and Underweight are not the equivalent of buy, hold, and sell but represent recommended relative weightings (see definitions below). To satisfy regulatory requirements, we correspond Overweight, our most positive stock rating, with a buy recommendation; we correspond Equal-weight and Not-Rated to hold and Underweight to sell recommendations, respectively.

	COVERAGE UNIVERSE		INVESTMENT BANKING CLIENTS (IBC)		
STOCK RATING CATEGORY	COUNT	% OF TOTAL	COUNT	% OF TOTAL IBC	% OF RATING CATEGORY
Overweight/Buy	**1206**	**36%**	**356**	**44%**	**30%**
Equal-weight/Hold	**1446**	**43%**	**352**	**44%**	**24%**
Not-Rated/Hold	**94**	**3%**	**11**	**1%**	**12%**
Underweight/Sell	**601**	**18%**	**83**	**10%**	**14%**
TOTAL	**3,347**		**802**		

Data include common stock and ADRs currently assigned ratings. Investment Banking Clients are companies from whom Morgan Stanley received investment banking compensation in the last 12 months.

Analyst Stock Ratings

Overweight (O). The stock's total return is expected to exceed the average total return of the analyst's industry (or industry team's) coverage universe, on a risk-adjusted basis, over the next 12-18 months.
Equal-weight (E). The stock's total return is expected to be in line with the average total return of the analyst's industry (or industry team's) coverage universe, on a risk-adjusted basis, over the next 12-18 months.
Not-Rated (NR). Currently the analyst does not have adequate conviction about the stock's total return relative to the average total return of the analyst's industry (or industry team's) coverage universe, on a risk-adjusted basis, over the next 12-18 months.
Underweight (U). The stock's total return is expected to be below the average total return of the analyst's industry (or industry team's) coverage universe, on a risk-adjusted basis, over the next 12-18 months.
Unless otherwise specified, the time frame for price targets included in Morgan Stanley Research is 12 to 18 months.

Analyst Industry Views

Attractive (A): The analyst expects the performance of his or her industry coverage universe over the next 12-18 months to be attractive vs. the relevant broad market benchmark, as indicated below.
In-Line (I): The analyst expects the performance of his or her industry coverage universe over the next 12-18 months to be in line with the relevant broad market benchmark, as indicated below.
Cautious (C): The analyst views the performance of his or her industry coverage universe over the next 12-18 months with caution vs. the relevant broad market benchmark, as indicated below.
Benchmarks for each region are as follows: North America - S&P 500; Latin America - relevant MSCI country index or MSCI Latin America Index; Europe - MSCI Europe; Japan - TOPIX; Asia - relevant MSCI country index or MSCI sub-regional index or MSCI AC Asia Pacific ex Japan Index.

Morgan Stanley Research does not provide individually tailored investment advice. Morgan Stanley Research has been prepared without regard to the circumstances and objectives of those who receive it. Morgan Stanley recommends that investors independently evaluate particular investments and strategies, and encourages investors to seek the advice of a financial adviser. The appropriateness of an investment or strategy will depend on an investor's circumstances and objectives. The securities, instruments, or strategies discussed in Morgan Stanley Research may not be suitable for all investors, and certain investors may not be eligible to purchase or participate in some or all of them. Morgan Stanley Research is not an offer to buy or sell or the solicitation of an offer to buy or sell any security/instrument or to participate in any particular trading strategy. The value of and income from your investments may vary because of changes in interest rates, foreign exchange rates, default rates, prepayment rates, securities/instruments prices, market indexes, operational or financial conditions of companies or other factors. There may be time limitations on the exercise of options or other rights in securities/instruments transactions. Past performance is not necessarily a guide to future performance. Estimates of future performance are based on assumptions that may not be realized. If provided, and unless otherwise stated, the closing price on the cover page is that of the primary exchange for the subject company's securities/instruments.
The fixed income research analysts, strategists or economists principally responsible for the preparation of Morgan Stanley Research have received compensation based upon various factors, including quality, accuracy and value of research, firm profitability or revenues (which include fixed income trading and capital markets profitability or revenues), client feedback and competitive factors. Fixed Income Research analysts', strategists' or economists' compensation is not linked to investment banking or capital markets transactions performed by Morgan Stanley or the profitability or revenues of particular trading desks.
The "Important US Regulatory Disclosures on Subject Companies" section in Morgan Stanley Research lists all companies mentioned where Morgan Stanley owns 1% or more of a class of common equity securities of the companies. For all other companies mentioned in Morgan Stanley Research, Morgan Stanley may have an investment of less than 1% in securities/instruments or derivatives of securities/instruments of companies and may trade them in ways different from those discussed in Morgan Stanley Research. Employees of Morgan Stanley not involved in the preparation of Morgan Stanley Research may have investments in securities/instruments or derivatives of securities/instruments of companies mentioned and may trade them in ways different from those discussed in Morgan Stanley Research. Derivatives may be issued by Morgan Stanley or associated persons.
With the exception of information regarding Morgan Stanley, Morgan Stanley Research is based on public information. Morgan Stanley makes every effort to use reliable, comprehensive information, but we make no representation that it is accurate or complete. We have no obligation to tell you when opinions or information in Morgan Stanley Research change apart from when we intend to discontinue equity research coverage of a subject company. Why the UAW can no longer afford close ratification votes

The issue is not whether the FCA-UAW tentative pact is a good contract in terms of worker's economics -- it is, relative to recent agreements. But it's still the wrong deal for winning ratification.

GM's new diesel pickups first to get extra scrutiny from EPA, CARB

GM has been told by the EPA and the California Air Resources Board that the new diesel-powered versions of the Chevrolet Colorado and GMC Canyon pickups will not be certified until they have been tested on the road as well as in the lab.

Subject: RE: VW Question from TN

Hi Mark -- Yes – the consumer q/a's posted on OTAQ's site should cover this –

http://www3.epa.gov/otaq/cert/violations.htm#tests

3 q's that touch on this question should help –

Is EPA officially requiring Volkswagen to issue a recall now?

No. EPA expects to compel VW to issue a recall in the future to reduce the emissions impacts of these vehicles. Owners will be notified of that recall once Volkswagen and Audi have developed a remedial plan and EPA has approved the plan. Manufacturers are given a reasonable amount of time to develop a plan to complete the repairs, including both the repair procedure and manufacture of any needed parts. Depending on the complexity of the repair and the lead time needed to obtain the necessary components, it could take up to one year to identify corrective actions, develop a recall plan, and issue recall notices.

Will I be required to have my vehicle repaired once it is recalled?

That depends. Some states require proof that emissions recalls have been performed prior to issuing the vehicle registration. Even in states that do not have this requirement, it is important to have emissions recalls performed because without the repairs, your vehicle may be emitting harmful pollutants in excess of the federal emission standards. You are not responsible for repair costs related to an emissions recall.

I live in an area that requires periodic emissions tests. What happens if my car fails?

It is unlikely that the presence of this device will cause your vehicle to fail. In fact, the defeat device was specifically designed to ensure that vehicles would pass inspection. The defeat device has been installed in the affected VW diesels since 2009. To date, EPA has no indication of any pattern failures with these vehicles during inspection and maintenance emission tests.

Subject: VW Question from TN

Hey, Folks. Had a message from Commissioner Bob Martineau (TN). His office is starting to get questions from residents about their need to renew tags, get emissions inspections, etc. on cars with defeat devices that have not yet been recalled/addressed – and they are wondering how they proceed under the circumstances.

Have we addressed those questions? Do we have something for Martineau's folks to have to be responsive?

Thanks,

Mark

Subject: Meeting request Christian Hey German Advisory Council on the Environment

Dear Anna,

Thanks again for the help re Volkswagen. I am now writing to you on a more positive matter. Christian Hey, general secretary of the German Advisory Council on the Environment (SRU) (http://www.umweltrat.de/EN/TheGermanAdvisoryCouncilOnTheEnvironment/thegermanadvisorycouncilonthee , an expert advisory body of the German Environment Agency (UBA) and the Federal Ministry of the Environment, will be in town next week (Sept 30). The SRU consists of government employees (Christian Hey is employed by the UBA) and appointed university professors who describe and assess environmental conditions, problems, and political trends and point out solutions and preventive measures. The SRU also submits an Environmental Report to the German federal government every four years. The report describes and assesses environmental policy developments and provides in-depth analyses of selected topics. Christian Hey is very interested in some comments your colleague William Jordan, deputy director in the office of pesticide programs, made recently on TTIP (see press article below). Do you think he would be available for a meeting? I am also wondering if Scot Hagerthey or one of his staff that worked on the ROE is interested to talk to Christian Hey about some of the environmental challenges they regard most pressing or they think are not so much on the public radar but warrant attention.

I've worked with Christian for a few years in one of my previous jobs in Berlin and can say that he is extremely knowledgeable on a wide range of topics.

Many thanks,

Michael

Inside U.S. Trade - 06/27/2014

EPA, Consumer Safety Regulator Express Skepticism About TTIP Benefits

Posted: June 26, 2014

Representatives of two U.S. regulatory agencies on June 24 expressed varying degrees of skepticism toward the idea of expanded regulatory cooperation with the European Union under a U.S.-EU trade deal, and raised fears that an agreement could slow down their rule making.

Robert Adler, acting chair of the U.S. Consumer Product Safety Commission (CPSC), said he worries including regulatory cooperation obligations in the Transatlantic Trade and Investment Partnership (TTIP) could make his agency even more hamstrung than it already is when it comes to issuing regulations.

Adler directly rebuffed the idea -- proposed by the European Commission -- that the trade deal should establish a new "Regulatory Cooperation Council" that would allow greater input from EU regulators and stakeholders in the U.S. regulatory process, and vice-versa.

Imposing such a procedure "could extend an incredibly cumbersome process that we face when we write regulations," Adler said. He explained that in 1981, Congress amended the CPSC's statute to require extensive cost-benefit analyses before publishing a rule. The consequence is that the agency has been able to issue only nine safety standards in the intervening 33 years, he said.

"The idea that we would then have to take a rule that we have spent so much time writing and go to an additional approval means that you're going to have many, many, many years of waiting for safety regulation. And I think that we all know that safety delayed is safety denied in too many respects," he said at an event in Washington hosted by the Transatlantic Consumer Dialogue (TACD).

Adler said some of his office's expert-level officials have been directly involved in the TTIP negotiations, and have helped to explain -- for example -- U.S. rules on flame-retardant treatments for textiles. He said the EU seemed satisfied enough with the explanation so as not to regard these rules as a trade barrier to be tackled through TTIP. But he expressed fear that other CPSC regulations may come into the crosshairs of negotiators.

Separately, William Jordan, deputy director in the office of pesticide programs at the Environmental Protection Agency (EPA), signaled skepticism toward TTIP regulatory cooperation efforts by saying it remains to be seen whether they will be "productive or a big waste of time."

Speaking on a different panel at the same TACD event, Jordan also acknowledged evaluating the potential impact of a rule on trans-Atlantic trade would add to a pile of more than a dozen assessments the EPA must conduct for other areas in publishing a rule, potentially slowing it down further.

"The fact that there may be trade impacts from a regulatory decision doesn't necessarily mean that it changes the regulatory decision, but it might mean that you look for different ways of achieving or implementing a goal," Jordan said.

"The downside that I see is adding yet one more kind of analysis to develop when taking a regulatory action … There are usually about 17 sections that go at the end of every rule making the EPA does. To go to another one adds just a little bit more work and has the potential to slow things down. I think the serious question is: Is it worth it?"

At the same time, Jordan said he sees some possible benefits from cooperating with the EU through its proposed Regulatory Cooperation Council.

He suggested doing so would be somewhat helpful, if only so U.S. officials could go to one forum and have access to all the relevant EU officials on a topic -- something he described as difficult given the EU's complicated bureaucracy. Working together on risk assessment for pesticides, for example, might also reduce the likelihood the U.S and EU would come to different decisions on risk management.

Adler, the acting CPSC chair, also raised questions about whether reducing regulatory differencesbetween the U.S. and EU in the consumer products sector, which includes things like apparel and toys, would really lead to added economic gains for businesses on either side of the Atlantic.

He said his experience has shown companies typically make their products to the highest standard of the markets they sell to, so they are compliant in all of them -- something he contended is good for consumers, and does not incur the expense of maintaining different inventories for different safety standards.

"I think the annoyance factor of different safety systems is huge with our friends in the business community. I personally remain skeptical that the out-of-pocket costs are as great as the annoyance," he said.

Adler added his agency does not have the staff or resources to figure out how standards could be aligned with regulations in other jurisdictions, although it does take international standards and best practices into account. He said he has exhorted businesses who complain about divergent rules to submit detailed petitions demonstrating the two approaches are consistent and harmonizing them would reduce costs. But he said he has received no response to date from businesses.

"What our friends really seem to want is for CPSC to survey the market, find equivalent standards, and lead the charge to make our systems compatible," he said. "In other words, they want us to be the moving party. And I'm going to be very frank: That's not going to happen."

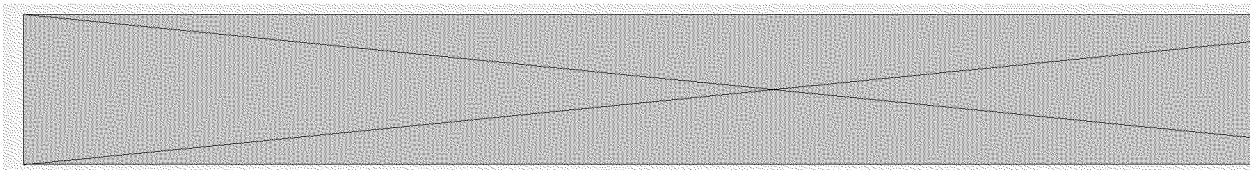
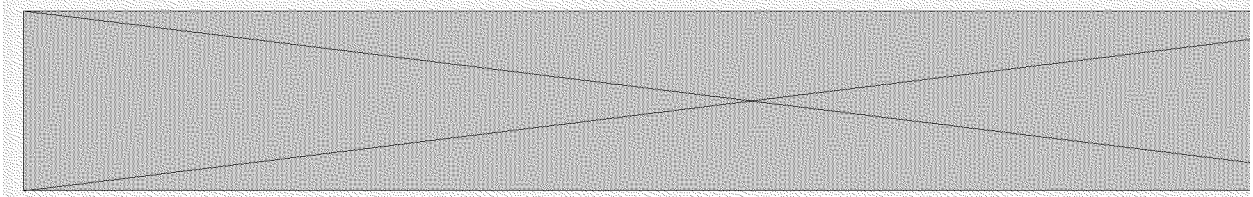
Subject: Overnight Energy & Environment: EPA targets oil refinery pollution





EPA TURNS TO REFINERIES: The Environmental Protection Agency released tough new rules cutting down on air pollution from petroleum refineries on Tuesday.

Cutting oil & gas methane makes cents. It creates quality manufacturing and service jobs, boosts America's small businesses and saves $1.2 billion in energy waste. Learn more www.EDF.org/methane

SPONSOR-GENERATED CONTENT

The agency said its new rule, which will be implemented in 2018, will reduce toxic air pollutants by 5,200 tons and cut 50,000 tons of volatile organic compounds from the air annually.

Officials are also requiring refiners to track the concentration of benzene, a toxic chemical, and warn the public about their levels.

The EPA pitched the new rules as a boon for public health.

"These updated Clean Air Act standards will lower the cancer risk from petroleum refineries for more than 1.4 million people and are a substantial step forward in EPA's work to protect the health of vulnerable communities located near these facilities," EPA Administrator Gina McCarthy said in the statement.

Oil groups said the agency incorporated some of its early comments on the rule into the final version, but still warned that the final rule will be expensive to implement.

"Despite these improvements, regulators need to be thoughtful about the additional impacts of new regulations and added costs to delivering affordable energy to U.S. consumers," API

Downstream Group Director Bob Greco said in a statement.

Read more here.

ON TAP WEDNESDAY I: The House Energy and Commerce Committee will meet to mark up its comprehensive energy reform bill.

ON TAP WEDNESDAY II: Jo Ellen Darcy, the Assistant Secretary of the Army, will testify on the Army Corps of Engineers' role in the crafting of a new Obama administration water regulation before a Senate Environment and Public Works subcommittee.

Rest of Wednesday's agenda ...

Four governors -- Steve Bullock (D-Mont.), Dennis Daugaard (R-S.D.), Gary Herbert (R-Utah) and Matt Mead (R-Wyo) -- will testify before the House Natural Resources Committee on energy development in their states.

NEWS BITE: Peter Lehner is leaving the Natural Resources Defense Council for Earthjustice.

Lehner has been the NRDC's executive director since 2006, but he will soon head a "sustainable food and agriculture program" at Earthjustice, the group said Tuesday.

"We are delighted to be welcoming back to Earthjustice a lawyer of Peter's extraordinary ability and creativity. He will be a great fit with the excellent Earthjustice team," the group's president, Trip Van Noppen, said in a statement announcing the move.

"His experience in government, public interest, and the private sector, combined with the reach of Earthjustice and its partners, will significantly increase our impact."

Leher worked on the NRDC's policy positions and advocacy and communications campaigns, according to the group, as well as leading the group's Action Fund political activities.

Of his new job Lehner said in a statement, "Agriculture affects our environment and climate, and food affects our health, more than almost any other activity. I am delighted to be rejoining Earthjustice to take advantage of the opportunities to work with allies among farmers, communities, and others to make our food and food production cleaner and safer."

Dear Attorney General Lynch, Administrator McCarthy, Attorney General Harris and Chair Nichols:

We write to express our concern about the health impacts of the emissions released by the defeat devices installed on Volkswagen's diesel vehicles and to recommend steps to mitigate the harm caused by these deliberate violations of the Clean Air Act and other laws. We are concerned that past enforcement actions have not fully mitigated the pollution caused by those violations. The mission of the American Lung Association is to save lives by improving lung health and preventing lung disease. We advocate for cleaner, healthier air to protect all, but especially the most vulnerable – children, seniors, and those with chronic lung disease.

We were deeply dismayed to read the Notice of Violation that documented the installation of defeat devices designed to circumvent the certification

test and dump excessive amounts of nitrogen oxides into the air.[1] Volkswagen's violations harm the public health and pollute the air. According to Bloomberg Business, the 482,000 noncompliant vehicles in the U.S. spewed almost 12,000 additional tons of nitrogen oxides into the air in one year, which, in total, "added the equivalent of as many as 19 million chemical-spewing cars to American roads."[2]

Since the 1960s, California has led the world to clean up motor vehicle pollution. The California Air Resources Board (ARB) and the U.S. Environmental Protection Agency (EPA) have collaborated to regularly update vehicle emissions standards to reduce air pollution and improve public health. The innovations to motor vehicle pollution control have changed the world and prevented millions of premature deaths. Key to this success are rigorous compliance and enforcement. Volkswagen's grave violation of the law has shaken the public confidence and increases the need for strong enforcement actions.

Through this enforcement action, we urge you to take all steps to mitigate the harm, punish those responsible, deter future violations of the law, increase the scientific understanding of near roadway air pollution and initiate steps to restore the public confidence in motor vehicle pollution control.

1. To mitigate the harm, every high emitting vehicle—all 482,000 cars—must be recalled and repaired to guarantee compliance with the emissions standards. Volkswagen must be obligated to create incentives to capture all of the vehicles including, if needed, a requirement to buy back those vehicles from their current owners and to retire those vehicles. If each vehicle is not repaired or retired, communities will be burdened by these excess emissions for another generation until the vehicles ultimately retire. EPA and ARB must develop a robust in-use testing protocol to ensure that if the vehicles are repaired, the vehicles remain in full compliance for the vehicles' full useful life, in real world driving conditions. The emissions control system must not be allowed to degrade over time to exceed the standards, and EPA and ARB must assure the public that there is no further cheating by Volkswagen.

2. Because of the magnitude of the excess emissions, reported to be as much as forty times the standard, the recall and repair must be promptly implemented with a short time limit for compliance. These vehicles pose a real and ongoing threat to public health. We recommend no more than 90 days for the recall and repair or scrappage of this fleet. These super-emitters cannot be allow to continue to pollute the air.

3. EPA and ARB must determine the magnitude of the excess emissions caused by the vehicles from the date of the sale of the first vehicle through the effective repair or scrappage of the last vehicle. Volkswagen must be required to offset all the excess emissions through verified, enforceable pollution reductions. These offsets must be real,

---

[1] Brooks, P (2015, September 18) *Notice of Violation Letter to Volkswagen* http://www3.epa.gov/otaq/cert/documents/vw-nov-caa-09-18-15.pdf

[2] Levin, A, and Plungis, J (2005, September 23) *VW Cheating Added Pollution of as Many as 19 Million U.S. Cars*, Bloomberg Business http://www.bloomberg.com/news/articles/2015-09-23/vw-cheating-added-pollution-of-as-many-as-19-million-u-s-cars

new emissions reductions, not, for example, purchasing shut down credits. Because much of the burden of the excess pollution falls on communities who live near roadways, the offsets must reduce emissions in those communities with the highest air pollution burden.

4. All of the correspondence, testing results and documents from Volkswagen, EPA and ARB must be released and made available to the public. This transparency will help to inform the public and policy makers as we work to strengthen enforcement and provide additional resources to support compliance with applicable laws. The public has a right to know why it took six years to identify these violations and what steps Volkswagen took to cover up the violation or delay the investigation.

5. To ensure that the full scope of the violations are known, to deter future violations of the law and to restore public trust, EPA and ARB should verify all Volkswagen vehicle certifications. EPA and ARB should audit the existing fleet of all Volkswagen vehicles (including all their other brands) for all Tier 2 model years 2004 through 2016, and prior to certification, all new models of all of the Volkswagen brands for the Tier 3 standards, model years 2017 through 2025, should be tested with a rigorous on-road testing protocol as well.

6. If there is a settlement, steps must be taken to mitigate the burden for the public and to further deter future conduct by Volkswagen or others. We urge that any resolution include Supplemental Environmental Projects that are consistent with the EPA guidance to "obtain environmental and public health protection and benefits that may not otherwise have occurred in the settlement of an enforcement action."[3] We recommend that substantial and significant additional pollution offsets be required in those communities with the highest air pollution burden. We believe that an additional five tons of nitrogen oxide should be cleaned up for each potential excess ton of nitrogen oxide these vehicles emitted. If the recall, repair or scrapping of the existing fleet does not achieve full compliance, any pollution attributed to non-participation of vehicles over their full lifetimes should be offset by ten tons of pollution cleaned up for every ton of pollution from the super-emitting vehicles. This will help to deter future cheating by Volkswagen and send a strong signal to other companies that the consequences of cheating are significant.

   These reductions could take the form of incentives to promote zero emission vehicles and the infrastructure needed to support zero emission vehicle (ZEV) technology, the retrofitting with NOx controls or retirement of older diesel engines, other measures that reduce mobile source pollution in communities, or other real, enforceable and tangible pollution reductions.

7. A resolution to these violations should also support efforts to increase the understanding of the health impacts of motor vehicle pollution and enhance near roadway air pollution monitoring. In 2010, the Health Effects Institute published *Traffic-Related Air Pollution: A Critical Review of the Literature on Emissions, Exposure, and Health Effects* that concluded:

[3] Giles, G (2015, March 10, *Issuance of the 2015 Update to the 1998 U.S. Environmental Protection Agency Supplemental Environmental Projects Policy* [Memoradum] Washington, DC: U.S. Environmental Protection Agency http://www2.epa.gov/sites/production/files/2015-04/documents/sepupdatedpolicy15.pdf

the evidence is sufficient to support a causal relationship between exposure to traffic-related air pollution and exacerbation of asthma. It also found suggestive evidence of a causal relationship with onset of childhood asthma, nonasthma respiratory symptoms, impaired lung function, total and cardiovascular mortality, and cardiovascular morbidity.[4]

Volkswagen should be required to fund, but not control in any way, an independent near roadway research program to improve the understanding of the impact of motor vehicle emissions on the public health. In addition, Volkswagen should fund state and local air pollution control agencies to expand their near road air pollution monitoring programs. Currently there are only 126 near road monitors including less than 20 in California. We recommend tripling this network and funding its operation for twenty years. This monitoring and research effort would further inform compliance, enforcement and policy to improve public health.

In conclusion, protecting public health demands cleaner air. California and federal law have significantly reduced air pollution from motor vehicles, yet millions of people still are exposed to unhealthy air pollution. Polluters who violate the public trust and the law must be held accountable. Any resolution to this case must mitigate all the harm and include significant measures to prevent and deter future misconduct.

The excessively polluting vehicles must not be permitted to continue to operate without being repaired to comply with their certification standards. Every gram of excess pollution created by these violations must be offset in the communities where the public bears the greatest air pollution burden. Additional significant pollution reductions must be made to help to compensate the public for the additional air pollution burden and to deter future misconduct. All Volkswagen vehicles from 2004 through 2025 should be subject to rigorous in-use compliance tests to ferret out any additional cheating and to deter future misconduct. In the interest of transparency, there must be full disclosure of all information related to these violations. And, Volkswagen should fund research and monitoring to improve the understanding of the health impacts of near roadway exposures.

Please contact Paul Billings, Senior Vice President, Advocacy and Education, at 202-785-3355 or Paul.Billings@Lung.org if you need any additional information.

Sincerely,

Harold Wimmer

Subject: FW: Automotive News re: Questions re EPA in-use emissions test protocol

HI Janet and Byron,

Another Q from AutoNews.

I had a few follow-ups to Chris Grundler's comments from Friday's conference call. He mentioned several ways that EPA works to verify emissions COC submissions.

Here's the section I have questions about

EPA also tests vehicles they borrow from private owners to ensure they match the certified design and align with data submissions, and they also audit vehicles selected at random from manufacturers production lines to confirm GHG and fuel economy

Also do in-use investigations to evaluate performance on the road.

How many light-duty vehicles annually fall under each category that I've highlighted?

Liberté • Égalité • Fraternité
RÉPUBLIQUE FRANÇAISE

MINISTÈRE DE L'ÉCOLOGIE, DU DÉVELOPPEMENT DURABLE
ET DE L'ÉNERGIE

La ministre

Paris, le 22 septembre 2015

Madame l'Administratrice,

Le 18 septembre 2015, l'agence fédérale américaine de protection de l'environnement (US Environmental protection agency - EPA) a publié un avis d'infraction à la réglementation américaine en matière d'émission (Clean Air Act) par le groupe Volkswagen pour la production et la vente de voitures équipées de moteur 2L diesel émettant jusqu'à 40 fois plus que la limite d'émission autorisée des oxydes d'azote (NOx).

L'EPA considère que le groupe a introduit sur le marché américain, entre 2009 et 2015, des véhicules équipés d'un dispositif d'invalidation au sens de la réglementation en vigueur. VW aurait installé, sur les véhicules incriminés, un logiciel détectant que le véhicule subit un contrôle de conformité aux émissions polluantes et permettant d'activer des dispositifs antipollution de traitement des NOx lors du contrôle, alors que ces dispositifs antipollution sont inactifs en situation de conduite réelle. En Europe, le règlement (CE) n°715/2007, fixant notamment les limites réglementaires des polluants des normes Euro 5 et 6, interdit dans son article 5 l'usage de *dispositifs d'invalidation qui réduisent l'efficacité des systèmes de contrôle des émissions.*

Les éléments mis en avant par l'EPA sont préoccupants. Compte-tenu de leur ampleur, j'ai le devoir, en tant qu'autorité chargée du contrôle des normes antipollution, de m'assurer que de telles pratiques n'ont pas eu cours sur le territoire français. Il convient de s'assurer que les véhicules homologués en France respectent la réglementation en vigueur. Aussi, je souhaite qu'un retour d'expérience puisse être tiré au plus vite des investigations menées aux Etats-Unis, afin que les contrôles réalisés sur les émissions de polluants des véhicules mis en circulation soient parfaitement fiables.

Madame Gina McCarthy
Administratrice de l'US EPA
1200 Pennsylvania Avenue, N.W.
Washington,DC 20460
ETATS-UNIS

VW FOIA, EPA 06/20/2017 2017-FFP_027869

J'ai donc demandé à l'organisme certificateur français, UTAC-CERAM, de se rapprocher de vos services pour bénéficier de leur expertise. Sur la base des renseignements que vous voudrez bien leur communiquer, j'étudierai avec la plus grande attention la possibilité de mettre en place en France un protocole d'investigations qu'il conviendra de conduire pour identifier de telles fraudes.

En vous remerciant par avance, je vous prie d'agréer, Madame l'Administratrice, l'assurance de mes sentiments les meilleurs.

Ségolène ROYAL

Paris, September 22, 2015

Dear Ms. McCarthy,

On September 18, 2015, the U.S. Environmental Protection Agency (EPA) published a notice of violation of the Clean Air Act by the Volkswagen Group for the production and sale of vehicles equipped with 2-liter diesel engines emitting up to 40 times the permitted emission limits for nitrogen oxides (NOx).

The EPA believes that between 2009 and 2015 the group introduced into the American market vehicles equipped with a defeat device to circumvent current regulations. VW reportedly installed in the implicated vehicles software that detected that the vehicle was being tested for compliance with harmful emissions standards and made it possible to activate NOx emission control devices during the inspection, while these emission control devices are inactive during normal driving situations. In Europe, regulation (EC) No 715/2007, which notably sets the regulatory limits for pollutant emissions in line with Euro 5 and 6 standards, prohibits in article 5 the use of defeat devices that reduce the effectiveness of emission control systems.

The information released by the EPA is troubling. Given the magnitude of the problem, it is my duty as the authority tasked with monitoring antipollution standards to ensure that such practices are not occurring on French soil. We must make sure that vehicles approved in France abide by current regulations. I would therefore like to obtain feedback from the U.S. investigations as quickly as possible to ensure the absolute reliability of emissions inspections for vehicles on the road.

I have therefore asked the French certification body, UTAC-CERAM, to contact your agency, in order to benefit from its expertise. Based on the information you kindly could provide to us, I will closely study the possibility of establishing a protocol, in France, for the appropriate investigations to be conducted to identify such fraudulent practices.

Thanking you in advance, I remain yours sincerely,

Ségolène Royal

Subject: Asahi Shimbun Inquiry - fact-checking Volkswagen disclosures per Reuters story

Hi Mr. Grundler,
My name is Hanqing and I'm a reporter with Asahi Shimbun, a major Japanese newspaper. I wanted to reach out because we're working on a story about the Volkswagen emissions scandal, and wanted to fact-check a story from Reuters

reporting that Volkswagen officials first disclosed to EPA officials that "it hacked its own cars to deceive U.S. regulators about how much their diesel engines pollute" on Aug. 21.

The story cited various anonymous sources, so we're reaching out to you specifically because in this story, Reuters reports that "Minutes before Christopher Grundler, director of the EPA's transportation and air quality office, was to deliver a 9 a.m. ... a Volkswagen representative told him about the deception."

Here's what I'm looking for:

1. I was wondering if you could confirm this version of events, and what exactly Volkswagen representatives disclosed -- the way it is phrased in the Reuters story implies that they were admitting purposeful internal acts of deception on their part. Is this an accurate portrayal of what was communicated to you?

A couple of other facts that I was wondering if you could comment on/confirm, from the same Reuters report:

2. "At the same meeting, representatives of the California Air Resources Board ... were also given a verbal notice of the deception." - was CARB also given notice on Aug. 21, at the same meeting?

3. "The delay between VW's confession and the U.S. exposure of the scandal occurred as regulators prepared their response to the disclosure." - what caused the delay between Volkswagen's disclosure and EPA's public announcement?

Feel free to reach me by phone at 212.944.5669 or at this email. Thank you for your time and hope to hear from you soon.

Best,
Hanqing

The Clean Power Plan Will Survive: Part 2

In the legal battle between supporters and opponents of the U.S. Environmental Protection Agency's Clean Power Plan, there are no elephants hiding in mouseholes. Indeed, states are not required to do anything at all — they are simply given the option of tailoring an implementation plan to their specific circumstances, says Patrick Parenteau, a professor at Vermont Law School.

LEGAL INDUSTRY

The 10 Most Charitable Law Firms

The 10 law firms that made the largest charitable donations in 2014 according to a Law360 survey gave back to their communities by funneling millions of dollars into worthy organizations and programs to fund legal aid efforts, education programs and services for the disadvantaged. Here, Law360 looks at the firms that gave the most and what drives their charitable giving.

Most Feared Plaintiffs Firm: Bernstein Litowitz

Bernstein Litowitz Berger & Grossmann LLP has racked up hundreds of millions of dollars in recoveries this past year, including a $500 million settlement over Bear Stearns' sale of mortgage-backed securities, earning it a place among Law360's Most Feared Plaintiffs Firms.

Trial Ace: Williams & Connolly's Dane Butswinkas

From guiding HBO through one of the largest defamation cases in history to winning a landmark antitrust verdict for AstraZeneca, Williams & Connolly LLP's Dane Butswinkas has brought dedication, humility and an old-school trial focus to all his work.

The 3 Biggest Blunders With Attorney-Client Privilege

Determining when attorney-client privilege applies can be so tricky that a judge may have to adjudicate the matter, as seen in the depositions in the General Motors ignition switch multidistrict litigation. Here, attorneys offer advice on when the shield applies and how to keep documents bearing legal advice under wraps.

Dewey Jurors Stuck In Mud, But Judge Has Little Recourse

Jurors in the Dewey & LeBoeuf LLP trial appeared hopelessly confused Tuesday after sending a note requesting a definition of "deliberations" and asking what their "job" was, but experts said the judge has few options to get the panel out of its rut.

Dewey Jurors Voice Confusion Over Role At Trial

Jurors in the trial of the former executive leadership of Dewey & LeBoeuf LLP on Tuesday concluded their eighth full day of deliberations without reaching a verdict and appeared confused over their role as deciders of fact.

TOP NEWS

EPA Imposes Fence Line Monitoring On Petroleum Refineries

The U.S. Environmental Protection Agency on Tuesday announced final air emissions regulations for petroleum refineries that for the first time require monitoring at facility fence lines.

Pfizer Unit Pays $194M To End NJ Superfund Cleanup Row

A Pfizer Inc. subsidiary is paying $194 million to settle a New Jersey federal suit in which the U.S. Environmental Protection Agency sought to recover costs over the cleanup of hazardous substances at a Superfund site, the EPA said on Tuesday.

High Court Asked To Rule On Animal Feedlot Air Regs

A group of Iowa residents has asked the U.S. Supreme Court to revive its lawsuit accusing the U.S. Environmental Protection Agency of taking too long to list pollutants from animal feedlots as sources of pollution under the Clean Air Act.

DC Circ. Says US Needn't Review Enbridge Pipeline

The D.C. Circuit on Tuesday backed a lower court's dismissal of the Sierra Club's challenge of a crude oil pipeline built by Enbridge Inc., concluding that the federal government had no obligation to conduct an environmental review of the project since it is almost exclusively on private land.

Coalition Says Wyo. 'Data Censorship' Laws Unconstitutional

A coalition including conservation and animal-protection groups hit Wyoming Attorney General Peter K. Michael and five other Wyoming officials with a suit in Wyoming federal court on Tuesday, seeking to strike down two Wyoming state laws they say prevent private citizens from collecting "resource data" on public or private land without permission.

DOI Readies Biggest Alaska Oil Lease Sale Yet

The U.S. Department of the Interior announced its annual lease sale in Alaska's 23-million-acre National Petroleum Reserve, saying Tuesday the sale considers tribal subsistence activities and the U.S. has garnered $261 million from leases in the area over the past 15 years.

DOT Delays Inspection Mandate In Pipeline Safety Final Rule

The U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration on Tuesday delayed indefinitely part of its final rule on pipeline safety regulations after industry trade groups raised concerns about proposed construction inspection procedures and the purported safety benefits.

Calif. AG Wants Public To Benefit From Toxic-Chemical Suits

California Attorney General Kamala D. Harris said Tuesday she wants to change how the state enforces Proposition 65, a law requiring businesses to post signs warning of carcinogens and reproductive toxins, to crack down on frivolous litigation and cap "in lieu of penalties" payments.

House Committee Wants VW Docs On Emissions Software

The House Energy and Commerce Committee told Volkswagen on Tuesday to submit documents including its internal communications about the use of a software that the U.S. Environmental Protection Agency has found allows its diesel vehicles to cheat on emissions tests.

ENFORCEMENT

Duke Strikes $20M Deal Over NC Coal Ash Cleanup

North Carolina environmental officials said Tuesday that Duke Energy Corp. will pay approximately $20 million in penalties and cleanup costs to resolve allegations of groundwater contamination at its coal ash facilities in the state, though that's less than the $25.1 million fine with which regulators originally hit the utility giant.

LITIGATION

Calif. Sues Shell, Feds For $52M Rubber Plant Cleanup

The United States and Shell were hit Tuesday with a lawsuit brought by California Attorney General Kamala Harris, claiming the state should be reimbursed for its work at a Superfund site in Los Angeles, a mess federal officials estimate will cost up to $52 million to clean up.

3rd Circ. Calls Pa. Clean Air Plan Troubled, Remands To EPA

improperly gave its blessing to a Pennsylvania air pollution mitigation plan that environmental groups claimed didn't impose any meaningful controls on major sources of emissions.

Alcoa Wins Dispute With NC Over Hydro Riverbed Rights

A North Carolina federal judge on Monday tossed a property suit brought by the state challenging an Alcoa Inc. unit's rights to the land on which it had built four hydropower dams along the Yadkin River, finding that Alcoa had proved it had title to the land.

States Argue Against Pausing Challenge To Clean Water Rule

North Dakota and other states asked a federal judge Monday not to stay their lawsuit challenging a new rule clarifying the scope of the Clean Water Act, saying the federal government wouldn't suffer any harm if the case proceeded.

Nev. Counties, Mining Cos. Seek Pause Of Sage-Grouse Plans

Two Nevada counties and two mining companies moved Monday for a preliminary injunction in a dispute with the federal government over resource management plans intended to partly help preserve the greater sage-grouse, arguing that they face imminent harm.

BLM's Denial Of Mountaintop Communications Tower Upheld

A Nevada federal judge on Monday upheld the U.S. Bureau of Land Management's decision rejecting a commercial mobile radio provider's application to build a communications tower on a mountain near Las Vegas, saying its non-impairment criteria was fairly applied.

DEALS

NJ Awards $7.6M Post-Sandy River Dredging Contract

The New Jersey Department of Transportation said on Monday that it has awarded a $7.6 million contract to dredge the Shark River in Monmouth County after the effects of Superstorm Sandy created a greater need to complete the long-delayed project.

BANKRUPTCY

Canadian Energy Firm Atlantic Hydrogen Hits Bankruptcy

Atlantic Hydrogen Inc., a Canadian energy company that has developed technology to eliminate carbon gas while producing hydrogen, on Tuesday said that it will file for bankruptcy and look to sell its assets, joining several energy firms in North America that have sought court protection this year.

The Clean Power Plan Will Survive: Part 2

In the legal battle between supporters and opponents of the U.S. Environmental Protection Agency's Clean Power Plan, there are no elephants hiding in mouseholes. Indeed, states are not required to do anything at all — they are simply given the option of tailoring an implementation plan to their specific circumstances, says Patrick Parenteau, a professor at Vermont Law School.

LEGAL INDUSTRY

The 10 Most Charitable Law Firms

The 10 law firms that made the largest charitable donations in 2014 according to a Law360 survey gave back to their communities by funneling millions of dollars into worthy organizations and programs to fund legal aid efforts, education programs and services for the disadvantaged. Here, Law360 looks at the firms that gave the most and what drives their charitable giving.

Most Feared Plaintiffs Firm: Bernstein Litowitz

Bernstein Litowitz Berger & Grossmann LLP has racked up hundreds of millions of dollars in recoveries this past year, including a $500 million settlement over Bear Stearns' sale of mortgage-backed securities, earning it a place among Law360's Most Feared Plaintiffs Firms.

Trial Ace: Williams & Connolly's Dane Butswinkas

From guiding HBO through one of the largest defamation cases in history to winning a landmark antitrust verdict for AstraZeneca, Williams & Connolly LLP's Dane Butswinkas has brought dedication, humility and an old-school trial focus to all his work.

The 3 Biggest Blunders With Attorney-Client Privilege

Determining when attorney-client privilege applies can be so tricky that a judge may have to adjudicate the matter, as seen in the depositions in the General Motors ignition switch multidistrict litigation. Here, attorneys offer advice on when the shield applies and how to keep documents bearing legal advice under wraps.

Dewey Jurors Stuck In Mud, But Judge Has Little Recourse

Jurors in the Dewey & LeBoeuf LLP trial appeared hopelessly confused Tuesday after sending a note requesting a definition of "deliberations" and asking what their "job" was, but experts said the judge has few options to get the panel out of its rut.

Dewey Jurors Voice Confusion Over Role At Trial

Jurors in the trial of the former executive leadership of Dewey & LeBoeuf LLP on Tuesday concluded their eighth full day of deliberations without reaching a verdict and appeared confused over their role as deciders of fact.

Subject: Federal EV Strategy Idea - borrowing from Auto / Oil program from years ago . . .

Dear Chris and Karl,
I'm at a conference in London on cities and climate action, while trying to continue to manage our global response to the VW scandal - quite a challenge.

One interesting idea that was floated during a side conversation with Anthony Eggert (CWF) - in response to the side meeting we had together with CARB and NRDC at Asilomar on EVs - would be to duplicate the successful industry - government collaboration years ago under Auto Oil with the creation of a new collaboration between the Auto and Utility industry to pursue methods on how to support integration of EVs in the US.

This is just the shell of an idea at the moment, but to me it has an immediate allure. What's the current proposal?

Who would be involved?

1. Federal engagement would include a number of agencies, including DOE, WH, EPA, etc.

2. Utilities engagement could include Southern CA Edison, EPRI, FERC, etc.

3. Auto industry representatives would be individual companies as well as associations.

4. State involvement would be particular important, and should include CA and 177 States.

5. ICCT would of course appreciate a role, likely with a couple other NGOs - NRDC, California Plug-in Partnership, NESCAUM, etc.

What would this group be assigned to do?

The Auto / Oil group collected a massive amount of data that was used to create the Complex Model which formed the basis for the RFS years ago.

We are at the early stages here, but I would like that this group would collect data on the nexus of EVs with utility emissions, plus the benefits of various policy options, which work and why, which don't and why not. . . . .

Obviously, this is early days in this idea, but I think it's a good concept, and wanted to share with you to get your thinking.

Best

Drew

NEWS UPDATE September 30, 2015

Republicans demand info on USDA support for ethanol

By Amanda Reilly, E&E reporter • • Posted September 30, 2015

At issue, they said, were Vilsack's comments about a new $100 million program to help gas stations install pumps capable of handling gasoline containing up to 85 percent ethanol. USDA announced the awards Sept. 10 to gas retailers in 21 states. [read more …]

Ex-Sen. Talent launches advocacy group to boost RFS

Amanda Reilly, E&E reporter • • Posted September 30, 2015

Former Sen. Jim Talent (R-Mo.) today will launch a new group to boost the nation's biofuel policy. The group, Americans for Energy Security and Innovation, will seek to mobilize elected officials in support of the renewable fuel standard, which Congress first passed in 2005 and significantly expanded in 2007 to require the use of ethanol and advanced biofuels by refiners. [read more …]

Volkswagen to refit cars affected by emissions scandal

BY ANDREAS CREMER, Reuters • • Posted September 30, 2015

Volkswagen said on Tuesday it will repair up to 11 million vehicles and overhaul its namesake brand following the scandal over its rigging of emissions tests. New Chief Executive Matthias Mueller said the German carmaker would tell customers in the coming days they would need to have diesel vehicles with illegal software refitted, a move which

some analysts have said could cost more than $6.5 billion.
[read more …]

The green car myth?

By Kalina Oroschakoff and Sara Stefanini, Politico • • Posted September 30, 2015

A new investigation showing higher-than-expected carbon dioxide emissions from gasoline-powered as well as diesel-powered cars is raising pressure on EU governments to examine whether a broader range of vehicles was also equipped with the cheating software that Volkswagen admitted to installing in its diesel vehicles.
[read more …]

Greens ready to litigate as EPA preps ozone standard

Amanda Reilly, E&E reporter • • Posted September 30, 2015

Environmentalists are threatening legal action if U.S. EPA fails to finalize a new ozone standard that they believe protects public health. EPA is said to be ready this week to finalize a standard of 70 parts per billion — a number that greens find lacking. "The 70-part-per-billion option would be just blatantly unlawful," said David Baron, managing attorney at Earthjustice. [read more …]

Obama admin cracks down on refinery emissions

Amanda Reilly, E&E reporter • • Posted September 30, 2015

Petroleum refineries will be forced to curb toxic air emissions and beef up monitoring under a rule finalized today by U.S. EPA. Released this afternoon ahead of a court-ordered deadline tomorrow, the rule encompasses New Source Performance Standards and maximum achievable control technology for refineries under the Clean Air Act. [read more …]

Jeb Bush to back oil exports in energy plan

Jennifer Yachnin, E&E reporter • • Posted September 30, 2015

"Lifting the ban on crude oil exports and liberalizing natural gas exports would create hundreds of thousands of additional jobs and significantly lower net energy costs," Bush wrote in a preview of his plan provided to the Associated Press. [read more …]

Subject: Morning Consult Energy: House E&C Members Want Info from VW, EPA on Emissions Scandal; Chesapeake Energy Cuts 15% of Its Workforce

By Colleen Leahy

Today's Washington Brief

- Members of the House Energy and Commerce Committee wrote letters to Volkswagen and the Environmental Protection Agency requesting documents on the emissions scandal. The bipartisan group of lawmakers said it wants more information before holding a hearing on Volkswagen's alleged Clean Air Act violations. (The Hill)

- The EPA finalized a rule that will tighten emissions standards for oil refineries, placing stricter limits on carcinogenic chemicals such as benzene. The rule will be implemented in 2018. (Reuters)

- The EPA is preparing to finalize another emissions rule, this one for ozone, a pollutant that causes smog and is linked to asthma and other respiratory illnesses. The finalized rule is set to be released on Thursday. (The Associated Press)

Today's Business Brief

- Chesapeake Energy, the second-largest U.S. natural gas producer, will cut 15 percent of its workforce — 740 jobs — amid the downturn in oil prices. The company has already cut capital spending by about 40 percent this year. (Reuters)

- Utility Duke Energy will pay North Carolina $7 million to resolve claims of groundwater problems at the company's coal-ash sites in the state. The state said the agreement will also lead to an additional $10-$15 million for reparations from Duke. (The Wall Street Journal)

- The world's largest mining company, BHP Billiton, said it expects to continue mining coal for decades to come in spite of an anticipated international climate accord in Paris later this year, and that such an accord would not damage its profits. (The Guardian)

General

House committee wants more info from Volkswagen, EPA
Devin Henry, The Hill

Top Republicans and Democrats on the House Energy and Commerce Committee are asking federal regulators and Volkswagen officials for more information on the car manufacturer's alleged efforts to circumvent environmental rules. The group of lawmakers — Chairman Fred Upton (R-Mich.) and Reps. Frank Pallone (D-N.J.), Tim Murphy (R-Penn.) and Diana DeGette (D-Colo.) — sent VW and the Environmental Protection Agency (EPA) letters asking for documents and information related to the emissions scandal.

EPA prepares to tighten limits on smog-causing ozone as businesses gear up to fight the change
Matthew Daly, The Associated Press

The current federal limit on smog-forming pollution linked to asthma and respiratory illness "is not adequate to protect the public health," a top environmental regulator said Tuesday. Janet McCabe, acting assistant administrator of the Environmental Protection Agency, said a new, stricter standard is needed to cut dangerous ozone pollution and prevent thousands of asthma attacks, emergency room visits and even premature deaths.

EPA expects success from new methane rules
Devin Henry, The Hill

A top environmental regulator said Tuesday that he expects new federal standards for methane emissions will succeed in cutting down on the potent greenhouse gas. Joseph Goffman, the associate assistant administrator at the Environmental Protection Agency's (EPA) Office of Air and Regulation, said Tuesday that the agency's new methane standards, combined with expanded voluntary programs, will help the natural gas industry reduce its methane emissions.

In smog battle, industry gets help from unlikely source: black business group
Joby Warrick, The Washington Post

For years, the air over central Pittsburgh has ranked among the country's dirtiest, with haze and soot that regularly trigger spikes in asthma attacks, especially among the urban poor. So it might have seemed odd that a black business group would choose this spot to denounce proposed restrictions on smog.

Jeb Bush goes heavy on fossil fuels
Darren Goode, Politico

Jeb Bush released an energy plan Tuesday that was filled with Republican standards: Drill more oil, cut regulations and build the Keystone XL pipeline. But it's more notable for what it dodges: Bush is one of the greenest candidates in the Republican presidential field.

U.S. Futures Rally as S&P 500 Nears Its Worst Quarter Since 2011
Alex Longley, Bloomberg News

U.S. stock-index futures jumped, mirroring a rebound in equities around the world after a quarterly slump that wiped almost $11 trillion off the value of global shares. S&P 500 E-mini contracts expiring in December rose 1.3 percent to 1898 at 7:15 a.m. in New York.

Oil & Natural Gas

Oil down on large U.S. crude stockpile build
Karolin Schaps, Reuters

Oil prices slipped on Wednesday after an unexpectedly big build in U.S. crude inventories, further evidence of an oversupply that has helped halve global spot prices over the last year.

Chesapeake cuts 15 percent of workforce on oil slump
Anna Driver, Reuters

Chesapeake Energy Corp said on Tuesday it has cut about 15 percent of its workforce, or 740 jobs, as depressed oil and gas prices force deeper cost cutting at the U.S. No. 2 natural gas producer. The company, which now has about 4,000 workers, has already slashed capital spending this year by about 40 percent and cut operating costs as well as its dividend as crude prices that make drilling unprofitable linger for months.

U.S. rule to cut toxic emissions at refineries
Timothy Gardner, Reuters

U.S. oil refineries will face tighter standards in coming years on toxic emissions that cause lung problems and increase cancer risks, environmental regulators said on Tuesday. The Environmental Protection Agency finalized a rule, to be fully implemented in 2018, that aims to reduce emissions of benzene and other toxic emissions.

Judges rule NEPA study not needed for oil sands project
Robin Bravender, E&E

Federal judges denied environmentalists' challenge to a 600-mile pipeline carrying oil sands crude from Illinois to Oklahoma. Attorneys from the Sierra Club and National Wildlife Federation told the court that the government should have conducted more thorough environmental assessments of Enbridge Inc.'s Flanagan South pipeline, but the three-judge appeals panel rejected their argument.

Mexico Strains to Lure World's Oil Giants
Bill Spindle and Laurece Iliff, The Wall Street Journal

Today Mexico will auction off nine fields in the shallow-water Gulf of Mexico in what analysts consider its best chance this year to attract private and foreign oil companies, which have been kept out for almost eight decades. The fields have proven and probable reserves, meaning that commercial quantities of oil have already been found, and are in an area where production costs have traditionally been below $20 a barrel.

Shell's Arctic miss is just the oil industry's latest dry hole
Jennifer A. Dlouhy, Houston Chronicle

Shell is far from alone in making a big bet on an offshore play only to end up with disappointing results. From the Gulf of Mexico to the shores of Angola, offshore exploration has yielded plenty of dry holes.

Utilities & Infrastructure

DOE seeks to focus national lab research on top cyber, grid priorities
Peter Behr, E&E

A unique collaboration among the Energy Department's national laboratories is seeking to close high-priority technology gaps facing the U.S. power grid, as it deals with disruptive operating changes and cybersecurity threats. Today is the deadline for federal laboratories to submit bids for research grants to initiate the program.

Utilities want Koster to fight Obama's climate change rules
Jacob Barker, St. Louis Post-Dispatch

Missouri Attorney General Chris Koster has yet to say whether he will fight the Obama administration's landmark carbon rules, but the state's electric utilities are urging him to take their side. They sent Koster, a Democrat running for Missouri governor in 2016, a letter Monday asking him to join other states that have mounted legal challenges to the regulations.

Renewables

Big utilities enter market for small rooftop solar
Ray Henry and Susan Montoya Bryan, The Associated Press

Traditional power companies are getting into small-scale solar energy and competing for space on your rooftop. The emerging competition comes as utilities and smaller solar installers fight over the future of the U.S. energy system.

How investors plan to make money in renewable energy
Jonathan Vanian, Fortune

According to Kyung-Ah Park, a Goldman Sachs managing director and head of the environmental markets group, the renewable energy sector has "reached an inflection point" with more renewable energy systems installed this year than conventional systems. However, she said we might see "a pretty steep decline in 2017" in U.S.-based renewable energy investments if the tax credit doesn't get extended.

Hanergy boss blames short sellers
Lucy Honrby, Financial Times

Li Hejun, the Chinese solar energy entrepreneur, blamed short sellers for the "disaster" that has befallen his Hanergy Group in a rare speech months after shares in the Hong Kong-listed subsidiary plunged and were suspended.

Coal

Duke Energy Settles Groundwater Claims
The Associated Press

Duke Energy has reached a deal with North Carolina to pay $7 million to resolve claims related to alleged groundwater problems at its coal-ash facilities in the state. The state says the agreement announced Tuesday will also trigger accelerated remediation estimated to cost an additional $10 million to $15 million for Duke Energy.

Under Clean Power Plan, Pa. confronts its deep ties to coal
Elizabeth Harball, E&E

Pennsylvania's status as a nationwide energy giant is evident in the rural outskirts of this community in the state's southwest. Now that the Obama administration has released the final Clean Power Plan, aimed at reducing greenhouse gas emissions from power plants, Pennsylvania is taking a hard look at its relationship with the black rock.

Nuclear

NRC announces senior staff changes
World Nuclear News

From early November, Mike Weber, currently deputy executive director for Material, Waste, Research, State, Tribal and Compliance Programs, will become director of the Office of Nuclear Regulatory Research, while Jennifer Uhle, currently deputy director for engineering in the Office of Nuclear Reactor Regulation, will become director of the Office of New Reactors. Current director of Nuclear Materials Safety and Safeguards Catherine Haney will become Region II regional administrator in January, succeeding Victor McCree who has just assumed his position as Executive Director for Operations (EDO).

Climate

BHP insists global climate deal will not harm future mining profits
Fiona Harvey, The Guardian

BHP Billiton said on Tuesday that efforts to forge a new global agreement on climate change, at UN talks scheduled for Paris this December, would not harm its future profits, and anticipated continuing to mine for coal for decades to come. The company made profits of nearly $14bn in the year to 30 June, 2014, but profits tumbled to nearly $2bn this year on the back of declining demand for key commodities.

India and Brazil will not follow China's pledge to donate to poorer nations' climate efforts
Lisa Friedman, E&E

Neither India nor Brazil will unveil a major financial contribution toward poorer countries grappling with climate change as China did last week to the tune of $3.1 billion, ministers from both major economies said this weekend. In separate, exclusive interviews with *ClimateWire*, Indian Environment Minister Prakash Javadekar and Brazilian Environment Minister Izabella Teixeira praised the recent joint climate announcement between the United States and China.

Marco Rubio: I'm Not a Sinologist, Man
Jonathan Chait, New York Magazine

Marco Rubio has stopped framing his defense of unlimited carbon emissions as not being a scientist, man, and instead focused on the pointlessness of us doing anything since China would never, ever limit its own emissions. As he said in August, "as far as I can see, China and India and other developing countries are going to continue to burn anything they can get their hands on."

Getting to $100 Billion in Climate Change Aid
Eduardo Porter, The New York Times

Far from meeting a commitment of $100 billion a year by 2020 for developing nations, the richest countries have trouble defining what that would mean.

Opinions, Editorials & Perspectives

Big Solar's Dark Side
David Williams, Morning Consult

There are political charades by hired guns, billions of dollars in loan guarantees and taxpayer subsidies, and advocacy groups funded by Silicon Valley's mega rich engaging in guerilla-like campaign tactics. This might appear to be a movie or an episode of House of Cards, but this is reality and it's all in a day's work for the new Wall Street get-rich scam of rooftop solar leases.

Climate 'Reparations' for Poor Nations? Not So Fast
Cass R. Sunstein, Bloomberg View

There is unprecedented momentum for a real international agreement at the Paris climate talks in December. The biggest obstacle? Justice — or at least two ideas about justice. The first involves redistribution. Poor countries have a second and perhaps more compelling idea: corrective justice.

Biggest Mass Mobilization for Clean Energy Solutions in 2015: for Electric Vehicles
Gina Coplon-Newfield, Huffington Post

National Drive Electric Week was founded on the idea that nothing converts gasoline-car drivers to electric vehicle (EV) owners faster than conversations with existing EV owners and test-drives in these quiet, powerful and clean vehicles.

US Crude Oil Exports: Same Suit, Different Fabric?
Skip York, Forbes

Would a change in US policy really impact global oil markets? If the ban were dropped today, the answer would be hard to gauge.

Research Reports, Issue Briefs & Case Studies

The Impact of Three Tax-Reform Proposals on the Financial Performance of Energy Plants
Jason Burwen, American Energy Innovation Council

In recent years, several members of Congress have proposed comprehensive tax reforms: Representative David Camp in February 2014, Senator Max Baucusi in December 2013, and Senators Ron Wyden and Dan Coats in 2011. This study quantifies the impact of the Baucus, Camp, and Wyden-Coats proposals on the illustrative project economics of different electricity-generation sources.

Subject: Morning Consult Energy: House E&C Members Want Info from VW, EPA on Emissions Scandal; Chesapeake Energy Cuts 15% of Its Workforce

By Colleen Leahy

Today's Washington Brief

- Members of the House Energy and Commerce Committee wrote letters to Volkswagen and the Environmental Protection Agency requesting documents on the emissions scandal. The bipartisan group of lawmakers said it wants more information before holding a hearing on Volkswagen's alleged Clean Air Act violations. (The Hill)

- The EPA finalized a rule that will tighten emissions standards for oil refineries, placing stricter limits on carcinogenic chemicals such as benzene. The rule will be implemented in 2018. (Reuters)

- The EPA is preparing to finalize another emissions rule, this one for ozone, a pollutant that causes smog and is linked to asthma and other respiratory illnesses. The finalized rule is set to be released on Thursday. (The Associated Press)

Today's Business Brief

- Chesapeake Energy, the second-largest U.S. natural gas producer, will cut 15 percent of its workforce — 740 jobs — amid the downturn in oil prices. The company has already cut capital spending by about 40 percent this year. (Reuters)

- Utility Duke Energy will pay North Carolina $7 million to resolve claims of groundwater problems at the company's coal-ash sites in the state. The state said the agreement will also lead to an additional $10-$15 million for reparations from Duke. (The Wall Street Journal)

- The world's largest mining company, BHP Billiton, said it expects to continue mining coal for decades to come in spite of an anticipated international climate accord in Paris later this year, and that such an accord would not damage its profits. (The Guardian)

General

House committee wants more info from Volkswagen, EPA
Devin Henry, The Hill

Top Republicans and Democrats on the House Energy and Commerce Committee are asking federal regulators and Volkswagen officials for more information on the car manufacturer's alleged efforts to circumvent environmental rules. The group of lawmakers — Chairman Fred Upton (R-Mich.) and Reps. Frank Pallone (D-N.J.), Tim Murphy (R-Penn.) and Diana DeGette (D-Colo.) — sent VW and the Environmental Protection Agency (EPA) letters asking for documents and information related to the emissions scandal.

EPA prepares to tighten limits on smog-causing ozone as businesses gear up to fight the change
Matthew Daly, The Associated Press

The current federal limit on smog-forming pollution linked to asthma and respiratory illness "is not adequate to protect the public health," a top environmental regulator said Tuesday. Janet McCabe, acting assistant administrator of the Environmental Protection Agency, said a new, stricter standard is needed to cut dangerous ozone pollution and prevent thousands of asthma attacks, emergency room visits and even premature deaths.

EPA expects success from new methane rules
Devin Henry, The Hill

A top environmental regulator said Tuesday that he expects new federal standards for methane emissions will succeed in cutting down on the potent greenhouse gas. Joseph Goffman, the associate assistant administrator at the Environmental Protection Agency's (EPA) Office of Air and Regulation, said Tuesday that the agency's new methane standards, combined with expanded voluntary programs, will help the natural gas industry reduce its methane emissions.

In smog battle, industry gets help from unlikely source: black business group
Joby Warrick, The Washington Post

For years, the air over central Pittsburgh has ranked among the country's dirtiest, with haze and soot that regularly trigger spikes in asthma attacks, especially among the urban poor. So it might have seemed odd that a black business group would choose this spot to denounce proposed restrictions on smog.

Jeb Bush goes heavy on fossil fuels
Darren Goode, Politico

Jeb Bush released an energy plan Tuesday that was filled with Republican standards: Drill more oil, cut regulations and build the Keystone XL pipeline. But it's more notable for what it dodges: Bush is one of the greenest candidates in the Republican presidential field.

U.S. Futures Rally as S&P 500 Nears Its Worst Quarter Since 2011
Alex Longley, Bloomberg News

U.S. stock-index futures jumped, mirroring a rebound in equities around the world after a quarterly slump that wiped almost $11 trillion off the value of global shares. S&P 500 E-mini contracts expiring in December rose 1.3 percent to 1898 at 7:15 a.m. in New York.

Oil & Natural Gas

Oil down on large U.S. crude stockpile build
Karolin Schaps, Reuters

Oil prices slipped on Wednesday after an unexpectedly big build in U.S. crude inventories, further evidence of an oversupply that has helped halve global spot prices over the last year.

Chesapeake cuts 15 percent of workforce on oil slump
Anna Driver, Reuters

Chesapeake Energy Corp said on Tuesday it has cut about 15 percent of its workforce, or 740 jobs, as depressed oil and gas prices force deeper cost cutting at the U.S. No. 2 natural gas producer. The company, which now has about 4,000 workers, has already slashed capital spending this year by about 40 percent and cut operating costs as well as its dividend as crude prices that make drilling unprofitable linger for months.

U.S. rule to cut toxic emissions at refineries
Timothy Gardner, Reuters

U.S. oil refineries will face tighter standards in coming years on toxic emissions that cause lung problems and increase cancer risks, environmental regulators said on Tuesday. The Environmental Protection Agency finalized a rule, to be fully implemented in 2018, that aims to reduce emissions of benzene and other toxic emissions.

Judges rule NEPA study not needed for oil sands project
Robin Bravender, E&E

Federal judges denied environmentalists' challenge to a 600-mile pipeline carrying oil sands crude from Illinois to Oklahoma. Attorneys from the Sierra Club and National Wildlife Federation told the court that the government should have conducted more thorough environmental assessments of Enbridge Inc.'s Flanagan South pipeline, but the three-judge appeals panel rejected their argument.

Mexico Strains to Lure World's Oil Giants

Ex. 5

From Jeff:

What you're saying in this note seems to go beyond what Chris said in the call on Friday. I just want to make sure I'm getting it right.

Chris from the call:

We are “upping our game.” Today we are putting vehicle manufacturers on notice that our confirmatory testing is now going to include additional evaluations designed to look for potential defeat devices. We aren't going to tell them what these tests are, they don't need to know. They only need to know we will be keeping their vehicles longer and driving them more. We will be continuing to review with our partners at the California Air Resources Board what we can learn from this VW case and will adapt and improve as we always have to ensure we deliver on the Agency's mission.

So you're saying the agency is now testing EVERY light-duty diesel vehicle for defeat devices? This isn't just a few spot checks on cars borrowed from owners or taken off factory assembly lines? It is a systematic, on-the-road evaluation of every diesel car or light truck using portable emissions measuring equipment?

Also, is it a fair characterization to say the agency is open to additional changes to the testing program if warranted?

And isn't it true that road checks are costly? The ICCT says it spent $75,000 on its study that triggered the VW investigation, and that only covered three cars. Is there anything you can say about the cost, like the current EPA budget is sufficient to cover it, if that's accurate?

Second note from Jeff:

Laura: I'd also like to point out the other sections of the Sept. 28 story that discuss points made on the Friday call. If we're going to update or write a new story, I'd like to ensure that all of this is a fair characterization of what the agency is doing:

On Friday, the EPA announced it would look for more cars to borrow from vehicle

owners or rental-car companies for unspecified additional checking. The agency sent a letter to every company selling cars in the U.S., warning that this would add time to the process of verifying vehicles meet the requirements of the law.

Chris Grundler, director of EPA's Office of Transportation and Air Quality, wouldn't say what changes the agency will make to audit the lab results carmakers submit to regulators.

"They don't need to know," Grundler, speaking to reporters on a conference call Friday, said of the automakers. "They only need to know that we will be keeping their cars a little bit longer, and we're going to be driving them more."

He said no major overhaul of the way the agency conducts tests was warranted. "We are adapting and continuously improving them," he said.

"If EPA believes that vehicles are not compliant, we do not certify them and they cannot be sold," he said. "Ultimately it was this action that held Volkswagen to account."

Dynamometer testing is already supplemented by on-road testing using portable emissions equipment, lab testing of cars borrowed from consumers, audits of other industry emissions labs and examination of vehicles chosen randomly from assembly lines, said Valentine, the EPA spokeswoman.

The EPA already has on-road testing ability, Grundler said on Friday's call with reporters. The agency has used its resources in recent years to check carmaker gas mileage estimates and diesel trucks, two situations in which they had uncovered emissions cheating in the past.

Subject: PLEASE READ : ECM Software for my 2012 Jetta TDI ---> the plot thickens ?

DEAR United States Environmental Protection Agency,

Volkswagen applied a software update to my 2012 Jetta TDI on **7/16/2015** as part of a routing "software update" – when I went in for an oil change. I did not approve this software being applied. I was told that it had been performed, after my oil had been changed and an inlay TSB had also been performed.

I did notice a decrease in overall MPG on my car, after this software update.

In the attached notice(see below) from Volkswagen, it states that this software update was done in cooperation with **The United States EPA**.

Please note that my software update was done, prior to the public announcement about the VW TDI Emissions scandal.

When I called Volkswagen USA – a few days ago, asking them for answers about my software "upgrade" – they advised me that they could take my name and number, but I must understand, that they will not be able to answer my question.

They advised that they would have to wait for the entire VW Diesel Recall to unravel, and that they still could not answer my question about the software update: 230601A that was performed.

Can you please answer the following questions:

1. What was the purpose of this Software Update?

2. VW Claimed that they were working with the United States EPA on this "emissions service action". What was the purpose of applying this software update? Hopefully, the EPA can provide an answer, as VW USA has declined to answer me. Why would VW start applying "software Updates" to their TDI vehicles, prior to any final solution for the VW TDI Emissions deception?

3. I feel that the VW notice below, is more of a scare tactic (about someone's MIL being staying on) --- while failing to be at all truthful, about what is actually being done to someone's VW TDI Vehicle.

Thank you in advance for your help in this matter.

Warmest Regards,

Subject: **Emissions Service Action 23O6 – ECM Software**
Certain 2010-2014 Model Year Volkswagen Vehicles Equipped with a 2.0L TDI® Clean Diesel Engine

Dear Volkswagen Owner,

As part of Volkswagen's ongoing commitment to our environment, and in cooperation with the United States Environmental Protection Agency, we are informing you of our decision to conduct an emissions service action on certain 2010-2014 model year Volkswagen vehicles equipped with a 2.0L TDI® Clean Diesel engine. Our records show that you are the owner of a vehicle affected by this action.

What is the issue, and what will we do?

The vehicle's engine management software has been improved to assure your vehicle's tailpipe emissions are optimized and operating efficiently. Under certain operating conditions, the earlier strategy may have increased the chance of the vehicle's MIL light illuminating. If the MIL illuminates for any reason, your vehicle will not pass an IM emissions inspection in some regions.

To address this issue, your authorized Volkswagen dealer will update the ECM software in your vehicle. This work will take about one hour to complete and will be performed for you free of charge. Please keep in mind that your dealer may need additional time for the preparation of the repair, as well as to accommodate their daily workshop schedule.

IMPORTANT!

Please note that if the ECM in your vehicle has been "chipped," "tuned," or otherwise modified from original factory specifications with aftermarket components and/or software, work needed to repair, replace, or return the ECM to original factory specifications is NOT covered under this action.

What should you do?

In order to limit any possible inconvenience, please contact your authorized Volkswagen dealer as soon as possible to schedule this service.

VW FOIA, EPA 06/20/2017 2017-FFP_027938

ENERGY POLICY:

House GOP revises omnibus bill; committee votes tomorrow

Hannah Northey, Geof Koss and Katherine Ling, E&E reporters

Published: Tuesday, September 29, 2015

This story was updated at 1:55 p.m.

Republicans on the House Energy and Commerce Committee today unveiled a revised version of a comprehensive energy package that's up for a vote in the lower chamber tomorrow after weeks of trying to reach a compromise with Democrats.

The 208-page manager's amendment to H.R. 8, the "North American Energy Security and Infrastructure Act of 2015," contains provisions included in an earlier draft that would speed natural gas exports and efficiency, as well as new language aimed at bolstering hydropower and requiring reviews of how the Clean Power Plan would affect the grid.

Committee Chairman Fred Upton (R-Mich.) said the amendment reflects input from several witnesses, including Energy Secretary Ernest Moniz and the private sector.

A Republican aide said the amendment was written by the majority but merits bipartisan support.

"Keeping the lights on and engines running across America should remain a top priority -- we have crafted a thoughtful, substantive package to update our laws for the 21st century that will hopefully end up on the president's desk for his signature," Upton said in a statement.

The language arrives after weeks of debates over a host of policy issues that derailed an earlier markup of the bill. Republicans have said they will follow regular order and take amendments in marking up the legislation starting tonight, but just how much bipartisan agreement can be reached is unclear. A spokeswoman for Energy and Commerce Democrats did not respond to a request for comment today on whether the minority supports the manager's amendment.

Rep. Frank Pallone of New Jersey, the full committee's top Democrat, accused Republicans of abandoning nearly months of "good faith efforts" to reach an agreement on both sides of the aisle and making drastic changes to the energy bill.

Pallone also said he cannot support the bill in its current form.

"With this manager's amendment, the majority has made significant and controversial changes, just hours before we are set to start marking up this bill," Pallone said in a statement. "A number of concerning provisions have been added at the last minute, and this bill continues to ignore the impacts of climate change, which remain the biggest threat to our energy security."

Strategic Petroleum Reserve facilities

The package includes language to establish a budget-neutral fund for building, maintaining, repairing and replacing Strategic Petroleum Reserve facilities. It would also set up a competitive grant program for states, local governments and Indian tribes to enhance grid reliability. Under the bill, the Energy secretary would be authorized to sell crude from the SPR to reinvest in energy security projects.

Energy and Power Subcommittee Chairman Ed Whitfield (R-Ky.) said during an interview earlier this month -- after the full committee punted on marking up the bill -- that Republicans had included the SPR provision to appease their Democratic colleagues while receiving little in return (*Greenwire*, Sept. 17).

Clean Power Plan

Yet another section of the bill appears to take aim at U.S. EPA's Clean Power Plan and other major utility-

sector rules by requiring the Federal Energy Regulatory Commission and the country's grid operators to analyze the effects of complying with any proposed or final "billion-dollar" federal rule that affects electric generating units. Those rules would include environmental rules like the Clean Power Plan, which has become a target for Republicans.

Under the bill, FERC and system operators would need to complete an independent review of how a rule would affect reliability, the nation's energy mix, wholesale markets, and infrastructure like transmission and gas pipelines.

LNG

The revised bill also revives a provision that would require the Energy Department to make final decisions on liquefied natural gas exports within 30 days of the conclusion of National Environmental Policy Act review requirements. That requirement was included in an earlier draft of the bill but was dropped before the measure moved through subcommittee in July (*Greenwire*, July 22).

The energy package that passed the Senate Energy and Natural Resources Committee in July contains similar language.

Building efficiency

The manager's package would repeal part of a 2007 law that required the phaseout of fossil-fuel-generated power in new and significantly renovated federal buildings by 2030. The American Gas Association today said the repeal is accompanied by a compromise negotiated by Sens. John Hoeven (R-N.D.) and Joe Manchin (D-W.Va.) that would beef up existing federal building targets.

Additionally, the revised measure includes language from a controversial bill, H.R. 1273, sponsored by Reps. Marsha Blackburn (R-Tenn.) and Kurt Schrader (D-Ore.), that would impose procedural requirements on DOE for setting building efficiency codes.

An earlier version of that provision was a sticking point for efficiency advocates, who said it would unnecessarily tie DOE's hands in setting building codes. It's unclear whether those earlier concerns have been addressed.

Other efficiency standards

The changes revise and clarify DOE's process for setting energy efficiency standards to allow industry more time for review and input about the data and models the agency bases its decisions on. Under the revised bill, DOE would have to finalize what it will test to ensure new appliances meet the standards -- known as test procedures -- at least 180 days before the end of the public comment period for a proposed rule. The agency would also have to start a rulemaking procedure under the new provisions to ensure accessibility and public availability of its technical and economic assumptions, methods and models used to justify a standard.

Under the Obama administration, DOE has picked up the pace on updating and reviewing energy efficiency standards, some of which were years past the statutory deadline and were the subject of several lawsuits from efficiency advocates and states.

But industry has complained that DOE's accelerated schedule has led to test procedures and rules being finalized in parallel, uncalculated cumulative regulatory impact, and a lack of time to gather sufficient information and feedback from stakeholders -- as exemplified by a recent backlash against a water heater and gas furnace standard (*Greenwire*, July 14).

The new language also offers more flexibility for DOE to adopt recommendations from consensus agreements developed by working groups of industry, advocates and other stakeholders. And it would repeal several studies including on residential energy efficiency, weatherization and energy saving potential.

Hydropower

Unlike an earlier version, the revised language includes provisions to bolster hydropower. It would amend a 2005 law to reauthorize incentives and incentive payments to owners and operators of hydroelectric facilities on existing dams through fiscal 2025.

The language appears to address a sticking point that triggered partisan grumblings in the past by minimizing the amount FERC infringes on property owners and users when issuing hydropower licenses. Rep. Jerry McNerney (D-Calif.) during an interview before the August recess said that he was working with his Republican colleagues on the hydropower provision and that the agency's role was playing into the disagreement.

"I don't think FERC is intentionally lobbying for that; I think what the Republicans want is to have one agency so they can have everyone be responsible to that agency and they can get it done," McNerney said at the time. "I think that's the big point of contention -- it's giving too much authority, decisionmaking authority, to one agency."

Carbon capture

Another change is the inclusion of provisions meant to boost fossil fuel research and development, particularly carbon capture, utilization and sequestration (CCUS) efforts to help coal plants burn cleaner.

Originally, House Republicans opted to leave carbon capture out of their broad energy package, focusing instead on helping coal through efforts to roll back Obama administration rules, including a requirement for new coal plants to include carbon capture.

The new language includes an effort to promote large-scale demonstration and commercialization of CCUS. It would also task DOE with evaluating government-backed CCUS projects every two years for accountability.

This week, DOE announced it was returning almost $2.5 billion to the Treasury in unspent research and development dollars from the 2009 stimulus bill, including $1.27 billion from CCUS technology.

Projects like Summit Power Group LLC's Texas Clean Energy Project and Hydrogen Energy California LLC's carbon capture venture were not able to spend all the money allotted by the end of the fiscal year deadline (*ClimateWire*, Sept. 23; *Greenwire*, July 10).

In the Senate, both Republican and Democratic versions of broad energy reform legislation include CCUS provisions. Pro-coal lawmakers prefer language championed by Energy and Natural Resources Chairwoman Lisa Murkowski (R-Alaska).

Reporter Manuel Quiñones contributed.

AIR POLLUTION:

Obama admin cracks down on refinery emissions

Amanda Reilly, E&E reporter

Published: Tuesday, September 29, 2015

Petroleum refineries will be forced to curb toxic air emissions and beef up monitoring under a rule finalized today by U.S. EPA.

Released this afternoon ahead of a court-ordered deadline tomorrow, the rule encompasses New Source Performance Standards and maximum achievable control technology for refineries under the Clean Air Act.

"The common-sense final rule will improve air quality and protect the health of families who live near refineries," EPA said.

There are 142 petroleum refineries considered major pollution sources under the Clean Air Act, as well as seven small area sources.

Among contaminants targeted by the rule: benzene, polycyclic aromatic hydrocarbons, nickel and hydrogen cyanide. EPA said the final rule would reduce emissions of toxic air pollutants by 5,200 tons per year, as well as eliminate 50,000 tons of volatile organic compounds annually.

First proposed in May 2014, the rule requires refineries to upgrade emissions controls and to continuously monitor concentrations of benzene pollution levels at their property lines.

Refiners will be required to encircle their facilities with monitors so that they can detect pollution depending on the wind, install technology that can detect benzene at very low levels and take corrective actions if monitored emissions exceed limits.

"This rule will, for the first time ever, provide important information about refinery emissions to the public and neighboring communities by requiring refineries to monitor emissions at their fence lines," EPA said in a statement sent to environmental justice advocates.

The rule will also put in place a national program to reduce smoking flare emissions and emissions by pressure-release devices. Refineries will be required to monitor flares. The rule will limit flaring events to no more than three events in three years per device, EPA said in its fact sheet.

Storage tanks and delayed coking units also face new emission limitations under the final rule.

The oil industry had opposed the refinery regulation's fence-line monitoring and flaring requirements, warning that the agency's proposal overall would cost refiners more than $20 billion on top of millions of dollars in annual costs.

To address concerns raised by the oil industry about real-time monitoring, EPA's final rule allows refiners to choose alternative methods in the short term that will allow for real-time monitoring in the future.

EPA said the final rule will cost $283 million in capital costs and $63 million annually.

The White House Office of Management and Budget hosted a handful of meetings on the final rule this month, including with key oil industry groups, but the release of the standards has been overshadowed by EPA's more contentious proposal to lower the national ozone standard. The final ozone rule is due out this week under a court order (*see related stories*).

AIR POLLUTION:

Asthma sufferers plead for tight ozone curbs in OMB meetings

Amanda Reilly, E&E reporter

Published: Tuesday, September 29, 2015

Because her two children have asthma, Julie Franks must monitor daily air quality indexes, keeping medicine at hand and administer allergy shots every week.

The Valencia, Pa., resident shared her story last week with White House officials during a meeting organized by the American Lung Association as part of the group's push for a tighter U.S. EPA pollution standard for ground-level ozone.

"There are just way too many kids being born with asthma and developing asthma," she told *Greenwire* in a follow-up interview. Her youngest son was born with asthma, while her oldest son developed the condition after he was born.

Franks is part of a broader strategy that the American Lung Association (ALA) has embarked upon as EPA nears the Oct. 1 deadline for releasing a revised ozone standard. Over the month of September, ALA and its allies have organized five meetings with the White House Office of Management and Budget in which residents of local areas and doctors have shared direct experiences with asthma and air pollution.

The 30-minute meetings have featured residents of Colorado, Illinois, Michigan, Pennsylvania and Virginia.

"It's very helpful for people to share these stories because it stays with you," said Janice Nolen, assistant vice president for national policy at the ALA.

EPA has proposed tightening the national ambient air quality standard for ozone from 75 parts per billion -- set in 2008 during the George W. Bush administration -- to between 65 and 70 ppb. Ozone is a key component of smoggy air, and EPA said it determined through a scientific review that the 75 ppb limit was no longer adequate to protect public health.

The Obama administration faces intense pressure from industry to retain the existing standard, while public health and environmentalists have called on EPA to set a new standard no higher than 60 ppb.

OMB yesterday wrapped up meetings on the ozone standard. According to a schedule posted online, White House officials held 19 meetings with stakeholders.

The ALA has been among the groups most aggressively pushing for a 60 ppb limit. Earlier this year, it launched a campaign meant to highlight ozone pollution's effect on children and their ability to play outside. Studies have found that exposure to ozone can cause asthma attacks and reduced lung function, though industry disputes some of the findings (*Greenwire*, Aug. 6).

According to ALA representatives in Washington, D.C., between four and seven people with breathing problems and physicians have called in to each OMB meeting.

Franks called in with her story last Thursday. Her eldest son, Tyler, 17, developed asthma after he was barely a year old, while her younger son, Jesse, 12, was born with the condition.

Franks, a truck driver from western Pennsylvania's Butler County, said asthma and the threat of attacks have limited her sons' ability to play sports and be outside, particularly for her younger son. At certain times of the year, Jesse takes four different kinds of medication. He is allergic to "everything but a maple tree" and needs allergy shots every week, Franks said.

Franks said her life revolves around paying attention to air quality readings and that ground-level ozone pollution is a major concern.

"We can't see it. It's like there's poison out there. It's invisible, and you can't see it," Franks said. "Even on the best day, and you go out, the sun is shining and there's nice, crisp air -- it's not as good as you think it is."

She said she urged OMB to lower the ozone standard to 60 ppb, arguing that there is a "big difference" in lives saved between a 70 ppb standard and the more protective limit.

Along with Franks, four doctors and one other Pennsylvanian who suffers from asthma spoke at the Sept. 24 meeting.

The ALA has previously released polling showing that the majority of the American public are in support of a tighter ozone standard, despite the potential compliance costs for industry. Lyndsay Moseley, director of the group's Healthy Air Campaign, said that the participation in the OMB meetings showed that people are engaged in the issue.

"There's been a real appetite for people outside the Beltway to tell their stories," she said.

CAMPAIGN 2016:

Jeb Bush to back oil exports in energy plan

Jennifer Yachnin, E&E reporter

Published: Tuesday, September 29, 2015

Former Florida Gov. Jeb Bush today will call for ending the ban on U.S. oil exports as well as easing restrictions on natural gas exports when he unveils his energy policy proposals at an event near Pittsburgh.

Bush, who is vying for the GOP presidential primary nod, is set to speak at Canonsburg, Pa.-based Rice Energy Inc. this afternoon and will publish an essay on the website Medium about his plans.

"Lifting the ban on crude oil exports and liberalizing natural gas exports would create hundreds of thousands of additional jobs and significantly lower net energy costs," Bush wrote in a preview of his plan provided to the Associated Press.

In addition to backing export measures, Bush will reiterate his support for constructing the Keystone XL pipeline and his opposition to a series of Obama administration environmental regulations.

Bush last week announced a series of regulatory reforms he would back if elected to the White House, including the rejection of the Clean Power Plan, which aims to reduce greenhouse gas emissions from existing power plants; the coal ash rule, which addresses the disposal of coal combustion waste; and the Waters of the U.S. rule, which aimed to clarify which waters fall under the protection of the Clean Water

Act (*E&ENews PM*, Sept. 22).

Bush also is expected to repeat his vow to focus on increasing domestic energy production in his efforts to expand the economy if elected to the White House (*Greenwire*, April 8).

"More domestic energy leads to more jobs, higher wages, lower gas prices and smaller electricity bills," Bush said in the preview. "In short, it means more money in people's pockets, allowing them more freedom to make more choices for themselves and their children."

APPROPRIATIONS:

House to vote on CR tomorrow

Daniel Bush, E&E reporter

Published: Tuesday, September 29, 2015

The House will vote on a stopgap spending bill tomorrow to keep the government funded through mid-December, a top Democrat said today.

Minority Whip Steny Hoyer (D-Md.) said the House will move forward tomorrow on a Senate-backed spending bill, known as a continuing resolution, or CR. The Senate is voting today on the legislation, which Congress must pass before midnight tomorrow to avoid a government shutdown.

"I expect [the bill] will be brought to the floor tomorrow, and I expect it will pass," Hoyer told reporters.

House Republican leaders also signaled that the vote would likely happen tomorrow, despite continued opposition from conservative GOP members who want a spending bill that doesn't include funding for Planned Parenthood.

But Hoyer said there's growing support for the "clean" CR moving through both chambers. "We need to keep the government open, and I think we're going to do that," Hoyer said.

TRANSPORTATION:

McCarthy vows to fund highways, revamp federal agencies

Sean Reilly and Kevin Bogardus, E&E reporters

Published: Tuesday, September 29, 2015

House Majority Leader Kevin McCarthy (R-Calif.), likely soon to become House speaker, today predicted that the chamber will quickly pull off a feat that has eluded it for years: passage of long-term surface transportation funding legislation.

With the help of money generated from tax code changes, "we're going to find a bill done next month that is a six-year highway bill," McCarthy said today on the MSNBC talk show "Morning Joe."

McCarthy, the favorite to succeed outgoing Speaker John Boehner (R-Ohio), cited passage of a long-term bill as one of two policy priorities he intends to pursue if elected to the post, the other being a significant refiguring of federal agencies.

After the collapse of the Soviet Union, the U.S. government used independent military base-closing commissions to help reduce the cost and sprawl of the defense budget. McCarthy said something similar should be tried with agencies, which frequently overlap each other.

"We're going to make sure we transform these agencies because these agencies that we have today, we've never crafted them in the same manner," McCarthy said. "Look at the flow chart, look at the duplication. Why don't we go through and revamp the entire process so they work?"

But transportation is the issue that more immediately piques lawmakers' interest.

Like Boehner, McCarthy ruled out an increase in the 18.4-cent-per-gallon federal gas tax but alluded to efforts by House Ways and Means Chairman Paul Ryan (R-Wis.) to produce more transportation revenue by changing the tax treatment of U.S. multinationals' earnings held overseas. Ryan has yet to spell out a plan, however, by which such changes could generate the approximately $100 billion in new revenue that, according to the Congressional Budget Office, will be needed to stabilize road and transit funding over the next six years.

Congress last approved a six-year surface transportation bill in 1998, followed by a four-year measure in 2005 and -- after a series of short-term extensions -- an approximately two-year bill in 2012.

Since July 2014, lawmakers have passed three stopgap extensions, the latest of which expires at the end of next month.

The recurring roadblock to a new long-term measure has been financing. Federal gas and diesel taxes no longer bring in enough money to keep up with congressionally imposed spending demands. As a result, lawmakers have had to repeatedly tap general Treasury revenue. Under budget-scoring rules, those bailouts have to be offset by savings or revenue from other sources.

Finding those offsets has been a struggle, likened by some observers to scratching for change in the couch cushions. A road, rail and transit authorization bill approved by the Senate in July, for example, would on paper run for six years but contains funding for three.

The House Transportation and Infrastructure Committee, which had been expected to mark up its version of a long-term bill earlier this month, has yet to proceed because members are waiting to hear from Ryan how much money will be available, the panel's top Democrat, Rep. Peter DeFazio of Oregon, said in a recent interview.

COAL:

Dems introduce bill to help miners with black lung

Manuel Quiñones, E&E reporter

Published: Tuesday, September 29, 2015

This story was updated at 1:25 p.m.

Democratic lawmakers in both the House and Senate announced legislation this morning meant to help mine workers obtain black lung disease benefits.

The legislation stems from investigations by the Center for Public Integrity and ABC News, which accused

government bureaucracy and coal industry resistance for miners not obtaining benefits.

The new bill, similar to measures introduced last year, would increase miners' access to their medical information and includes allowing them to review and challenge coal company medical information.

"There is undeniable evidence that, as thousands of miners are being affected by black lung, coal company lawyers are determined to exploit loopholes preventing miners and their families from receiving the benefits they deserve," said House sponsor Rep. Matt Cartwright (D-Pa.).

Senate sponsor Sen. Bob Casey (D-Pa.) added, "We know the black lung claims process is badly broken and in need of reform to target unethical legal and medical practices and to give miners a fair shot at justice."

Co-sponsors on the bill include Rep. Bobby Scott of Virginia, top Democrat on the Education and Workforce Committee, and Democratic Sens. Joe Manchin of West Virginia, Tim Kaine of Virginia and Sherrod Brown of Ohio.

The Department of Labor has announced several reforms to address black lung benefit issues, but lawmakers say legislation is necessary.

Just this morning, the Office of Workers' Compensation Programs and the National Institute for Occupational Safety and Health announced a memorandum of understanding on a quality assurance program for X-rays tied to determining black lung benefits.

The National Mining Association and other skeptics of administration actions regarding black lung benefits say scrutiny is also needed to make sure help goes to truly deserving miners (*E&ENews PM*, April 30).

NMA spokesman Luke Popovich called the bill a solution in search of a problem. He said a provision tucked into the Affordable Care Act makes it easier for claimants to obtain black lung disease benefits.

"The provision specifically returns the program to its 1980s condition awarding claimants compensation based on medical determinations that have no relation to occupational exposure to coal dust," he said. "Survivors are therefore awarded benefits irrespective of the cause of the miner's death. This legislation will likely ensure a continuation of this practice."

NMA has also vigorously opposed a new rule by the Mine Safety and Health Administration to reduce the amount of coal dust particles that miners can be exposed to.

AIR POLLUTION:

Greens ready to litigate as EPA preps ozone standard

Amanda Reilly, E&E reporter

Published: Tuesday, September 29, 2015

Environmentalists are threatening legal action if U.S. EPA fails to finalize a new ozone standard that they believe protects public health.

EPA is said to be ready this week to finalize a standard of 70 parts per billion -- a number that greens find lacking.

"The 70-part-per-billion option would be just blatantly unlawful," said David Baron, managing attorney at Earthjustice.

Ground-level ozone is a key ingredient in smog, which forms when nitrogen oxides and volatile organic compounds react in sunlight. Ozone gas been linked to negative health effects such as exacerbation of asthma and reduced lung function.

Under the Clean Air Act, EPA must set pollution standards that provide an ample safety margin for protecting public health.

The current standard, 75 ppb, was set by the George W. Bush administration in 2008. In its proposal to lower the limit last November, EPA said it determined through a review of public health science that the 75 ppb level no longer met the requirement of the law. It proposed to tighten the standard to within a range of 65 to 70 ppb.

EPA faces a court-ordered deadline of Oct. 1 to pick a final limit. Sources say the agency will pick 70 ppb.

In a call with reporters yesterday, environmental groups argued there was consensus in the medical community that a 70 ppb limit wouldn't protect the public, particularly children and the elderly, from the adverse health effects.

"It is not defensible or responsible to set the standard at 70," said John Walke, a senior attorney and air specialist at the Natural Resources Defense Council.

The American Lung Association, American Thoracic Society and American Academy of Pediatrics have called on the Obama administration to set a new standard no higher than 60 ppb (*see related story*).

Last year, EPA's own scientific advisers said a new limit of 70 ppb would likely not pass the ample-margin-of-safety test of the Clean Air Act and recommended that EPA choose a limit more toward the 60-to-65-ppb range.

"We deserve better, frankly, than 70 parts per billion, which is the weakest and the least health protective option that's under consideration," said Mary Anne Hitt, director of the Sierra Club's Beyond Coal campaign. "This is not just a number on a page. It's someone's child being rushed to the hospital, it's the death of a loved one and it's basic fairness."

The groups also expressed concerns that a 70 ppb limit would give the public a false sense of security because it is tied to EPA's Air Quality Index, a system that alerts the public when air quality has fallen below the national standard.

"We sued the Bush administration for adopting a 75-parts-per-billion standard," Earthjustice's Baron said, "and I think there's a good likelihood that we would sue if the Obama administration adopted a 70-parts-per-billion standard."

Business and industry groups have waged an aggressive campaign against a new standard on Capitol Hill, in the administration and over the airwaves. Led by the National Association of Manufacturers, they have argued that a new standard would impose crippling economic costs and halt expansion of businesses across the country.

Although environmentalists will likely view a 70 ppb limit as a concession to industry, a NAM representative said last week that his group would also not be satisfied unless EPA retains the existing limit of 75 ppb.

"Our view is that the only appropriate outcome is for EPA to allow manufacturers and states to comply with the existing 2008 standards," said Greg Bertelsen, the trade group's director of energy and resources policy.

Baron hinted that environmental groups would likely intervene on behalf of EPA in an industry challenge to the standard while at the same time pushing the court for a lower limit.

Compounding environmentalists' concerns about the administration bowing to industry pressure is the Obama administration's decision in 2011 to punt on a new ozone standard as elections loomed.

NRDC's Walke called that choice the "worst environmental decision" of President Obama's first term and characterized this week's decision as a way of making things right with environmental groups.

"The question remains," he said, "whether the smog health standard will remain unprotective when the Obama administration leaves office."

AIR POLLUTION:

Glass company to spend $70M on upgrades under EPA settlement

Sam Pearson, E&E reporter

Published: Tuesday, September 29, 2015

A Michigan-based glass manufacturer will pay $70 million to upgrade pollution controls at plants in seven states to resolve alleged Clean Air Act violations, U.S. EPA said today.

The settlement calls for Guardian Industries Corp. to install new equipment to control nitrogen oxide, sulfur dioxide, particulate matter and sulfuric acid mist at flat-glass manufacturing plants in California, Iowa, Michigan, New York, Pennsylvania, South Carolina and Texas.

Guardian will also fund a $150,000 environmental mitigation project in California's San Joaquin Valley and pay a $312,000 civil penalty.

EPA had accused Guardian Industries of violating the Clean Air Act and state emission control plans when it modified flat-glass furnaces at sites in Kingsburg, Calif.; DeWitt, Iowa; Carleton, Mich.; Geneva, N.Y.; Floreffe, Pa.; Richburg, S.C.; and Corsicana, Texas, in a way that increased emissions.

The agreement is EPA's first Clean Air Act enforcement settlement involving the flat- or float-glass manufacturing sector, which produces glass used for office building windows, homes and vehicle windshields.

"Air pollution from flat glass facilities can impact communities hundreds of miles away, which is why today's announcement is so crucial to address pollution at the source and protect public health," said Cynthia Giles, EPA's assistant administrator for enforcement and compliance assurance.

"By investing in pollution control equipment and funding a mitigation project that will protect the health of low-income residents, Guardian is setting an example for the flat glass industry for how to control harmful air emissions at its facilities."

Of the civil penalty, Iowa and New York will each receive $78,000 for their participation in the settlement, with the rest going to the federal government. The San Joaquin Valley Air Pollution Control District also

played a role but won't receive a cut of the penalty, EPA said.

The agreement "is a great example of a cooperative, companywide effort to reduce air pollution and will mean cleaner air for communities across the country, where glass manufacturing is currently a significant source of the air pollutants that cause serious lung and heart problems," said John Cruden, the assistant attorney general for the Justice Department's Environment and Natural Resources Division.

The settlement, which is expected to be lodged at the U.S. District Court for the Eastern District of Michigan, will be subject to a 30-day comment period. A spokeswoman for Guardian Glass wasn't immediately available for comment.

BIOFUELS:

Jury mulls fate of fake pastor accused of bilking investors

Published: Tuesday, September 29, 2015

A Portland, Ore., man is on trial in U.S. District Court for his part in a scheme to pose as a devout Christian in order to attract investors into a bogus business to turn jatropha trees in Ghana and Chile into low-cost biodiesel.

Prosecutors say Jack Holden and his partner, Lloyd Sharp, pretended to be former missionaries and pastors while seeking out Christian men's groups in the Portland area in 2007, telling their marks that a $350,000 investment would make them millions.

Assistant U.S. Attorney Donna Maddux told the jury that Sharp and Holden took in $1.3 million without ever creating or selling the biofuel.

"Holden claimed, among other things, that he had 5 million acres of land in Ghana that was under contract with local tribes to grow jatropha trees," according to a brief filed by the government. "Holden falsely told the investors that he would use their investment funds to buy a prefabricated refinery that would be shipped to and set up in Ghana, and that the plant would start producing biodiesel immediately."

Sharp, who used the name Kevin Thomas during the scheme, is already serving five years in prison for fraud and conspiracy charges. He has agreed to pay $6 million in restitution.

Holden's attorney, Lisa Hay, said her client did not intend to cheat investors but that his prospects fell through.

"Was the dream too big? Maybe. But it was a real dream, and it was a real company," she said in her opening statement (Bryan Denson, Portland *Oregonian*, Sept. 28). **-- AW**

OIL AND GAS:

EPA evaluating scope of proposed methane rules

Jean Chemnick, E&E reporter

Published: Tuesday, September 29, 2015

It will become clear in the next few years whether U.S. EPA's proposed methane rules should be

extended to include existing oil and natural gas operations, the Office of Air and Radiation's top lawyer said today.

Joe Goffman said on the sidelines of an event today at the Newseum that the agency moved forward with its draft rules for methane and volatile organic compounds (VOC) in August because "those were what we were ready to do."

But the agency continues to update and refine its data about the petroleum sector's methane leakage, he noted. And new data are always becoming available about the industry's progress in curbing its own emissions -- including through participation in voluntary EPA reduction programs. Meanwhile EPA has proposed expanding its VOC rules to cover existing oil and gas operations in ozone nonattainment areas, and states like Colorado are phasing in methane curbs of their own.

So a future EPA may find it unnecessary to regulate methane directly from existing sources, Goffman said.

"There will be a record a couple of years from now that I anticipate will be compelling in one direction or the other," he said. "If we were having this conversation six months from now, we would be better informed than we are now. And so the answer may be different."

Existing sources are not expected to come under regulation during Obama's administration, though the rule for new sources will be final next spring or summer. And Goffman acknowledged that the Clean Air Act does not require EPA to promulgate a rule for existing sources within a set period of time after the new source rule takes effect -- a fact that could give subsequent administrations an easy out if they don't share the current administration's climate goals.

But Goffman said at the event in Washington, D.C., hosted by *The Hill* newspaper that Obama's Climate Action Plan in itself will "lay the groundwork for our successors whether it's in this decade or the decades after to continue to take on the challenge of climate change."

The Obama administration has set a goal of reducing overall methane between 40 and 45 percent by 2025 compared with 2012 levels.

EPA is taking comment now on its August draft, including on whether it should require controls for liquids unloading, which clears gas wells of accumulated liquid to increase production. Goffman said the equipment was not covered by the draft because of a lack of data, but "we will be going back for more information."

EPA's new proposal does require both oil and gas well operators to perform green completions to contain emissions, and it addresses leaks from pneumatic pumps, compressors and other equipment in the oil and gas system (*Greenwire*, Aug. 18).

The public comment period began Sept. 18 and closes in December.

The methane draft has attracted relatively little attention from congressional Republicans, especially when compared with the maelstrom surrounding EPA's Clean Power Plan. There have been no committee hearings on the rule to date. And while the American Petroleum Institute and other trade groups pushed back against the proposal -- arguing that it is unnecessary given industry's progress and on shaky legal footing -- companies themselves have been relatively quiet.

Goffman said the muted response could be due to ongoing EPA outreach.

"I think the extent to which we've had a constructive working relationship with the industry itself has

contributed to the current atmosphere that we're doing these proposals in," he said.

Speaking later in the morning at *The Hill* event, Mark Boling, general counsel and secretary of Southwestern Energy, said the administration's overall methane reduction target would be achievable if producers participate in voluntary reduction programs.

ELECTRIC VEHICLES:

Governments join forces to promote zero-emission cars

Sean Reilly, E&E reporter

Published: Tuesday, September 29, 2015

Almost a dozen national and state governments formally joined forces today to promote the global adoption of electric cars and zero-emission vehicles, or ZEVs, as a potentially powerful brake on climate change.

The founding members of the International ZEV Alliance -- which currently account for more than one-third of worldwide electric vehicle sales -- include the Netherlands, the United Kingdom and the Canadian province of Quebec, along with California and a half-dozen other state governments in the United States that formed a similar consortium two years ago.

The international alliance's goals include setting "ambitious targets" for expanding ZEV use, sharing data and helpful practices, and encouraging other governments to sign on to the effort, according to a news release issued after a New York City signing ceremony.

"We strongly believe that international cooperation is the key to grow the market both in the Netherlands as well as globally," Peter van Deventer, diplomatic liaison at the Dutch consulate general in New York, said in an email before the event. Innovation and investment in ZEVs will have a "much better chance if we cooperate and coordinate," he said.

In California, upwards of 40 percent of greenhouse gas emissions come from the transportation sector, said Matt Rodriquez, the state's secretary for environmental protection, during a phone interview.

"Long-term, we want to see these vehicles adopted," Rodriquez said. But that requires government action to assure the auto industry that the needed infrastructure will be available, he said, along with incentives to offset the stiff price tag of electric vehicles in comparison with gasoline-powered models.

Although the number of plug-in electric vehicles on the roads worldwide is estimated to have hit the 1 million mark this month, the market is still in its "nascent stage," said the International Council on Clean Transportation, a nonprofit group that is providing administrative help to the alliance, in a report also released today.

The approximately 300,000 electric vehicles sold last year amounted to fewer than 0.5 percent of global passenger car sales. But the overall market is growing, and "policy leadership" in places like Norway, the Netherlands and California has helped increase EV adoption at a much higher rate, the report said. Practices that appear to help include offering rebates and other financial incentives worth more than 15 percent of the car's sticker price, working with electric utilities to set lower rates for vehicle charging, and expanding the public and workplace charging network, according to the report.

"This is a decades-long process to transition to completely new technology," said Nic Lutsey, the study's

author and program director at the clean transportation council.

For Quebec, which already gets most of its electricity from hydropower and is home to more plug-in vehicles than any other Canadian province, there's an economic incentive as well. The spread of "green" technology "will create an economic boom of immense dimensions," said Jean-Claude Lauzon, delegate general to New York. "We want to take full advantage of that."

Other founding members of the alliance are Norway and the states of Connecticut, Maryland, Massachusetts, Oregon, Rhode Island and Vermont.

DEFENSE:

Energy leaders say budget caps hurt efficiency, security

Ariel Wittenberg, E&E reporter

Published: Tuesday, September 29, 2015

The Pentagon's top energy officials yesterday blasted congressional budget caps, saying they inhibit the military's ability to invest in energy efficiency and energy security initiatives.

"There is no money," said acting Assistant Secretary of Defense for Energy, Installations and Environment John Conger. "We are being penny-wise, pound-foolish because we have no pennies."

Conger, who has also been nominated to be the Defense Department's deputy comptroller, said the Budget Control Act and sequestration have all but quashed DOD's ability to invest in energy efficiency measures and microgrid technology that is critical to energy security, because that funding would have to come from a severely depleted military construction budget. That budget decreased from $14 billion in fiscal 2011 to $5 billion in fiscal 2015, Conger said.

Overall, the Pentagon's $585.3 billion fiscal 2016 budget request is $35 billion over what the Budget Control Act would allow. This year's proposal would include $8.4 billion for military construction.

"As long as we have the BCA and as long as we have sequestration, we won't have the performance we want to see," he said. "We are looking at no-cost, low-cost things we can do, but that won't get us to where we want to go. We are in a monetarily constrained environment, and that's a fact of life right now that does put a damper on all things."

Conger, along with top energy officials for the Army, Navy and Air Force, was speaking at a roundtable event on energy security held by the Pew Charitable Trusts.

DOD has been pioneering energy initiatives over the past four years, the most successful of which has been the goal set by each service to generate 1 gigawatt each of energy from alternative sources by 2020.

The military officials said that goal has been immune from budget cuts only because the services have been leveraging private-sector funds with power purchase agreements and other contracts.

"There is that famous British saying that 'we are out of money, and therefore we are thinking,' and we are thinking a lot about third-party financing," said Dennis McGinn, assistant secretary of the Navy for energy, installations and environment. "I cannot understate the power of that."

Private financing can carry the military's energy initiatives only so far. The Army, Navy and Air Force have each been working with pilot microgrids, which are small-scale versions of a centralized electricity system that allow a base to tap into and out of utility power at a moment's notice. The microgrids are considered a key aspect of energy security, ensuring that installations can keep the lights on during a natural disaster or terrorist attack.

So far, microgrids have been focused on key buildings, and the military has few bases that are entirely on their own microgrids. That's because funding for those grids comes out of the military construction budget, known as MILCON.

"We have a lot of third-party financing for renewables out there, but we need to figure out how to get that to pay for a microgrid," said Deputy Assistant Secretary of the Army for Energy and Sustainability Richard Kidd. "We know how to do it, and we are all ready and willing to get a bigger one out there on an installationwide basis, but in the current budget climate, there is no MILCON."

In some cases, the military is able to use energy-savings performance contracts to upgrade its buildings. Under those agreements, a private contractor does the work upfront, and the military service later pays the contractor back using savings from having more efficient buildings.

But Miranda Ballentine, assistant secretary of the Air Force for installations, environment and energy, noted that such contracts cannot be used for energy efficiency measures in airplanes, which account for $8 billion in energy costs annually.

In order to reduce energy use in operations, Ballentine said, the Air Force has been focusing on maintaining momentum for energy initiatives by changing troop culture.

"That can require some pretty boring stuff, like setting up organizational structures and staffing," she said. "But without it, goals are just goals. Some people are motivated to meet goals, and some people aren't, so you really have to do the boring stuff to maintain that inertia."

AIR POLLUTION:

Volkswagen will replace software in 11M affected cars

Published: Tuesday, September 29, 2015

Volkswagen will replace illegal software in 11 million vehicles in order to move on from its emissions test scandal, the automaker announced today.

New CEO Matthias Müller said that "in the next few days" the company would ask customers to bring their diesel vehicles into dealerships to make the swap, which could cost more than $6.5 billion.

The move is one of the largest recalls by a single company in history. For comparison, the company sold 10.1 million vehicles in 2014.

"We are facing a long trudge and a lot of hard work," Müller said during a gathering of about 1,000 top managers at Volkswagen's Wolfsburg, Germany, headquarters yesterday. "We will only be able to make progress in steps, and there will be setbacks."

Analysts say that in addition to paying for the recall, the company should expect to face fines from regulators and prosecutors and lawsuits from customers who were cheated.

Already, German prosecutors have opened a fraud investigation into the company's former CEO Martin Winterkorn, and Sweden's chief prosecutor said today he was considering starting his own investigation into the company (Andreas Cremer, Reuters, Sept. 29). **-- AW**

HIGH-SPEED RAIL:

Nev. board likely to miss 1st deadline

Published: Tuesday, September 29, 2015

The newly created Nevada High-Speed Rail Authority is likely to miss its first deadline established by enabling legislation.

Senate Bill 457 requires the board to chose a franchisee for the rail line to connect southern Nevada and Southern California by Thursday. But the board's members were selected only in mid-September, and they convene for the first time today.

Though the board may not be ready to officially name a franchisee, many see XpressWest as the only viable candidate. The company's proposal aligns perfectly with the specifications for the system described in the enabling legislation. It would be able to reach sustained speeds of 150 mph and operate on exclusive standard-gauge tracks that could be used by other trains as well.

The legislation's specifications essentially rule out the use of maglev technology (Richard N. Velotta, *Las Vegas Journal Review*, Sept. 28). **-- AW**

INFRASTRUCTURE:

Minn. tests drones to inspect bridges

Published: Tuesday, September 29, 2015

Minnesota officials are testing the use of drones to inspect bridges more safely and cheaply.

Test runs this fall will include putting a drone to work checking the state's longest bridge, Duluth's 7,975-foot John A. Blatnik Bridge. The state already successfully checked four bridges this summer with drones.

"We are just looking at more innovative technologies to help us," said Jennifer Zink, a Minnesota Department of Transportation bridge inspection engineer.

"Using drones could help MnDOT decrease the rising costs of bridge inspection while minimizing risks associated with current bridge inspection methods," Zink said.

Drones could be used to image difficult-to-reach areas on bridges and when hands-on inspections are unnecessary. Furthermore, the unmanned aircraft are much less disruptive to traffic than a truck with an articulated arm holding a basket.

The drones will not replace human inspectors, Zink said, but will be used to assist them.

California has previously considered using drones in 2008 but dropped the idea after tests did not pan out.

Potential issues for Minnesota could include cost and strict Federal Aviation Administration rules, though those are expected to be relaxed (Ron Davis, *Forum of Fargo-Moorhead*, Sept. 28). **-- BTP**

PEOPLE:

4 'genius grant' winners focused on environment, energy

Ben Panko, E&E reporter

Published: Tuesday, September 29, 2015

The John D. and Catherine T. MacArthur Foundation announced its new class of "genius grant" recipients today, with four of 24 fellows doing groundbreaking work in the environmental and energy fields.

One was recognized for his work in pushing hospitals to reduce their environmental impacts; another for working to extract clean water, fertilizers and biofuels from human wastewater; a third for creating a system to make chemicals and natural gas with just water, sunlight and air; and another for working to make complex molecules that could store and generate electricity and integrate them easily into devices.

Fellows are nominated by their peers and chosen by an independent committee based on their creativity and achievements. They receive $625,000 to spend however they choose, with the only requirement being that they are U.S. citizens or residents. Fellows have been chosen in fields ranging from science to arts to business to teaching.

"Their work, their commitment and their creativity inspire us all," MacArthur Foundation President Julia Stasch said.

Helping hospitals help the environment

Gary Cohen, 59, is the president and co-founder of Health Care Without Harm, a group working to get hospitals to pollute less.

"The fact that hospitals were poisoning people and the environment in service of healing them was crazy," Cohen said in a MacArthur Foundation video.

When he founded the group in 1996, he said, more than 4,500 incinerators were in use across the United States for medical waste, and hospitals were the country's largest source of dioxin contamination from burning plastics. Scientists have linked dioxins to increased cancer risk and other negative health effects (*Greenwire*, July 11, 2006). Ten years later, there were just 73 incinerators left, Cohen noted.

Cohen's group also helped end the use of mercury thermometers in the United States and has been pushing hospitals to use products with less toxic flame retardants (*Greenwire*, Aug. 7, 2014).

"They felt compelled to try to address the problems that we were raising for them," said Cohen, whom the White House named a "Champion of Change" in 2013 (*ClimateWire*, July 10, 2013).

Cohen said his group is now focusing on getting the health care industry to embrace renewable energy and help it recognize climate change as a public health crisis.

Making wastewater useful

Kartik Chandran, 41, is an environmental engineering professor at Columbia University, and his research uses bacteria to turn wastewater into not just clean water, but also fertilizers and biofuels.

"Today as a society, we are faced with multiple challenges, including lack of clean water, lack of energy [and] food security, so our philosophy, our vision, is to address these multiple challenges in conjunction and not in isolation," Chandran said in a foundation video.

Human wastewater should be viewed not as something to get rid of, Chandran said, but as a source of energy and nutrients that can be used.

Chandran has teamed up with the Bill & Melinda Gates Foundation to extract methane from human fecal waste in a project in Ghana (*ClimateWire*, June 20, 2011). He envisions that the energy derived from the wastewater could be used to help treat it in underdeveloped countries.

He has also worked to extract nutrients from urine for fertilizer and to create biodiesel from wastewater sludge.

"I basically work on the nexus of water, energy, chemicals and nutrients," Chandran said.

'Artificial leaves'

Peidong Yang, 44, is a chemistry professor at the University of California, Berkeley, who works on creating super-advanced semiconductors that can be used in solar cells and artificial photosynthesis.

Through the use of "nanowires," solar cells can generate electricity much more efficiently, and the technology can also be used to transform waste heat into usable energy.

Yang has also created an "artificial leaf" of nanowires and bacteria that can use sunlight, carbon dioxide and water to create useful chemicals such as butanol or methane with zero carbon emissions (*Greenwire*, April 17, 2015).

"One day, I want to see my basic research fundamentally change the way people live in the future," Yang said in a foundation video.

Precision-design molecules

William Dichtel, 37, is a chemistry professor at Cornell University who is working on ways to integrate complex polymers into devices where they could be used as batteries, organic solar cells and water purifiers.

Covalent organic frameworks are groups of molecules that can be precisely structured to do a variety of tasks, including storing and generating electricity, purifying water and detecting explosives. Dichtel has worked to grow the COFs directly on surfaces as thin films, making them easy to integrate into devices.

"We have nature's toolbox in front of us, and it's just a matter of what should we make and how do we push the limits of these materials even more," Dichtel said in a MacArthur Foundation video.

AIR POLLUTION:

Black business group sides with industry in smog fight

Published: Tuesday, September 29, 2015

The National Black Chamber of Commerce has joined industry voices speaking out against impending restrictions on ozone emissions.

Over the summer, the organization's president, Harry Alford, has toured the country, stopping in multiple cities with smog problems to blast proposed ozone regulations expected to be finalized by U.S. EPA tomorrow.

"Why do we impose these massive arbitrary rules?" Alford asked during a speech in Pittsburgh.

Though Alford's opposition to the regulation, which is in line with the stance of the National Association of Manufacturers, may seem counterintuitive, he has long been critical of EPA.

Alford founded the National Black Chamber of Commerce in 1993 and has criticized the agency in blog posts ever since, calling it a "monster" and accusing it of falsely claiming that minorities are disproportionately affected by pollution.

"Many naive blacks have bought the lie -- hook, line and sinker," he wrote.

His stance has angered many environmental justice groups that say fighting pollution would benefit minorities.

"The dirtiest utility plants pollute and hurt black communities," said Evlondo Cooper, a researcher for the Checks and Balances Project. "He doesn't speak for black people, and nothing about his support for the fossil-fuel lobby or his attacks on clean energy has been helpful to our community."

Alford declined to comment but has previously boasted about his organization's being backed by Exxon Mobil Corp. and other fossil fuel interests.

"I think you can have a balance," he told a Pittsburgh radio station earlier this month. "What's unfair is that the rules and targets keep changing" (Joby Warrick, *Washington Post*, Sept. 28). **-- AW**

INTERNATIONAL:

Maldives' foreign secretary discusses outlook for island nations in Paris talks

Published: Tuesday, September 29, 2015

As an island nation, the Maldives has a unique climate change story. How is the Maldivian government working to mitigate the impacts of climate change, and what requests is it making of the international community as the next climate agreement is crafted? During today's OnPoint, Ali Naseer Mohamed, foreign secretary of the Maldives, discusses the impact of political instability and the threat of sanctions on his country's ability to combat the effects of climate change.

AN E&E PUBLISHING SERVICE

AIR POLLUTION:
Panel demands info from EPA, Volkswagen on emissions scandal

Sean Reilly, E&E reporter

Published: Wednesday, September 30, 2015

The House Energy and Commerce Committee yesterday asked Volkswagen and U.S. EPA for a broad array of information related to the automaker's admitted scheme to sidestep air pollution regulations.

Among the documents sought from Volkswagen: anything related to development and approval of the software that the company employed in almost a half-million diesel-powered cars to evade emissions requirements by applying full controls only when the car was being tested. The committee is also seeking all communications with EPA and the California Air Resources Board in which the company sought to explain "potential non-compliance" with federal and state standards.

Energy and Commerce Chairman Fred Upton (R-Mich.) and ranking member Frank Pallone (D-N.J.) made the request in a **letter** sent yesterday to the head of the company's U.S. subsidiary.

The letter sets an Oct. 13 deadline for Volkswagen to hand over the requested records, preceded by a staff briefing by Friday.

From EPA, lawmakers also want a staff briefing this week outlining how and when the Clean Air Act violations were discovered and how agency employees considered addressing the issue via recalls and "technical solutions," the **request** to Administrator Gina McCarthy indicates.

Also signing the letters were Reps. Tim Murphy (R-Pa.) and Diana DeGette (D-Colo.), the chairman and ranking member, respectively, of the Energy and Commerce Subcommittee on Oversight and Investigations, which plans a yet-to-be-scheduled hearing on the fraud.

A Volkswagen spokesman did not immediately reply to an email late yesterday asking whether the company expects to meet the Oct. 13 deadline. An EPA spokesman said the agency would work with the committee on its request.

RANKING MEMBER

ONE HUNDRED FOURTEENTH CONGRESS

Congress of the United States

House of Representatives

COMMITTEE ON ENERGY AND COMMERCE
2125 RAYBURN HOUSE OFFICE BUILDING
WASHINGTON, DC 20515–6115
Majority (202) 225–2927
Minority (202) 225–3641

September 29, 2015

The Honorable Gina McCarthy
Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue, NW
Washington, DC 20460

Dear Administrator McCarthy:

On September 18, 2015, the Environmental Protection Agency (EPA) notified Volkswagen AG, Audi AG, and Volkswagen Group of America, Inc. (collectively, VW) that the agency "determined that VW manufactured and installed defeat devices" in certain model year Volkswagen and Audi diesel passenger cars. The "defeat devices" took the form of software, according to the agency, that "sensed" when the vehicles were undergoing emissions testing and ensured emissions control systems were operating to pass the tests. During normal vehicle use, according to the agency, the software would "switch" to a different mode that produced certain emissions 10 to 40 times above EPA standards and in violation of the Clean Air Act. The scope of the alleged violations — affecting some 480,000 vehicles according to news reports — and EPA's assertion that VW admitted it "designed and installed" defeat devices in these vehicles, raise serious questions about VW's efforts to comply with its statutory obligations under the Clean Air Act. On September 25, EPA subsequently notified all vehicle manufacturers that the agency will be conducting "additional evaluations designed to look for potential defeat devices."

The Committee on Energy and Commerce and its Subcommittee on Oversight and Investigations are investigating (a) the facts and circumstances surrounding VW's use of software in vehicle emissions control systems to affect Clean Air Act related compliance and emissions test results and (b) the EPA's role in oversight and enforcement of these statutory obligations. To assist the committee with its investigation, and pursuant to Rules X and XI of the U.S. House of Representatives, we request that you provide a full briefing to committee staff to address the following areas:

1. A detailed timeline of events and activity related to the violation(s) by VW outlined in EPA's Notice of Violation dated September 18, 2015, including

    a. How and when the violations were discovered;

b. VW's efforts to respond to EPA and the California Air Resources Board's (CARB) requests to explain potential noncompliance with EPA or California standards and emissions test requirements;

c. Previous deliberations concerning any recalls and technical solutions initiated or considered to address EPA and CARB's initial concerns prior to the notice of violation;

d. Current deliberations concerning recalls and technical solutions to address the violation.

2. An overview of EPA's process to recall vehicles found to be in violation of the Clean Air Act with respect to emissions control systems.

3. The process by which EPA communicates with state clean air agencies (including CARB), auto manufacturers, and consumers regarding vehicles suspected to be in violation of the Clean Air Act.

4. A detailed description of all testing EPA requires and reviews prior to granting a certificate of conformity, EPA's process of evaluating this information, and what review or testing is conducted by EPA, or on its behalf, to validate information provided by manufacturers.

5. EPA's September 25, 2015, notice to manufacturers that the agency will be conducting additional evaluations designed to look for potential defeat devices.

We request that you arrange to provide this briefing with committee staff to occur by October 2, 2015. If you have questions regarding this request, please contact Peter Spencer or John Ohly of the majority committee staff at (202) 225-2927 or Elizabeth Letter or Ryan Gottschall of the minority committee staff at (202) 225-3641.

Sincerely,

Fred Upton

Hi Jeff,

The University of Tennessee Baker Center plans to release the attached report tomorrow. Please note that the editors are still working to make some of the report graphics clearer, but the text of the report will remain unchanged. I will send you the UTBC press release and the final report when I have it.

We (ORNL) have had an inquiry about this report from Christie St. Clair of EPA's Office of Public Affairs in Washington, D.C. Morgan McCorkle from ORNL Communications and Media Relations is working with Christie to provide her with information about the report.

Please call or e-mail me if you have any questions or wish to discuss this.

Thanks!

Subject: Final EPA comments on UT MPG paper

Bo, as requested, here are our final comments on the draft paper. We greatly appreciate the chance to review this draft paper, and that the authors made several changes in response to our previous comments. I believe that the paper reads much better than before, and I hope the authors do too.

We are providing a few final comments in the attached file. The two most important comments are single sentences that we suggest adding to the abstract (page 1) and conclusions (p. 30). In both cases, it is important for the reader to understand that EPA "saw this coming" and changed our labeling and rulemaking benefits methodologies several years ago. Absent this context, many readers will assume that EPA was oblivious to the increasing gap that the paper suggests. This important context is extremely timely given the great amount of media attention on the recent Volkswagen violations. If it is not possible to add these sentences to the abstract and conclusions sections, please let me know as soon as possible.

Thanks again to you and the authors.

Hi Lisa,

The authors of the University of Tennessee/Oak Ridge National Laboratory MPG study have reviewed the EPA staff comments you provided on August 21 (see below) and have prepared responses to those comments as well as a revised report based on the comments (see attached). We appreciate the EPA staff taking the time to review the original report and provide detailed comments, as we believe the review comments have improved the report and will make it more useful to consumers.

I would appreciate receiving any final comments on this revised report by **Monday, September 28**. In the meantime, if you have any questions or comments to discuss, please e-mail or call me.

Thanks again!

Subject: EPA comments on UT MPG paper

Bo,

Thanks for sending us the revised August 5 draft.

Attached is a copy of the June 22 draft that you had sent previously, with about 25 comments from OTAQ, all in comment boxes. We worked from the June 22 draft because most of our review was completed prior to receiving the August 5 draft. Based on a quick look at the August 5 draft, it appears that, with the exception of one important section that was modified somewhat, most of the paper is unchanged, so all or nearly all of our comments should still be relevant to the August 5 draft. Our written comments are consistent with the discussion during the conference call on July 22. Specific questions about any of our comments are best directed to Jeff Alson at 734-214-4296 or alson.jeff@epa.gov, who led our review.

Our biggest concerns are:

1) the suggestion that EPA may have overestimated the benefits of the recent GHG/CAFE rulemakings; this suggestion seems to be based on incorrect assumptions of how the benefits analysis was performed, and

2) many examples where the wording is critical of the label and consumer information programs that ORNL, DOE, and EPA have worked so hard to improve over the last 40 years, in ways that we feel are incorrect or misleading.

Most of our comments specifically address these two areas, though there are also a few that flag factual errors as well.

Our concerns are significant and we would respectfully ask that we be allowed to review a revised draft prior to any plans to publish the paper. I would like to stress that we very much are in favor of program assessment and critical analyses that can be used to improve these important consumer information programs, and hope that this paper can be revised in order to contribute to

that goal.

Thank you very much for the opportunity to review the draft paper and to submit comments.

Abstract

U.S. government fuel economy tests are used for two primary purposes: 1) to monitor automobile manufacturers' compliance with fuel economy and greenhouse gas emissions standards and 2) to inform consumers about the fuel economy of passenger cars and light trucks. This study analyzes a unique database of 75,000 fuel economy estimates self-reported by customers of the U.S. government website www.fueleconomy.gov to evaluate the effectiveness of the government's estimates for these two purposes. The analysis shows great variability in individuals' own fuel economy estimates relative to the official government estimates, but much smaller bias relative to the sample average. For consumers, the primary limitation of government fuel economy estimates is their uncertainty for a given individual rather than bias relative to the average individual. The analysis also examines correlations between individuals' fuel economy estimates and specific technologies, vehicle class, driving style, method used to calculate fuel economy, manufacturer, and state. There is some evidence that the shortfall between test cycle fuel economy estimates (used to measure compliance with regulations) and in-use fuel economy estimates (such as those provided by customers of www.fueleconomy.gov) has been increasing since 2005. The direction and magnitude of the trend is consistent with changes made by the Environmental Protection Agencies to its methods for calculating the benefits of the standards in the 2010 and 2012 rulemakings. However, if the trend continues, it could affect the benefits realized by fuel economy and greenhouse gas emissions standards. A scientifically designed survey of in-use fuel economy is needed to insure that an unbiased sample is collected and that fuel economy is rigorously and consistently measured for all vehicles. The potential for information technology to reduce the uncertainty in predicting individuals' on-road fuel economy should be explored.

I. Introduction

The window sticker of every new passenger car or light truck sold in the U.S. bears a label with a prominently displayed government fuel economy rating. The intent is to provide consumers with consistent and reliable information they can use when comparing vehicles. Each label also contains the following caveat: "Actual results will vary for many reasons, including driving conditions and how you drive and maintain your vehicle." Differences between consumers' experiences with fuel economy and label values have been a source of discussion and dissatisfaction with the official government ratings since shortly after they were first introduced in 1975 (McNutt et al., 1978).

The U.S. Environmental Protection Agency (EPA) provides two sets of fuel economy estimates ("test cycle" and "label") for every make, model, engine and transmission configuration of passenger car and light truck sold in the U.S.[1] These estimates are important for two main reasons: (1) to enforce the Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emissions regulations for light-duty vehicles (EPA, 2012) the government needs test cycle estimates that are equitable to manufacturers, repeatable and proportional to real world experience and (2) consumers need accurate fuel economy estimates to make informed choices when buying vehicles.

1 In fact, most vehicle testing is done by the vehicle manufacturers, who certify to the EPA that the tests have been done in accordance with government procedures. The EPA tests 15-20% of vehicles each year to verify compliance (EPA, 2014a).

VW FOIA, EPA 06/20/2017 2017-FFP_027985

In statistics, the terms accurate, precise and unbiased have specific, mathematical definitions. Accuracy measures the closeness of agreement between repeated measures of a given quantity and its true value. Precision measures the closeness of agreement between repeated measures of a given quantity and the mean of those measures. Bias measures the difference between the mean of a series of measurements or predictions and the true value of a quantity or the true mean of a population. The situation is somewhat different for government fuel economy estimates. A single number (e.g., a car's fuel economy label number) is proposed as a useful estimate of the actual fuel economies of all motorists using the same vehicle[2]. In this case, there is no "true value" but rather a distribution of values for individual drivers. Assuming that the government fuel economy estimate is intended to correspond to the average fuel economy of all drivers of a given vehicle, bias can be defined as the difference between the official estimate and the mean of the population.[3] Because there are not repeated measurements for an actual or even hypothetical true value of fuel economy, how to define accuracy and precision is less clear.[4] In this paper we will quantitatively describe the deviations of individual motorists' estimates from their vehicle's fuel economy rating as *variance*. At the same time, we recognize that from an individual motorist's perspective, the official rating might be perceived as biased or inaccurate.

The government is well aware of the issue of the variance of individual fuel economy results. Every fuel economy label contains the following caveat:

> "Actual results will vary for many reasons, including driving conditions and how you drive and maintain your vehicle."

It is quite possible for fuel economy ratings to be unbiased (reasonably predict the average fuel economy of all motorists) but poor predictors of the experiences of individuals. For the purposes of testing compliance with fuel economy standards, unbiased fuel economy estimates would be sufficient. If the expected fuel economy improvements are realized on average, the expected benefits in petroleum and greenhouse gas (GHG) reductions will be achieved. In fact, all that is necessary for the expected benefits to be realized is that a given percent increase in miles per gallon (MPG) on the test cycle produce the same percentage increase in on-road fuel economy. On the other hand, for the fuel economy label estimates to be of greatest value to consumers' car purchase decisions, they should accurately predict the fuel economy an individual will experience on the road. This is clearly not achievable with a single-number rating for each vehicle. However, modern information technology might possibly enable relatively accurate prediction of individuals' fuel economy.

The test cycle fuel economy estimates used to determine manufacturers' compliance with regulations are based on laboratory testing of vehicles over two (city and highway) driving

2 Here, a vehicle means a unique vehicle as defined for regulatory purposes, typically a specific configuration of make, model, model year, engine and transmission.

3 When fuel economy is measured in miles per gallon, the simple average of the fuel economies of a population of drivers will not equal the sum of all miles driven divided by the sum of all gallons consumed. The harmonic mean of the individual fuel economies, weighted by each vehicle's miles traveled will.

4 A single estimate for a range of values is absolutely precise because its variance is zero. On the other hand, it is inherently inaccurate; the only question being how inaccurate it is.

cycles as required by statute. These drive cycles have been in use since the Corporate Average Fuel Economy (CAFE) standards were enacted in 1975. The label fuel economy estimates provided on the window stickers of new vehicles and used in advertising and the media are based on five drive cycles, adjusted in an attempt to reflect average U.S. on-road experience. The five cycles include the "city" and "highway" cycles used to determine compliance with fuel economy and greenhouse gas emission standards plus additional cycles that reflect, 1) more aggressive driving behavior, 2) the impact of operating under colder ambient conditions and, 3) the impact of air conditioner use.

This study addresses how well the test cycle and label estimates serve their intended purposes though a statistical analysis of approximately 75,000 individual fuel economy estimates voluntarily submitted to the "My MPG" section of the government website www.fueleconomy.gov. The relationship between individuals' own fuel economy estimates (My MPG) and the EPA label estimates is analyzed to determine whether the adjusted EPA estimates are unbiased and to measure the variability of consumers' experiences relative to the label numbers. The relationship between individuals' My MPG estimates and EPA test cycle estimates is examined to shed light on whether the ratio of test cycle to on-road MPG has been changing with succeeding model years. A continually increasing gap would imply that the government's fuel economy standards might not achieve as much reduction in oil use and GHG emissions as intended.[5] The need to monitor on-road fuel economy was recognized by the Environmental Protection Agency (EPA) and the National Highway Traffic Safety Administration (NHTSA) in their fuel economy and greenhouse gas rule for light-duty vehicles.

> "The agencies recognize the potential for future changes in driver behavior or vehicle technology to change the on-road gap to be either larger or smaller." (Federal Register, 2012, p. 62715)

The agencies assumed that a gap of 20%, which is consistent with fuel economy labeling, would continue through 2025, with minor adjustments for fuel energy content (EPA, 2012, pp. 4-1 to 4-7). This represents an increase of 5% over the 15% gap that had been assumed in previous EPA analyses.

The impacts of fuel efficient technologies such as turbo-charging and transmissions with higher gear counts are estimated to see if they perform better or worse on the road in comparison to the test cycles. The analysis also attempts to take into account driving conditions that vary from state to state and other factors that might influence on-road fuel economy.

The scope of this study is limited to light-duty vehicles with conventional gasoline (gasoline), gasoline-electric hybrid (hybrid), and diesel powertrains due to the nature of the data available from www.fueleconomy.gov .

5 The agencies' rulemaking assumes the gap will remain at 20% through 2025, with some minor adjustments for fuel energy content and air conditioner efficiencies (EPA, 2012, pp. 4-2 to 4-7).

VW FOIA, EPA 06/20/2017 2017-FFP_027987

II. Previous Research

When the EPA fuel economy estimates were first introduced in 1975, they were not adjusted for real-world driving conditions. Concern about the ability of the test cycle estimates to measure on-road fuel economy motivated assessments by government, industry and consumer groups. In the first year the CAFE Standards took effect (1978), researchers at the U.S. Department of Energy (DOE) published an analysis of over 5,000 fuel economy records for model year 1974 to 1977 vehicles, obtained from a variety of sources (McNutt et al., 1978). Noting that the test cycle estimates were "fairly representative" of the on-road values for the 1974 model year, the researchers observed a trend of increasing shortfall.

> "However, beginning in the 1975 model year and continuing through 1977 (the limits of existing data) the EPA certification values become an increasingly poorer representation of actual on-road fuel economy."

They estimated that the average shortfall had increased from 4% in model year 1974 to about 20% for model year 1977.

In 1980 and 1981, General Motors (GM) conducted surveys of private owners of 1981 model year vehicles and asked them to record odometer readings and fuel purchases at their next four fill-ups (Schneider et al., 1982). From the 38,466 forms mailed out in the 1981 survey, 4,923 (12.8%) usable responses were received. The EPA test cycle combined fuel economy estimate for the vehicles was 25.5 miles per gallon (MPG) while the respondents' average on-road fuel economy was 22.0 MPG, implying a shortfall of almost 14%. The earlier 1980 survey had produced an estimated shortfall of just over 16%. Front-wheel drive vehicles averaged a 6.4% smaller shortfall than rear-wheel drive vehicles, diesels had a 6.5% smaller shortfall than gasoline vehicles, and manual transmissions had 7.2% higher on-road fuel economy than automatic transmissions.

A study by Ford based on data from employees who leased Ford vehicles found that the shortfall for 1978 model year vehicles averaged 20%, but for 1979 and later model year vehicles, the shortfall was relatively stable at about 14% (McKenna and South, 1982). The Ford study also found that the shortfall for winter driving was 10% greater than for summer driving.

Analyzing a much larger data base of 56,395 vehicles amassed from a variety of sources, McNutt et al. (1982) found large variations in the fuel economy shortfall by model year but no consistent trend over time. They also found important differences between passenger cars and light trucks, rear-wheel drive and front-wheel drive vehicles, and manual and automatic transmissions. Their data showed a strong tendency for the percent shortfall to increase with increasing fuel economy. Overall, they estimated a shortfall of 21% for model year 1981 vehicles. Having quantified variations in the shortfall by technology, vehicle class, model year and make and model, the study was the first to analyze the implications of uncertainties about on-road fuel economy for car buyers:

> "These impacts include the inability of new car buyers to accurately compare different

model vehicles and the difficulty in projecting future fuel demand based on the EPA values."

These studies and other evidence led the U.S. EPA to adjust downward the fuel economy estimates reported to the public on window stickers and in advertising (Hellman and Murrell, 1984). A vehicle's fuel economy estimate on the city test cycle was multiplied by 0.90 and its highway cycle estimate was multiplied by 0.78. The effect on a typical vehicles combined[6] fuel economy estimate was approximately a 15% reduction relative to the test cycle numbers. However, the unadjusted test cycle numbers continued to be used to determine compliance with fuel economy standards, as required by statute, and they still are today.

At least one subsequent analysis of on-road fuel economy suggested that the on-road shortfall might have increased since the 1984 study. Mintz et al. (1993) analyzed data from the Energy Information Administration's (EIA) 1985 Residential Transportation Energy Consumption Surveys (RTECS). RTECS collected gasoline purchase and odometer reading diaries from 3,891 households representing 8,401 vehicles. Comparing the on-road estimates to the unadjusted EPA test cycle MPG values, they found a shortfall of 18.7% for passenger cars and 20.1% for light trucks, somewhat larger than Hellman and Murrell's (1984) 15%.
